

CipherTrust Cloud Key Manager for SAP Applications in Google Cloud Platform Providing Bring Your Own Key 'BYOK' and Cloud-native Key Management

The Business Challenge

As enterprise data and workloads continue to migrate to the Google Cloud Platform (GCP), the need to keep sensitive data secure continues to grow. In a recent IDC Data Threat Report study, 50% of all corporate data is stored in the cloud of which 48% of that data is considered sensitive. With a significant footprint across the large enterprise community, SAP figures meaningfully in GCP migration discussions – both for the volume of customers that trust SAP applications and for the type of sensitive data they use.

While GCP offers encryption and other data protection schemes to support migration efforts, best practices, regulations, and government policies are increasingly requiring a level of sovereignty in data protection. Ultimately, organizations must keep control of their keys separate from the data they secure. Google and SAP address these requirements through various Bring Your Own Keys (BYOK) design architectures that enable the companies owning the workloads to control their encryption keys and their workloads. The separation of data from encryption keys provides the sovereignty they need to ensure that their data can remain securely within the confines of a specific geography and that their sensitive data in GCP is useless even if it is accessed by unauthorized users.

In addition to this, the flexibility and benefits of a multi-cloud deployment also increase the complexity of managing encryption keys across the enterprise's workloads. Managing the lifecycle of both BYOK keys kept within the enterprise, and cloud-native keys kept in GCP is complicated and time-consuming. Silos of cloud encryption keys makes IT administration more difficult and complicates the reporting needed to establish regulatory compliance.

When taken all together, these challenges can present serious obstacles to customers moving their SAP investments into GCP. Fortunately, SAP and Thales are working together to address these challenges for our customers.

The Solution

Thales and SAP now offer external, multi-cloud key lifecycle management for SAP applications. With the integration between SAP's Data Custodian and Thales' CipherTrust Cloud Key Manager, organizations can seamlessly manage the encryption key life cycle of SAP applications on GCP from the same pane of glass as their other cloud encryption implementations. The SAP Data Custodian offers integrated visibility and security functionality in addition to key management to secure GCP-based SAP data. By adding CipherTrust Cloud Key Manager, highly-regulated customers can externally root their encryption keys in a purpose-built hardware appliance, or generate their own encryption keys to be used by their SAP applications.

Features and Benefits

- Generate encryption keys with HSM based entropy and bring them to your SAP applications on GCP
- Make encryption administration easier with centralized key lifecycle management across multiple cloud environments
- Comply with the most stringent data protection and sovereignty mandates with encryption and key management
- Simplified compliance reporting with detailed audit logs and prepackaged reports
- Root keys in up to FIPS 140-2 Level 3 security by leveraging CipherTrust Manager or Thales Luna HSMs

In Summary

Whether they choose to take advantage of SAP's native security functionality or bring their own keys to the encryption conversation, CipherTrust Cloud Key Manager simplifies ongoing administration and eases the burden of demonstrating regulatory compliance.

Together, SAP and Thales make it easy to demonstrate data sovereignty for SAP workloads on GCP through encryption key control and key lifecycle management via an intuitive 'single pane of glass.'

About Thales

The people you rely on to protect your privacy rely on Thales to protect their data. When it comes to data security, organizations are faced with an increasing number of decisive moments. Whether the moment is building an encryption strategy, moving to the cloud, or meeting compliance mandates, you can rely on Thales to secure your digital transformation.

Decisive technology for decisive moments.

About SAP

Headquartered in Walldorf, Germany, SAP is the world's largest inter-enterprise software company, and the world's third-largest independent software supplier overall. SAP employs over 28,909 people in more than 50 countries. Their professionals are dedicated to providing high-level customer support and services. For more information, visit www.sap.com.

Product Brief

CipherTrust Cloud Key Management

thalestct.com

THALES
Building a future we can all trust

Industry best practices as defined by the Cloud Security Alliance (CSA) require that keys be stored and managed outside of the cloud service provider and the associated encryption operations¹. Cloud Service Providers (CSPs) can comply with best practices by offering Bring Your Own Key (BYOK) or Hold Your Own Key (HYOK) services to enable customer control of the keys used to encrypt their data. Customer control of the keys allows for the separation, creation, ownership and control, including revocation, of encryption keys or tenant secrets used to create the keys.

CipherTrust Cloud Key Management (CCKM) increases efficiency by reducing the operational burden—even when all of the cloud keys are native keys. Giving customers lifecycle control, centralized management within and among clouds, and visibility of cloud encryption keys reduces key management complexity and operational costs. Customers report that they stepped away from managing keys across a heterogeneous environment and invested in CCKM to enable them to move securely to the cloud—and their cloud use is growing exponentially, reducing management overhead and the potential for security holes.

Control Cloud Encryption Keys

- Leverage the value of BYOK and HYOK services with full-lifecycle cloud encryption key management
- Gain higher efficiency with centralized key management across hybrid, single- and multi-cloud environments, including key discovery, management of native cloud keys and automated key rotation
- Comply with the most stringent data protection mandates with secure key origination
- Amplify the benefits of native keys by using a robust multi-cloud platform with outstanding UI

Best Practices

Industry and internal data protection mandates require increasing protection for sensitive cloud data. Meanwhile, CSA and industry analysts state that cloud encryption keys should be managed by customers. Key management systems (KMSs) can grow to hundreds of master keys per KMS—requiring knowledge of how, when, and by whom encryption keys are used, in addition to backing up, monitoring, rotating, expiring, archiving, suspending, restoring, and destroying keys as needed. CCKM provides comprehensive key lifecycle management to provide visibility on a single pane of glass, and automate and fulfill requirements for safe, comprehensive key management across multiple clouds.

Improved Efficiency

CCKM offers multiple capabilities in support of increasing efficiency:

- Secure centralized key management for Native, BYOK and HYOK cloud keys from a single browser window, across multiple clouds, regions, accounts, subscriptions, projects, applications, org ids, etc.
- Automated synchronization ensuring that cloud console-specific key operations are visible in centralized key management—even if you have already created thousands of native cloud keys at your cloud provider
- Automated key rotation with support for expiring keys ensuring compliance while saving valuable time
- Metadata is collected and laid out in the same order for every cloud provider, removing the need to look for data in disparate places

Single Pane of Glass

Access to each cloud provider from a single console, across multiple accounts, regions, subscriptions and projects makes it easier for organizations to understand how their workloads across different clouds are protected. We continually increase key visibility to make it easier for administrators to manage and control access to the keys in minutes instead of days, and stop threats faster.

Strong Encryption Key Security

Customer key control requires secure key generation and storage. CCKM leverages the security of the CipherTrust Manager, Luna Network HSM, or the Vormetric Data Security Manager (DSM) to create keys with up to FIPS 140-2 Level 3 security.

Hold Your Own Key

CCKM services respond to encryption key requests from cloud providers, supporting many of the emerging HYOK offerings: AWS External Key Store (XKS); Google Cloud External Key Management (EKM), Google EKM Ubiquitous Data Encryption (UDE), and Google Workspace Client-side Encryption for Drive, Gmail, Google Calendar and Google Meet; Microsoft DKE, OCI EKMS, and Salesforce Cached Keys.

¹ See CSA CCM EKM-04.

The Compliance Tools You Need

Visibility reports demonstrate compliance to the regulator for mission-critical workloads. Logs may also be directed to a syslog server or Security Information and Event Management (SIEM) tool.

Automation Tools Support Your Initiatives

CCKM capabilities are available programmatically using RESTful APIs, enabling the power of centralized cloud encryption management to work with your automation and self-service initiatives. Interactively explore the APIs with our built-in API playground.

Flexible Deployment Options

Deployment environments include: public cloud, private cloud, hybrid cloud, physical appliances and an as-a cloud-based subscription service.

Regardless of how and where CCKM is deployed, CCKM can manage keys and access to the keys, in any supported cloud.

To meet different organization’s needs, CCKM is available in virtual and physical form factors: Virtual CCKM is an all-software offering easily deployed and can be run in the cloud or on premises and may be found in several cloud provider marketplaces for fast instantiation. Physical appliances are available for customers who prefer an on-prem solution. CCKM service is available on-demand through the Thales Data Protection on Demand (DPoD) marketplace and in CSP marketplaces.

Multi-cloud Data Security Solutions

CCKM simplifies the need to control and manage encryption keys for cloud services, a critical solution for fulfilling industry and organizational data protection mandates. CCKM and many additional Thales multi-cloud security products, including various Bring Your Own Advanced Encryption offerings, all with centralized key management, offer you choices on how best to protect all your cloud data. It’s your data in their cloud.

Supported clouds and key management ownership models:

About Thales Trusted Cyber Technologies

Thales Trusted Cyber Technologies, a business area of Thales Defense & Security, Inc., is a trusted, U.S. provider of cybersecurity solutions dedicated to U.S. Government. We protect the government’s most vital data from the core to the cloud to the edge with a unified approach to data protection. Our solutions reduce the risks associated with the most critical attack vectors and address the government’s most stringent encryption, key management, and access control requirements.

CipherTrust Cloud Key Manager (CCKM)

This document explains how to:

- Add AWS KMS accounts, Azure vaults, Luna HSM partitions, DSM domains, Google Cloud key rings, Salesforce organizations, SAP Data Custodian groups, Oracle Cloud Infrastructure (OCI) vaults, OCI External Key Management (EKM) (or external) vaults, CipherTrust (external) domains, SAP EKM to CCKM
- Manage AWS, Azure, Luna HSM, DSM, Google CMEK, Google Cloud EKM keys, Salesforce tenant secrets, SAP, OCI keys, OCI EKM keys, CipherTrust (external) keys, Microsoft Double Key Encryption (DKE) endpoints, SAP EKM keys on CCKM
- Manage AWS custom key stores on CCKM
- Schedule key rotation for AWS, Azure, Google Cloud, Salesforce, SAP, SAP EKM, Microsoft DKE, and OCI keys
- Schedule key refresh for Luna HSM, DSM, AWS, Azure, Google Cloud, Salesforce, SAP, and OCI keys

It is assumed, for this document, that you have already configured the CipherTrust Manager appliance. Refer to the [CipherTrust Manager Deployment Guide](#) for instructions.

The next step is to activate and install the CCKM license. Refer to [Licensing](#) for details.

Workflow

This section outlines the general process for managing keys with CCKM. Note that the specific steps for HYOK resources may vary; consult their respective documentation for details.

1. **Add a connection** between the CipherTrust Manager and the desired cloud or key source. Refer to [Connection Manager](#) for details.

This is needed to grant CCKM the access to any of the cloud service or key source users with valid user credentials.

2. **Test the connection.** The connection must be in the ready state.
3. **Add the container** that contains the keys to be managed. A container can be:
 - An AWS account
 - An Azure vault
 - An external CipherTrust Manager domain
 - A Luna HSM partition
 - A DSM domain

-
- A Google Cloud key ring
 - A Salesforce organization
 - A SAP group
 - An OCI vault

When adding a container, you need to select the corresponding connection.

4. **Refresh the container** to download its keys to CCKM. Refreshing a container might take significant amount of time depending on the number of keys stored in it.

CCKM provides options to refresh keys of an individual or all containers of a cloud service or key source.

After a container is refreshed successfully, the downloaded keys can be managed on CCKM itself.

5. **Manage keys.** With CCKM, you can perform supported key operations such as adding, editing, and rotating keys.

CCKM also provides options to schedule key operations and generate reports for the supported clouds. Refer to relevant sections in the [CCKM Administration](#) and [CCKM API](#) documentation for more details about the steps listed above and other CCKM features.

Overview

CipherTrust Cloud Key Manager (CCKM, also referred to as CCKM Embedded) centralizes the management of key life cycle for various cloud services providers. The CCKM complies with data security mandates in cloud storage environments while retaining the custodianship of the encryption keys. Enterprises can back up keys on-premise, destroy keys when no longer needed, and manage the entire life cycle of the cloud keys.

The following diagram shows the high level CCKM overview:

CCKM Components

The CCKM solution comprises the following components:

- CCKM GUI on the CipherTrust Manager for administrators and users
- At least one of the supported clouds
- A supported trusted key source
- A supported Internet browser

The product is delivered as a licensed component of the CipherTrust Manager appliance that can be installed on any one of the supported deployment methods.

Supported Clouds

- Amazon Web Services (AWS)
 - AWS China

-
- AWS GovCloud
 - Azure Cloud
 - Azure China Cloud
 - Azure US Government
 - Google Cloud
 - Oracle Cloud
 - Salesforce
 - Salesforce Sandbox
 - SAP Data Custodian

Note

- AWS China cloud does not support uploading 256-bit keys. It supports 128-bit keys only. CCKM automatically uploads 128-bit keys to the AWS China cloud through the GUI. Other AWS clouds support upload of 256-bit keys.
- AWS China cloud does not support creation of native asymmetric keys.
- Azure China cloud requires that the CipherTrust Manager and automated systems are deployed in the same VPC and subnet.

Supported Cloud Services

- AWS Customer Managed CMKs
- AWS Custom Key Stores
 - AWS CloudHSM Key Stores
 - External Key Stores (XKS)
- Azure Cloud BYOK
- Azure Key Vault Managed HSM
- Azure Stack (Azure Active Directory, Azure AD)
- Azure Stack (Active Directory Federation Services, AD FS)

-
- Google Workspace Client Side Encryption (CSE)
 - Google Cloud CustomerManaged Encryption Keys (CMEK)
 - Google Cloud External Key Manager (EKM)
 - Google Ubiquitous Data Encryption (EKM+UDE)
 - Microsoft Double Key Encryption (DKE)
 - Oracle Cloud Infrastructure (OCI) (BYOK)
 - OCI External Key Management Service (EKMS)
 - Salesforce Bring Your Own Key (BYOK)
 - Salesforce Cache-Only Key Service
 - SAP Data Custodian Key Management Service (BYOK)

Supported Key Sources

CCKM uses the following as the trusted key sources for the encryption keys employed within the supported clouds:

- **CipherTrust Manager**
- **External CipherTrust Manager**
- **Azure Dedicated HSM**
- **Luna Network HSM** (referred to as Luna HSM in this document): This release supports:
 - Luna Network HSM Software and Firmware versions v7.3.x and higher.
 - PED and Password-based HSM configurations.
 - Import of RSA-4096 keys from Luna HSM Software and Firmware versions 7.4.x and higher.
 - Symmetric and asymmetric keys with Luna HSM.

Note

- CCKM doesn't support FM-enabled Luna HSM as a key source.

- **TCT Luna T-Series Network HSM**: The release supports:
 - The TCT Luna T-Series Network HSM uses software version 7.13.2 and firmware version 7.11.2.

Note

- In the CCKM documentation, the HSM referred to as a key source includes both the Luna Network HSM and the TCT Luna T-Series Network HSM.

- **Data Security Manager (DSM):** This release supports DSM v6.4 Cumulative Patch 3 and higher.

Note

Data Security Manager (DSM) is EOL as of June 2024 and its support as a key source is being deprecated.

The CipherTrust Manager supports all clouds that CCKM supports. The CipherTrust Manager stores its own keys and the backup keys from the supported clouds.

Note

On the CipherTrust Manager, CCKM cannot manage source keys created on the CCKM Appliance v1.x.

Supported Deployment Methods

The CCKM is delivered as part of the CipherTrust Manager appliance. So, CCKM can be automatically deployed with the deployment of the CipherTrust Manager in the following supported environments:

- Amazon Web Services
- Google Cloud Platform
- Microsoft Azure
- Oracle Cloud
- Private Clouds - Oracle VMware vSphere, Microsoft Hyper-V, and OpenStack
- Physical Appliances

Refer to the [CipherTrust Manager Deployment Guide](#) for the complete list of supported environments and deployment instructions.

Supported Internet Browsers

The CCKM supports the following Internet browsers:

-
- Chrome 51.0.2704 (64-bit) or later
 - Firefox 45.0 or later
 - Microsoft Edge 91.0.864.37 or later

CCKM Functionality

The CCKM provides following functionalities for the supported cloud services:

- Life cycle management of keys, key versions, and attributes:
 - View Keys
 - Update Keys
 - Upload Keys
 - Rotate Keys
 - Delete Keys
- Disaster recovery of keys:
 - Backup Keys
 - Restore Keys
- Hybrid key management:
 - On-premise keys storage
 - Management of both keys originating from trusted key sources and cloud-provider-sourced keys
 - Key synchronization
- Compliance management:
 - On-premise key storage with up to FIPS 140-2 Level 3 certification (CipherTrust Manager K570 with K7 card, Luna Network HSM, DSM)
 - Key storage in public or private clouds, inaccessible to cloud services with FIPS 140-2 Level 1 (Luna Network HSM, DSM)
- Key visibility reporting:
 - Key Activity Report: Inspect individual key histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and a cloud service.

- **Key Aging Report:** Track keys by their expiration dates. Audit a range of dates, from past material deletions to future scheduled deletions, within a cloud service.
- **Service/Usage Report:** Monitor key usage by tracking services and applications consuming the keys. View when and where a service requests the use of each key.

Note

Reporting is not supported for the Azure Stack cloud. All clouds do not support all types of reports. Refer to related sections of the CCKM documentation for cloud-specific reports.

User Roles

CCKM has the following users with different responsibilities in administering and using the resources of supported clouds and key sources.

CCKM Admins

There is a System Defined Group named "CCKM Admins". Users within the "CCKM Admins" group are CCKM Administrators. Additionally, the CCKM administrators need the Key Users, Connection Admins, and User Admins permissions to perform key operations on the supported clouds.

A CCKM Administrator is responsible for creating and managing the following resources:

- AWS KMS Accounts, AWS Keys, AWS Custom Key Stores
- Azure Key Vaults, Azure Subscriptions, and Azure Keys
- Luna HSM Partitions, Luna Keys
- DSM Domains, DSM Keys
- Google Cloud Projects, Key Rings, and Keys
- Google EKM endpoints
- Microsoft DKE endpoints
- Salesforce Organizations, Tenant Secrets
- SAP Groups, SAP Keys
- CCKM Schedules
- CCKM Reports

CCKM Users

There is a System Defined Group named "CCKM Users". CCKM users registered with the CipherTrust Manager are part of this group. Additionally, the CCKM users need the Key Users permissions to perform key operations on the supported clouds. As well, they need custom key store permissions to manage AWS custom key stores.

Additional ACLs/Permissions

Additional ACLs/permissions can be granted to different CCKM roles on individual cloud resources such as [AWS Accounts](#), [Azure Key Vaults](#), [DSM Domains](#), [Google Key Rings](#), [Luna HSM Partitions](#), [Oracle Vaults](#), [Salesforce Organizations](#), and [SAP Groups](#).

Refer to the [CCKM documentation](#) of the respective clouds.

Support for Changing the Default Port of Web Interface Setting

The web interface port within CipherTrust Manager can be changed from the default port of **443** to another port. The web interface is used to serve both the GUI and the REST API in CCKM. Changing the web interface port does not affect the BYOK use cases in CCKM. However, it does affect the following cloud services:

- AWS XKS
- Google EKM
- Google Workspace CSE
- Microsoft DKE
- OCI EKMS (HYOK)
- SFDC Cache-only Key

If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it **before** configuring these cloud services on CCKM.

Note

Changing the default port **after** configuring these cloud services is not supported.

To change the web interface port when configuring a CSE, DKE, Google EKM, or SFDC Cache-only endpoint, specify the new port number along with the hostname when adding the hostname. For example, `example.com:8443`.

In the case of AWS XKS and Google Cryptospace, AWS KMS and Google only accept and send requests on the default port of 443. If you wish to use a different port for the web interface other than the default, add a network component, such as a load balancer or a firewall, in front of CipherTrust Manager. Then configure port mapping on this component by mapping port 443 to the non-default port on the CipherTrust Manager you plan to use.

For more information about the CipherTrust Manager web interface, refer to [Interfaces](#).

Proxy Configuration

If you plan to run the CipherTrust Manager appliance behind a proxy, you must configure the proxy, as described in [Proxy Configuration](#). For example, you might need to add the proxy CA certificate to the trusted certificates list for the CCKM traffic that passes through a proxy and terminates TLS connection.

Note

- For CCKM, configure an HTTPS proxy.
- Upgrading the CipherTrust Manager to 2.22 will not disrupt any proxy connections added via root access in the earlier releases. However, to update the CA, use the new UI and APIs introduced in CipherTrust Manager 2.22. See [Trusted CAs in CipherTrust Manager](#) for more information.

For the list of URLs to be whitelisted, refer to [URLs to Whitelist for Running CipherTrust Manager Behind Proxy](#).

Now, you should be able to connect CCKM with the cloud through the proxy.

URLs to Whitelist for Running CipherTrust Manager Behind Proxy

The following URLs must be whitelisted before you run the CipherTrust Manager behind a proxy.

Amazon Web Services

Service	URL	Purpose
CloudWatchLogs	logs.<region-name>.amazonaws.com	Fetch AWS reports.
EC2	ec2.amazonaws.com	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
EC2	ec2.us-east-1.amazonaws.com	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
EC2	ec2.<region-name>.amazonaws.com	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
IAM	iam.amazonaws.com	Manage access to AWS services and resources securely.
KMS	kms.<region-name>.amazonaws.com	Communicate with AWS KMS for key management.
STS	sts.amazonaws.com	Authenticate AWS users.
STS	sts.us-east-1.amazonaws.com	Authenticate AWS users.
STS	sts.<region-name>.amazonaws.com	Authenticate AWS users.

Service	URL	Purpose
AWS	aws.amazon.com	Redirects to service URLs.

AWS GovCloud

Service	URL	Purpose
CloudWatchLogs	logs.<region-name>.amazonaws.com	Fetch AWS reports.
EC2	ec2.amazonaws.com	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
EC2	ec2.us-gov-east-1.amazonaws.com	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
EC2	ec2.<region-name>.amazonaws.com	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
IAM	iam.amazonaws.com	Manage access to AWS services and resources securely.
KMS	kms.<region-name>.amazonaws.com	Communicate with AWS KMS for key management.
STS	sts.us-gov-east-1.amazonaws.com	Authenticate AWS users.
STS	sts.<region-name>.amazonaws.com	Authenticate AWS users.

AWS China Cloud

Service	URL	Purpose
CloudWatchLogs	logs.<region-name>.amazonaws.com.cn	Fetch AWS reports.
EC2	ec2.amazonaws.com.cn	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
EC2	ec2.cn-north-1.amazonaws.com.cn	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
EC2	ec2.<region-name>.amazonaws.com.cn	Required to fetch AWS regions. After all the regions are fetched, the service is no longer needed.
IAM	iam.amazonaws.com	Manage access to AWS services and resources securely.
KMS	kms.<region-name>.amazonaws.com.cn	Communicate with AWS KMS for key management.

Service	URL	Purpose
STS	sts.cn-north-1.amazonaws.com.cn	Authenticate AWS users.
STS	sts.<region-name>.amazonaws.com.cn	Authenticate AWS users.

Azure Public Cloud

URL	Purpose
management.azure.com	Fetch subscriptions and key vaults
login.microsoftonline.com	Authenticate Azure credentials
graph.windows.net	For Azure Stack
vault.azure.net	Manage keys
*.vault.azure.net	Manage keys
api.loganalytics.io	Fetch Azure reports
managedhsm.azure.net	Manage keys
*.managedhsm.azure.net	Manage keys

Azure Public Cloud (for Microsoft DKE)

URL	Purpose
login.microsoftonline.com	Authenticate Azure credentials
graph.microsoft.com	Fetch users and user roles

Azure US Gov Cloud

URL	Purpose
management.core.usgovcloudapi.net	Fetch subscriptions and key vaults
management.usgovcloudapi.net	Fetch subscriptions and key vaults
login.microsoftonline.us	Authenticate Azure credentials
vault.usgovcloudapi.net	Manage keys
*.vault.usgovcloudapi.net	Manage keys
graph.windows.net	For Azure Stack
api.loganalytics.us	Fetch Azure reports

Azure China Cloud

URL	Purpose
management.core.chinacloudapi.cn	Fetch subscriptions and key vaults
management.chinacloudapi.cn	Fetch subscriptions and key vaults
login.chinacloudapi.cn	Authenticate Azure credentials
vault.azure.cn	Manage keys
*.vault.azure.cn	Manage keys
graph.chinacloudapi.cn	For Azure Stack

Google Cloud CMEK

URL	Purpose
https://oauth2.googleapis.com	Authenticate Google cloud service accounts
https://cloudresourcemanager.googleapis.com	Fetch Google cloud projects
https://cloudkms.googleapis.com	Manage Google cloud keys, and fetch Google cloud locations and key rings
https://logging.googleapis.com	Fetch Google cloud reports

Google Cloud EKM

URL	Purpose
https://www.googleapis.com/	Verify and validate authentication and authorization JWTs
https://compute.googleapis.com	Creates and runs virtual machines on Google Cloud platforms. Required for EKM Ubiquitous Data Encryption (UDE) upstream verification.

Google Workspace CSE

URL	Purpose
https://www.googleapis.com/	Verify and validate authorization JWTs
https://admin.google.com	• Configure endpoint URLs and Identity Provider (IdP) settings on the Google Admin Console • Cross-Origin Resource Sharing (CORS) URL to allow requests from the Origin URL
https://krahsc.google.com	CORS URL to allow requests from the Origin URL
https://docs.google.com	Encrypt and decrypt Google Docs
https://drive.google.com	Encrypt and decrypt Google Drive

URL	Purpose
https://meet.google.com	Encrypt and decrypt Google Meet calls
https://calendar.google.com	Encrypt and decrypt Google Calendar events
https://mail.google.com	Encrypt and decrypt Gmail messages
https://client-side-encryption.google.com	CORS URL to allow requests from the Origin URL
Identity Provider URL	Verify and validate the authentication JWTs

The following redirect callback URIs need to be configured on the *IdP application* (for example, `auth0`) for authentication.

- https://client-side-encryption.google.com/callback
- https://client-side-encryption.google.com/oidc/cse/callback
- https://client-side-encryption.google.com/oidc/drive/callback
- https://client-side-encryption.google.com/oidc/gmail/callback
- https://client-side-encryption.google.com/oidc/meet/callback
- https://client-side-encryption.google.com/oidc/calendar/callback
- https://client-side-encryption.google.com/oidc/docs/callback
- https://client-side-encryption.google.com/oidc/sheets/callback
- https://client-side-encryption.google.com/oidc/slides/callback

Oracle Cloud

Service	URL	Purpose
Audit	audit.<region>.oraclecloud.com	Fetch OCI audit logs that will be used for OCI report generation.
Identity	identity.<region>.oci.oraclecloud.com	Required to test connection and fetch Oracle compartments and other related resources.
Identity Domain	<identity domain URL>	Required to verify and validate the authorization JWT.
Vault (KMS)	kms.<region>.oraclecloud.com	Communicate with OCI vaults for key management.
Object Storage	objectstorage.<region>.oraclecloud.com	Communicate with OCI buckets for key backup/restore.

Salesforce Cloud

URL	Purpose
login.salesforce.com	Authenticate Salesforce user credentials
test.salesforce.com	Verify SFDC Sandbox users (used to test connection with the Salesforce Sandbox)
<YourInstance>.salesforce.com	Manage keys
<salesforce hostname URL>	Authentication and managing keys

SAP Data Custodian

Service	URL	Purpose
KMS	<instance-subdomain>.datacustodian.cloud.sap	Communicate with SAP KMS for authorization, audit, cryptography, keys, groups, and backups.

Connecting CCKM in Amazon Virtual Private Cloud (VPC)

When AWS KMS is in Amazon VPC:

- IAM is not supported, as it is a global AWS service. Therefore, CCKM users cannot fetch IAM roles and users.
- CCKM cannot connect with the EC2, KMS, Logs, and STS services using public IP addresses. If their endpoints are not added on AWS, you cannot add AWS connections and AWS keys on the CipherTrust Manager. For successful connection, add the IP addresses of VPC endpoints for these services for your AWS regions to the DNS hosts on the CipherTrust Manager.

For example, you need to add the IP addresses of VPC endpoints of `sts.amazonaws.com`, `ec2.us-east-1.amazonaws.com`, `logs.us-east-1.amazonaws.com`, and `kms.us-east-1.amazonaws.com` service URLs to the DNS hosts list.

To add the IP address of a VPC endpoint:

On AWS Console

1. Create the VPC endpoint for a service.
2. Copy the DNS name of the service.
3. Ping the DNS name to find out the associated IP address.
4. Copy the IP address.

On CipherTrust Manager

1. Log on to the **CipherTrust Manager** GUI.

2. In the left pane, click **Admin Settings > DNS Hosts**.
3. Click **Add DNS Host**.
4. In the **Hostname** field, enter the service URL, for example, `sts.amazonaws.com`.
5. In the **IP Address** field, paste the copied IP address.
6. Click **Save**.

Similarly, add the DNS host entries for all three services, for all your AWS regions.

AWS Resources

This section describes prerequisites to manage AWS resources on the CCKM.

Prerequisites

- Before you can add an AWS account to the CCKM, an AWS connection must already exist on the CipherTrust Manager. A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connection Manager](#) for details.
- Appropriate permissions to manage the AWS KMS must be added on the **AWS console**.
 - a. **Permissions to list regions:** Add the IAM permission `ec2:DescribeRegions` to list the AWS regions. For example:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": "ec2:DescribeRegions",
      "Resource": "*"
    }
  ]
}
```

- b. **Permissions to manage AWS resources:** Add the following IAM permissions to manage AWS resources:
 - `kms:ListAliases`
 - `kms:ListKeyPolicies`
 - `kms:ListKeys`

-
- kms:ListResourceTags
 - kms:DescribeKey
 - kms:GetKeyPolicy
 - kms:GetKeyRotationStatus
 - kms:GetParametersForImport
 - kms:GetPublicKey
 - kms:TagResource
 - kms:UntagResource
 - kms:CancelKeyDeletion
 - kms:CreateAlias
 - kms:CreateKey
 - kms>DeleteAlias
 - kms:DeleteImportedKeyMaterial
 - kms:DisableKey
 - kms:DisableKeyRotation
 - kms:DescribeCustomKeyStores
 - kms:EnableKey
 - kms:EnableKeyRotation
 - kms:ImportKeyMaterial
 - kms:ListKeyRotations
 - kms:RotateKeyOnDemand
 - kms:ScheduleKeyDeletion
 - kms:UpdateAlias
 - kms:UpdateKeyDescription
 - kms:PutKeyPolicy
 - iam:ListGroups
-

- iam:ListRoles
- iam:ListUsers
- logs:DescribeLogGroups
- logs:FilterLogEvents

For example:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:DisableKey",
        "kms:ListAliases",
        "kms:ListKeyPolicies",
        "kms:ListKeys",
        "kms:ListResourceTags",
        "kms:DescribeKey",
        "kms:GetKeyPolicy",
        "kms:GetKeyRotationStatus",
        "kms:GetParametersForImport",
        "kms:GetPublicKey",
        "kms:TagResource",
        "kms:UntagResource",
        "kms:CancelKeyDeletion",
        "kms:CreateAlias",
        "kms:CreateKey",
        "kms>DeleteAlias",
        "kms>DeleteImportedKeyMaterial",
        "kms:DescribeCustomKeyStores",
        "kms:DisableKeyRotation",
        "kms:EnableKey",
        "kms:EnableKeyRotation",
        "kms:ImportKeyMaterial",
        "kms:ScheduleKeyDeletion",
        "kms:UpdateAlias",
        "kms:UpdateKeyDescription",
        "kms:PutKeyPolicy",
        "iam:ListGroups",
        "iam:ListRoles",
        "iam:ListUsers",
```

```

        "logs:DescribeLogGroups",
        "logs:FilterLogEvents"
    ],
    "Resource": "*"
}
]
}

```

Note

- To manage a multi-region key, an additional IAM permission `iam:CreateServiceLinkedRole` is required.
- To manage the External Custom Key Stores or CloudHSM Key Stores, additional IAM permissions required to use AWS resources are:
 - `cloudhsm:DescribeClusters`
 - `kms:CreateCustomKeyStore`
 - `kms:ConnectCustomKeyStore`
 - `kms>DeleteCustomKeyStore`
 - `kms:DisconnectCustomKeyStore`
 - `kms:UpdateCustomKeyStore`
 - `iam:CreateServiceLinkedRole`
- Permissions might take some time to be effective on AWS. Until then, a permission error might occur. Wait for some time and retry.

Now, [AWS accounts](#) and [AWS keys](#) can be managed on the CipherTrust Manager.

Note

- To use AWS IAM Roles Anywhere with CCKM, [additional configuration](#) is required.
- Grant permissions to the IAM user management account to use the Automatic Cloud Key Discovery schedule. Refer to the below section for details.
- AWS GovCloud does not support AWS IAM Roles Anywhere.

Additional Configuration for AWS IAM Roles Anywhere

The AWS IAM Roles Anywhere service allows non-federated identities outside AWS to assume IAM roles and use their permissions to access resources. The service provides a secure way for the workloads that run outside of AWS such as servers, containers, and applications to use X.509 digital certificates to obtain temporary AWS credential. This eliminates the need to manage long-term credentials for external workloads.

To use IAM Roles Anywhere, external workloads must use X.509 certificates issued by a Certificate Authority (CA). The CA needs to be registered as a trust anchor with the IAM Roles Anywhere service to establish trust between them. Alternatively, AWS Private Certificate Authority (AWS Private CA) can be used to create a CA and then use that to establish trust with IAM Roles Anywhere.

CA and Client Certificate Requirements

- Client certificates must satisfy the following requirements for authentication:
 - The certificates must be X.509v3
 - Basic constraints must include `CA: false`
 - The key usage must include Digital Signature
 - The signing algorithm must include SHA256 or a stronger algorithm (MD5 and SHA1 signing algorithms are rejected)
- Certificates used as trust anchors must satisfy the following requirements for signature algorithm:
 - The certificates must be X.509v3
 - Basic constraints **MUST** include `CA: true`
 - The key usage must include Certificate Sign, and may include CRL Sign
 - The signing algorithm must include SHA256 or a stronger algorithm (MD5 and SHA1 signing algorithms are rejected)
 - Certificate Revocation Lists (CRLs) are an optional feature of IAM Roles Anywhere

Configuration Steps

To use IAM Roles Anywhere for authentication to AWS from external workloads:

1. **Create a trust anchor.** This anchor is essentially a reference to a CA that IAM Roles Anywhere service will use to validate the authentication requests. Both the root and intermediate CAs can be used as trust anchors.
2. **Create an IAM role** that trusts the IAM Roles Anywhere service principal.
3. **Create a profile** that lists the roles IAM Roles Anywhere assumes. In the profile, you can limit the permissions for a created session with IAM managed policies.

By adding one or more roles to a profile and enabling IAM Roles Anywhere to assume these roles, a non-

AWS workload can use the client certificate issued by the trusted CA to make secure requests to AWS and get temporary credentials to access the AWS environment.

Note

- When the CipherTrust Manager is in AWS VPC, the trust anchor, and profile must be created in the same region from where the CipherTrust Manager instance is launched.
- Refer to the [AWS IAM Roles Anywhere](#) documentation for detailed instructions.

4. **Add an AWS connection** on the CipherTrust Manager with *IAM Roles Anywhere* enabled. While adding the connection for IAM Roles Anywhere, you need to specify:

- The AWS Resource Names (ARNs) of the trust anchor, IAM role, and profile created in the above steps
- Client's private key and certificate

Refer to [Connection Manager](#) for details.

Note

To migrate an AWS connection from using access keys and secrets to one that uses IAM roles, refer to [Migrating to IAM Roles Anywhere Connections](#).

Configurations to Discover all AWS accounts

To allow CCKM to discover all AWS accounts within an AWS Organization.

1. Create an IAM user in the management account.
2. Grant the IAM user the following permissions to manage KMS keys in member accounts through CCKM, as defined in the sample policy below:
 - List all organizational units (OUs) and accounts within the organization.
 - Assume a role in each member account.

Sample policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AutoDiscoveryOrgPermissions",
```

```

        "Effect": "Allow",
        "Action": [
            "organizations:DescribeOrganization",
            "organizations:ListAccounts",
            "organizations:ListChildren",
            "organizations:ListParents",
            "organizations:ListAccountsForParent",
            "organizations:ListOrganizationalUnitsForParent"
        ],
        "Resource": "*"
    },
    {
        "Sid": "AutoDiscoveryAssumeRolePermissions",
        "Effect": "Allow",
        "Action": [
            "sts:AssumeRole"
        ],
        "Resource": "arn:aws:iam::*:role/<Member Accounts role name e.g. AutoDiscoveryRole>"
    }
]
}

```

3. Create a trust relationship between the role in the member account and the user in the management account. Then, assign the necessary permissions as defined in the sample policy below.

Sample policy:

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::<Management Account ID>:user/<Management Account IAM user name>"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}

```

4. Create an **AWS CloudFormation StackSet** (or simply **StackSet**) to automatically add a role to the member

accounts. Refer to [Create StackSet \(self-managed permissions\)](#) for details.

When creating a StackSet, select **Service-managed permissions**, update the management account ID, username, and member accounts' role name in the sample CloudFormation template provided below, and then upload the updated template.

Activate automatic deployment to allow StackSets to automatically create or delete CloudFormation stacks when a new AWS account joins or leaves the organization.

To use StackSets in AWS Organizations, the master account must enable data sharing between CloudFormation and Organizations. This can be done from the StackSets console. Once enabled, you can deploy stacks to all accounts in the organization or to specific organizational units (OUs). For more details, refer to [Activate Trusted Access with AWS Organizations](#).

Sample CloudFormation template:

```
{
  "Description": "Create IAM roles and policies to grant access to KMS",
  "Parameters": {
    "AwsAccountId": {
      "Type": "Number",
      "Default": "<Management Account ID>"
    },
    "AwsUserName": {
      "Type": "String",
      "Default": "<Management Account user name>"
    }
  },
  "Resources": {
    "AutoDiscoveryRole": {
      "Type": "AWS::IAM::Role",
      "Properties": {
        "RoleName": "AutoDiscoveryRole",
        "AssumeRolePolicyDocument": {
          "Version": "2012-10-17",
          "Statement": [
            {
              "Effect": "Allow",
              "Principal": {
                "AWS": {
                  "Fn::Sub": "arn:aws:iam::${AwsAccountId}:u
ser/${AwsUserName}"
                }
              }
            }
          ]
        },
        "Action": "sts:AssumeRole"
      }
    }
  }
}
```

```

    }
  ]
}
},
"AutoDiscoveryKMSPolicy": {
  "Type": "AWS::IAM::Policy",
  "Properties": {
    "PolicyName": "AutoDiscoveryKMSPolicy",
    "PolicyDocument": {
      "Version": "2012-10-17",
      "Statement": [
        {
          "Effect": "Allow",
          "Action": [
            "ec2:DescribeRegions",
            "kms:DisableKey",
            "kms:ListAliases",
            "kms:ListKeyPolicies",
            "kms:ListKeys",
            "kms:ListResourceTags",
            "kms:DescribeKey",
            "kms:GetKeyPolicy",
            "kms:GetKeyRotationStatus",
            "kms:GetParametersForImport",
            "kms:GetPublicKey",
            "kms:TagResource",
            "kms:UntagResource",
            "kms:CancelKeyDeletion",
            "kms:CreateAlias",
            "kms:CreateKey",
            "kms>DeleteAlias",
            "kms>DeleteImportedKeyMaterial",
            "kms:DescribeCustomKeyStores",
            "kms:DisableKeyRotation",
            "kms:EnableKey",
            "kms:EnableKeyRotation",
            "kms:ImportKeyMaterial",
            "kms:ScheduleKeyDeletion",
            "kms:UpdateAlias",
            "kms:UpdateKeyDescription",
            "kms:PutKeyPolicy",
            "iam:ListGroups",
            "iam:ListRoles",

```

```

        "iam:ListUsers",
        "logs:DescribeLogGroups",
        "logs:FilterLogEvents"
    ],
    "Resource": "*"
}

],
},
"Roles": [
    {
        "Ref": "AutoDiscoveryRole"
    }
]
}
},
"Outputs": {
    "RoleId": {
        "Description": "The ID of the IAM role",
        "Value": {
            "Ref": "AutoDiscoveryRole"
        }
    },
    "RoleArn": {
        "Description": "The ARN of the IAM role",
        "Value": {
            "Fn::GetAtt": [
                "AutoDiscoveryRole",
                "Arn"
            ]
        }
    },
    "KmsPolicyId": {
        "Description": "The ID of the IAM policy for AWS KMS",
        "Value": {
            "Ref": "AutoDiscoveryKMSPolicy"
        }
    }
}
}
}

```

After all of the above mentioned configurations are done, you need to add an AWS connection in CCKM using the management account IAM user credentials.

Refer to [Connection Manager](#) for details.

Managing AWS Accounts

This section describes how to manage AWS accounts on the CCKM.

Before proceeding, make sure to fulfill [prerequisites](#).

Adding AWS Accounts

CCKM allows adding same AWS account in one CipherTrust Manager domain with different names, with each entry having a unique set of regions. By default, only the KMSs linked with the AWS account that is used for connection with the CipherTrust Manager can be added. However, if you want, you can assume a role within the same or a different account, while adding KMS over the same connection.

To add an AWS account to the CCKM:

1. Log on to the **CipherTrust Manager** GUI as administrator.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
4. Click **Add Account**. The Add AWS Account screen is displayed.
5. Select/enter the following details:
 - a. Specify a unique **Name**.
 - b. From the **AWS Connection** drop-down list, select the desired connection.

The **AWS Account ID** and **Available regions** of the selected AWS connection are displayed.

- c. In the **Available regions** section, select the desired regions.

By default, all the regions are selected. You can also use the **Search** box to filter the regions.

If you select a subset of available regions, then the remaining regions can be added under a different AWS KMS account name but under the same AWS Account ID.

- d. Click the right arrow button (). The selected regions move to the **Selected regions** list.

6. Click **Save**. The AWS account is added to the CCKM.

Adding AWS KMS Account and Regions by AssumeRole

CCKM allows adding same AWS account in one CipherTrust Manager domain with different names, with each entry having a unique set of regions. By default, only the KMSs linked with the AWS account that is used for connection with the CipherTrust Manager can be added. However, if you want, you can assume a role within the same or a different account, while adding KMS over the same connection. To do this, you need to specify the ARN and/or external ID of the role to be assumed.

Note

An AssumeRole provides a set of temporary security credentials that you can use to access AWS resources that you might not normally have access to. Refer to [AWS documentation](#) for details on AWS AssumeRole.

Tip

To configure AWS accounts for AssumeRole, refer to [IAM tutorial: Delegate access across AWS accounts using IAM roles](#).

To add an AWS account and regions by AssumeRole:

1. Log on to the **CipherTrust Manager** GUI as administrator.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
4. Click **Add Account**. The Add AWS Account screen is displayed.
5. Select/enter the following details:
 - a. Specify a unique **Name**.
 - b. From the **AWS Connection** drop-down list, select the desired connection.

The **AWS Account ID** and **Available regions** of the selected AWS connection are displayed.

- c. Specify the AssumeRole details:
 - a. Select **Add Assumed Role**. The following fields are displayed:
 - **Assume Role**: Specify the Amazon Resource Name (ARN) of the role to be assumed. This is a mandatory field.
 - **Assume Role External ID**: Specify the external ID for the role to be assumed.
 - b. Click **Test Connection**. When the connection is successful, the **AWS Account ID** associated with the assumed role is displayed. The **Available regions** section is populated with the available regions.
 - d. In the **Available regions** section, select the desired regions.

By default, all the regions are selected. You can also use the **Search** box to filter the regions.

If you select a subset of available regions, then the remaining regions can be added under a different AWS

KMS account name but under the same AWS Account ID.

e. Click the right arrow button (). The selected regions move to the **Selected regions** list.

6. Click **Save**. The AWS account is added to the CCKM.

Refreshing AWS Accounts

Note

With support for on-demand rotation of both native and imported BYOK keys, the refresh operation now takes longer than in previous releases. This is because detailed rotation information must be synchronized from AWS KMS to CCKM.

Refreshing is the process to download keys and key stores created on the AWS KMS to the CCKM. You can refresh keys and key stores from individual or all KMS accounts.

- [Refreshing Specific AWS Accounts](#)
- [Refreshing All AWS Accounts](#)

Refreshing Specific AWS Accounts

To refresh an AWS account:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed. This page displays the list of AWS accounts.
3. Click the overflow icon () corresponding to the desired AWS account and click **Refresh Now**.
4. On the Refresh Now screen, select the desired account regions to be refreshed.
5. Click **Refresh**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > AWS > AWS Keys** page. Refer to [Viewing AWS Keys](#) for details.

Refreshed [CloudHSM key stores](#) and [external custom key stores](#) appear in the account details.

Refreshing All AWS Accounts

To refresh all AWS accounts:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed. This page displays the list of AWS accounts.
3. Click **Refresh All**.

Note

Refresh all KMS Accounts is a time intensive operation that could take several hours or days to complete. It will continue running in the background. Do you want to continue?

4. Click **Refresh All**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > AWS > AWS Keys** page. Refer to [Viewing AWS Keys](#) for details.

Refreshed [CloudHSM key stores](#) and [external custom key stores](#) appear in the account details of individual accounts.

Viewing/Editing Details of AWS Accounts

The AWS KMS Accounts page shows the list of existing AWS KMS accounts. Search for the KMS accounts by KMS Name or KMS Account ID.

Viewing AWS Account Details

To view the details of an AWS account:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page displays the following details:

Column	Description
Name	Name of the AWS account.
Last Refreshed	When the AWS account was last refreshed. Never is displayed for accounts that are never refreshed.
Account ID	ID of the AWS account. If the role of another AWS user is assumed, then the associated account ID is displayed.
Connection	Name of the connection.
Cloud	Cloud name.

Column	Description
Regions	Regions in which the account is added. If the role of another AWS user is assumed, then regions associated with the account ID are displayed.
Date Added to CCKM	Date when the AWS KMS account was added to the CCKM.

The **Assume Role ARN** column is hidden by default. This column specifies Amazon Resource Name (ARN) of the assumed role. To show/hide a column, click the custom view icon () , select/clear the desired column, and click **OK**.

Editing AWS Accounts Details

To edit the details of an AWS account:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed. This page displays the list of added AWS accounts.
3. Click the overflow icon () corresponding to the desired AWS account and click **View/Edit Details**. The mini detail view shows the details of the AWS KMS account, such as account ID, connection, Assume Role ARN with its external ID, and associated regions etc.

On this page, you can perform the following:

- Manage user permissions on the AWS account: Refer to [Managing User Permissions on AWS Accounts](#) for details.
- Modify connection and regions: Refer to [Modifying Connection and Regions](#) for details.
- Add or remove assume role: Refer to [Adding or Removing Assume Role](#) for details.

Archiving AWS Accounts

You can archive an AWS account to switch it to read-only mode and to prevent it from using an active license.

You can recover and delete the archived AMS account using the **Recover** and **Delete** options, respectively. For more information, see [Recovering AWS Accounts](#) and [Deleting AWS Accounts](#).

To archive an AWS account:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the overflow icon () corresponding to the desired AWS account, then select **Archive**. The **Archive AWS Account** message appears.

4. Select **I wish to archive this account**.
5. Click **Archive**.

After this step, the **Status** of the archived AWS account changes to **ARCHIVED**, and automatic operations such as synchronization, key rotation, XKS credential rotation no longer function for this account.

Recovering AWS Accounts

You can recover an archived AWS account to make it editable and to activate its licensed version.

To recover an archived AWS account:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the overflow icon () corresponding to the desired AWS account, then select **Recover**. The **Recover AWS Account** message is displayed.
4. Select **I wish to recover this account**.
5. Click **Recover**.

After this step, the **Status** of the recovered AWS account changes to **ACTIVE**.

Managing User Permissions on AWS Accounts

To work with AWS, users/groups must have the minimum set of permissions that allow them to use the AWS resources such as keys, AWS KMS, and reports. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform actions on the AWS account. Refer to [User Roles](#) for details.

To add permission for user/group:

1. In the **ACCESS CONTROL** section, click **Assign User/Group**.
2. On the **Assign User/Group** screen, select the user or group to be assigned permissions from the **User/Group** drop-down list.
3. Click **Save**.

The newly added user/group is displayed under **Name** in the **Access Control** section.

Note

Use the All Keys, BYOK Keys, Native Keys, HYOK Keys, Custom Key Store, and Reports tabs to specify permissions for the different key types, custom key store, and reports. These tabs display the operations allowed on the AWS accounts. The default tab All Keys shows permissions for all keys.

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. Under the **ACCESS CONTROL** section, click the desired tab.
2. Select the check box under the desired operation corresponding to the desired users or groups.

Note

On the BYOK Keys, HYOK keys, and Native Keys tab, the **View Key** permission is required for granting the **Add Key** permission. If you grant the **Add Key** permission, the **View Key** permission is automatically added, even if it not granted already.

Similarly on the Custom Key Store tab, the **View** permission is required for granting the **Add** permission. If you grant the **Add** permission, the **View** permission is automatically added, even if it is not granted already.

3. Click **Update**.

A success message is displayed on the screen.

Removing a Permission

To remove a permission assigned to a user or group:

1. Under the **ACCESS CONTROL** section, click the desired tab.
2. Clear the check box under the desired operation corresponding to the desired users or groups.
3. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. Under the **ACCESS CONTROL** section, click the desired tab.
2. Under **Remove**, click the **X** button corresponding to the desired user/group.
3. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group. Are you sure you want to continue?

4. Click **Remove**.

This step removes the explicitly added permissions and restores the default permission for the user.

Modifying Connection and Regions

You can update AWS connection and AssumeRole credentials as long as they point to the same AWS account.

To change the connection linked with the AWS account:

1. Under **GENERAL INFO**, from the **AWS Connection** drop-down list, select the desired connection.
2. Click **Update**.

To add regions to the AWS account:

1. Under **GENERAL INFO > Select Regions**, in the **All Available Regions** section, select the desired regions.
2. Click the right arrow button (). The selected regions move to the **All Selected Regions** list.
3. Click **Update**.

To remove regions from the AWS account:

1. Under **GENERAL INFO > Select Regions**, in the **All Selected Regions** section, select the regions to be removed.
2. Click the left arrow button (). The selected regions move to the **All Available Regions** list.
3. Click **Update**.

Adding or Removing Assume Role

You can update AWS connection and AssumeRole credentials as long as they point to the same AWS account.

To add an Assume Role:

1. Under **GENERAL INFO**, select **Add Assume Role**.
2. Select **Add Assumed Role**. The following fields are displayed:
 - **Assume Role**: Specify the Amazon Resource Name (ARN) of the role to be assumed. This is a mandatory field.
 - **Assume Role External ID**: Specify the external ID for the role to be assumed.
3. Click **Test Connection**. When the connection is successful, the **All Available Regions** section is populated with available regions.
4. Add or remove regions as appropriate.
5. Click **Update**.

To change an Assume Role:

1. Under **GENERAL INFO**, change the following details:
 - **Assume Role**: Specify the Amazon Resource Name (ARN) of the role to be assumed. This is a mandatory field.
 - **Assume Role External ID**: Specify the external ID for the role to be assumed.
2. Click **Test Connection**.
3. Add or remove regions as appropriate.
4. Click **Update**.

Deleting AWS Accounts

To delete an AWS KMS account:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed. This page displays the list of added AWS KMS accounts.
3. Click the overflow icon () corresponding to the desired AWS account and click **Delete**. The **Delete AWS Account** message is displayed.
4. Select **I wish to delete this account**.
5. Click **Delete Account**.

Note

After an AWS account is deleted from the CipherTrust Manager, the keys existing in the AWS KMS account (native and BYOK) are not affected. However, you can no longer manage those keys from CCKM. The AWS services using the AWS KMS keys continue to function without any issues.

Managing AWS Keys

This section describes how to manage AWS keys on CipherTrust Cloud Key Manager (CCKM). Before proceeding, you must have an AWS account added to the CCKM. Refer to [Managing AWS Accounts](#) for details.

Note

AWS-managed keys can't be managed by CCKM. Any key management operations on such keys from CCKM will not succeed.

Source Types

For adding AWS keys, CCKM supports the following key material sources:

- **Native:** Create AWS key material directly with native AWS application. Refer to [Creating Native Key Material](#) for details.
- **External (BYOK):** External (Bring Your Own Key). Add key material by creating or uploading new source key from an external source. Refer to [Adding Key Material Using External \(BYOK\) Source](#) for details. You can select CipherTrust Manager (External), CipherTrust Manager (Local), or Vormetric Data Security Manager (DSM) as an external key source, or Decide Later.
- **CloudHSM Key Store:** Create a CloudHSM key from CCKM using key material from AWS CloudHSM, which is the key source.
- **External Custom Key Store (HYOK):** External Custom Key Store (Hold Your Own Key). Add an HYOK key tied to key material stored in a Luna HSM or a CipherTrust Manager depending on which key source you are using. AWS Key Management Services (KMS) communicates to CCKM, which uses the AWS HYOK key as an intermediary to the source key stored in a Luna HSM or CipherTrust Manager. Depending on which key source you are using, Luna or CipherTrust Manager executes the cryptographic operations. You can rotate the HYOK key, which associates a new key in the Luna HSM or associates a new version to the CipherTrust Manager key.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

There are different operations available for HYOK keys than for other key types. You can perform the following HYOK key operations:

- Create an HYOK key
- Linking HYOK keys
- View HYOK key details
- Apply a Key Rotation Schedule
- Adding/Editing Policies
- Enable and disable
- Manually delete an Unlinked HYOK key
- Scheduling Key Deletion
- Manually rotate an HYOK Key
- Block or unblock an HYOK key

Regionality

When creating an AWS Native key or External (BYOK) key, you can specify whether the key is a single-region key or a multi-region key.

Note

This functionality is applicable to Native and BYOK keys.

- **Single-Region Key:** A single-region key cannot be replicated in other AWS regions.
- **Multi-Region Key:** A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

Creating Native Key Material

To create AWS key material directly with native AWS application:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**.
3. Click **Add Key**. The Key Material Origin screen of the Add AWS Key wizard is displayed.

Key Material Origin

1. Select the desired **AWS Account** from the drop-down list.
2. Select the desired **Region** from the drop-down list. The list shows the regions in which the selected AWS account is available.
3. Select **Native** as the **Origin Type**.
4. Select **Regionality**. The options are:
 - **Single-Region Key**: A single-region key cannot be replicated in other AWS regions.
 - **Multi-Region Key**: A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

5. Click **Next**. The Destination (AWS) Key screen is displayed.

Destination (AWS) Key

1. Under **Select Key Type**, select the desired key type. The options are:
 - **Symmetric**: One key does encryption and decryption.
 - **Asymmetric**: A key pair does encryption and decryption.

2. Under **Select Key Usage**, select the key usage:

- **Encrypt and Decrypt:**
 - For symmetric keys, the key is used only to encrypt and decrypt the data.
 - For asymmetric keys, the public key is used to encrypt while the private key is used to decrypt.
- (Symmetric keys only) **Generate and Verify MAC:** The key is used only to generate and verify hash-based message authentication codes (HMACs).
- (Asymmetric keys only) **Sign and Verify:** In this key pair, the public key is used to sign while the private key is used to verify.

3. Enter a user-friendly **Alias** for the key. This helps uniquely identify a key.

4. (Optional) Provide a brief **Description** of the key.

5. Select the desired **Key Algorithm** from the drop-down list.

Note

The **Algorithm** field is not displayed for symmetric keys when their Key Usage is selected as **Encrypt and Decrypt**.

6. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters **** _ . / = + - @ ****

- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

7. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy, select a saved policy, and build from template.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw

View.

- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template**.
3. (Optional) Make the necessary changes in the template.

4. Click **Next**.

Based on the selection of the key type and key usage, the Add to Schedule screen or AWS Automatic Key Rotation screen is displayed. Click the desired tab to view the instructions.

Add to Schedule

Note

If Asymmetric is selected as the Key Type when specifying the Destination Key details, the key cannot be scheduled.

1. From the **Rotation** drop-down list, select a schedule to apply.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. (Optional) For BYOK or Native keys, you can grant or deny the encrypt permission to the key policy in the AWS account where the key is created in OR to the key policy in *all accounts* the key is shared in:

- Select **Disable Encrypt Permissions on Current Key** to deny the encrypt permission to the key policy in the AWS account where the key is created in. Clear the check box to grant the encrypt permission. By default, **Disable Encrypt Permissions on Current Key** is selected, that is, the encrypt permission is denied to the current key.
- Select **Disable Encrypt Permissions on All Accounts** to deny the encrypt permission to the key policy in all the AWS accounts the key is shared in. Clear the check box to grant the encrypt permission.

3. Select the **Key Origin** from the available options. The key origin can be:

- **CipherTrust**: CipherTrust Manager.
- **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
- **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.

4. Click **Next**.

The Review and Add Key screen is displayed.

AWS Automatic Key Rotation

Note

Automatic key rotation only applies to the AWS native keys that have the algorithm as SYMMETRIC_DEFAULT.

Automatically rotate AWS native keys after a specified time period. To enable automatic key rotation:

1. Enable **automatic key rotation**
2. Enter the **Rotation period (in days)**.

Based on the entered rotation period, the next rotation date will be displayed. The default rotation period is 365 days.

3. Click **Next**.

The Review and Add Key screen is displayed.

Review And Add Key

This screen shows the key details that you have provided. These details are divided into KEY MATERIAL ORIGIN, KEY POLICY, NATIVE KEY, and KEY SCHEDULES (or AWS AUTOMATIC KEY ROTATION) sections. For a multi-region key, the NATIVE KEY section shows Multi-Region Key as the Regionality.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the MATERIAL ORIGIN, KEY POLICY, NATIVE KEY, and KEY SCHEDULES (or AWS AUTOMATIC KEY ROTATION) sections, and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the NATIVE KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **OK**. The Add AWS Key wizard is closed.

The newly created key is displayed in the list of AWS keys.

Adding Key Material Using External (BYOK) Source

To add key material using external BYOK as a key source:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**.
3. Click **Add Key**. The Key Material Origin screen of the Add AWS Key wizard is displayed.

Key Material Origin

1. Select the desired **AWS Account** from the drop-down list.
2. Select the desired **Region** from the drop-down list. The list shows the regions in which the selected AWS account is available.
3. Select **External (BYOK)** as **Origin Type**.
4. Select the **Source**. The options are:
 - **CipherTrust (External)**: Add key by creating or uploading an external CipherTrust key as the source key. Refer to [Adding Key Using External CipherTrust as External \(BYOK\) Source](#) for details.
 - **CipherTrust (Local)**: Add key by creating or uploading a CipherTrust key as the source key. Refer to [Adding Key Using Local CipherTrust as External \(BYOK\) Source](#) for details.
 - **Vormetric DSM**: Add key by creating or uploading a Vormetric DSM key as the source key. Refer to [Adding Key Using Vormetric DSM as External \(BYOK\) Source](#) for details.
 - **Luna HSM**: Add key by creating or uploading a Luna HSM key as the source key. Refer to [Adding Key Using Luna HSM as External \(BYOK\) Source](#) for details.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- **Decide Later**: Add key now, but decide the key source later. Refer to [Deciding Key Material Later](#) for details.

Adding Key Using External CipherTrust as External (BYOK) Source

To add a key by creating or uploading an external CipherTrust key as the source key:

Key Material Origin

1. Select **CipherTrust (External)** as the **Source**.
2. Select **Regionality**. The options are:

- **Single-Region Key:** A single-region key cannot be replicated in other AWS regions.
- **Multi-Region Key:** A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

3. Click **Next**. The Source Key screen is displayed.

Configure CipherTrust (External) Key

1. Select the **Source Key Material**. You can select Create New Key or Copy Existing Key.

Click the desired tab to view the instructions.

Create New Key

- Click **Create New Key**.
- Select Key Type.** The options are **Symmetric** and **Asymmetric**.
- Select a **Domain**.
- Enter the **Key Name**.
- Select **Algorithm**:
 - For **Symmetric** keys, the options are **AES** or **HMAC**.
 - For **Asymmetric** keys, the options are **RSA** or **EC**.
- Select the **Key Size / Key Curve** based on the algorithm:
 - For the **HMAC** algorithm, the options are 256, 384, and 512.
 - For the **RSA** algorithm, the options are 2048, 3072, and 4096.
 - For the **EC** algorithm, the options are secp384r1, secp521r1, and secp256k1.

Note

Not applicable to the **AES** algorithm.

Copy Existing Key

- a. Click **Copy Existing Key**.
- b. Select a **Domain**.
- c. Select **Algorithm**. The options are AES, HMAC, RSA, and EC.
- d. Select the **Key Size / Key Curve** based on the algorithm:
 - For the **HMAC** algorithm, the options are 256, 384, and 512.
 - For the **RSA** algorithm, the options are 2048, 3072, and 4096.
 - For the **EC** algorithm, the options are secp384r1, secp521r1, and secp256k1.

Note

Not applicable to the **AES** algorithm.

- e. (Optional) Enable **Fetch Latest Version Only**.
 - f. Select a **CipherTrust (External) Key** from the list.
2. Click **Next**. The Destination (AWS) Key screen is displayed.

Destination (AWS) Key

1. For RSA Keys, **Select Key Usage**. You can select **Encrypt and Decrypt** or **Sign and Verify**.
2. Enter a user-friendly **Alias** for the key. This helps uniquely identify a key.
3. (Optional) Provide a brief **Description** of the key.
4. (Optional) Set the key expiration date.
 - a. Select the **Set Expiration Date** check box.
 - b. Either enter the expiration time manually or select using the on-screen calendar. The time format is **MM/DD/YYYY HH:MM**, for example, September 16, 2020 1:50 PM.

To select a specific time, click **Time**, and select hours and minutes, from the GUI.

- c. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters `** _ . / = + - @ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

5. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw View.
- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template**.
3. (Optional) Make the necessary changes in the template.
4. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. From the **Rotation** drop-down list, select a schedule to apply.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Specify whether to **Disable Encrypt Permissions on Current Key**. By default, the encrypt permissions are disabled on the current key. Clear the check box to enable permissions.
3. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.

- **DSM:** Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.

4. Click **Next**.

The Review and Add Key screen is displayed.

Review And Add Key

This screen shows the key details that you have provided. These details are divided into KEY MATERIAL ORIGIN, KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections. For a multi-region key, the DESTINATION KEY section shows Multi-Region Key as the Regionality.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the KEY MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, KEY POLICY and KEY SCHEDULES sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **OK**. The Add AWS Key wizard is closed.

The newly created key is displayed in the list of AWS keys.

Adding Key Using Local CipherTrust as External (BYOK) Source

To add a key by creating or uploading a CipherTrust key as the source key:

Key Material Origin

1. Select **CipherTrust (Local)** as the **Source**.

2. Select **Regionality**. The options are:

- **Single-Region Key:** A single-region key cannot be replicated in other AWS regions.
- **Multi-Region Key:** A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

3. Click **Next**. The Configure CipherTrust (Local) Key screen is displayed.

Configure CipherTrust (Local) Key

1. Select the **Source Key Material**. You can select Create New Key or Copy Existing Key.

Click the desired tab to view the instructions.

Create New Key

- a. Click **Create New Key**.
- b. **Select Key Type**. The options are **Symmetric** and **Asymmetric**.
- c. Enter the **Key Name**.
- d. Select **Algorithm**:
 - For **Symmetric** keys, the options are **AES** or **HMAC**.
 - For **Asymmetric** keys, the options are **RSA** or **EC**.
- e. Select the **Key Size / Key Curve** based on the algorithm:
 - For the **HMAC** algorithm, the options are 256, 384, and 512.
 - For the **RSA** algorithm, the options are 2048, 3072, and 4096.
 - For the **EC** algorithm, the options are secp384r1, secp521r1, and secp256k1.

Note

Not applicable to the **AES** algorithm.

Copy Existing Key

- a. Click **Copy Existing Key**.
- b. Select **Algorithm**. The options are AES, HMAC, RSA, and EC.
- c. Select the **Key Size / Key Curve** based on the algorithm:

- For the **HMAC** algorithm, the options are 256, 384, and 512.
- For the **RSA** algorithm, the options are 2048, 3072, and 4096.
- For the **EC** algorithm, the options are secp384r1, secp521r1, and secp256k1.

Note

Not applicable to the **AES** algorithm.

- d. (Optional) Enable **Fetch Latest Version Only**.
 - e. Select a **CipherTrust (Local) Key** from the list.
2. Click **Next**. The Destination (AWS) Key screen is displayed.

Destination (AWS) Key

1. For RSA Keys, **Select Key Usage**. You can select **Encrypt and Decrypt** or **Sign and Verify**.
2. Enter a user-friendly **Alias** for the key. This helps uniquely identify a key.
3. (Optional) Provide a brief **Description** of the key.
4. (Optional) Set the key expiration date.
 - a. Select the **Set Expiration Date** check box.
 - b. Either enter the expiration time manually or select using the on-screen calendar. The time format is **MM/DD/YYYY HH:MM**, for example, September 16, 2020 1:50 PM.

To select a specific time, click **Time**, and select hours and minutes, from the GUI.
- c. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:
 - a. Specify a tag name.
 - b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters **** _ . / = + - @ ****

- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

5. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
-

-
2. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw View.
- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template.**
3. (Optional) Make the necessary changes in the template.
4. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. From the **Rotation** drop-down list, select a schedule to apply.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Specify whether to **Disable Encrypt Permissions on Current Key**. By default, the encrypt permissions are disabled on the current key. Clear the check box to enable permissions.
3. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust:** CipherTrust Manager.
 - **Luna:** HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM:** Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review And Add Key

This screen shows the key details that you have provided. These details are divided into KEY MATERIAL ORIGIN, KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections. For a multi-region key, the DESTINATION KEY section shows Multi-Region Key as the Regionality.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the KEY MATERIAL ORIGIN,

SOURCE KEY, DESTINATION KEY, KEY POLICY and KEY SCHEDULES sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **OK**. The Add AWS Key wizard is closed.

The newly created key is displayed in the list of AWS keys.

Adding Key Using Vormetric DSM as External (BYOK) Source

To add a key by creating or uploading a Vormetric DSM key as the source key:

Key Material Origin

1. Select **Vormetric DSM** as the **Source**.
2. Select **Regionality**. The options are:
 - **Single-Region Key**: A single-region key cannot be replicated in other AWS regions.
 - **Multi-Region Key**: A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

3. Click **Next**. The Source Key screen is displayed.

Source Key

1. Select the **Source Key Material**. You can select Create New Key or Copy Existing Key.

Click the desired tab to view the instructions.

Create New Key

- a. Click **Create New Key**.
 - b. Enter the **DSM Key Name**.
-

-
- c. Select a **DSM Domain**.

Note

Not applicable to the **AES** algorithm.

Copy Existing Key

- a. Click **Copy Existing Key**.

Note

The by default selected Algorithm and Key Size options are AES and 256, respectively.

- b. Select a **DSM Key** from the list.

- 2. Click **Next**. The Destination (AWS) Key screen is displayed.

Destination (AWS) Key

1. For RSA Keys, **Select Key Usage**. You can select **Encrypt and Decrypt** or **Sign and Verify**.
2. Enter a user-friendly **Alias** for the key. This helps uniquely identify a key.
3. (Optional) Provide a brief **Description** of the key.
4. (Optional) Set the key expiration date.
 - a. Select the **Set Expiration Date** check box.
 - b. Either enter the expiration time manually or select using the on-screen calendar. The time format is **MM/DD/YYYY HH:MM**, for example, September 16, 2020 1:50 PM.

To select a specific time, click **Time**, and select hours and minutes, from the GUI.
- c. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:
 - a. Specify a tag name.
 - b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters `** _ . / = + - @ **`

c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

5. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.

-
- Click **Next**.

Select Saved Policy

- Select the **Select Saved Policy** option.
- Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw View.
- Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- On the **Key Admins** tab, select the desired key admins.
- Click the **Key Users** tab.
- Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

d. Click **Apply**.

e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template**.
3. (Optional) Make the necessary changes in the template.
4. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. From the **Rotation** drop-down list, select a schedule to apply.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Specify whether to **Disable Encrypt Permissions on Current Key**. By default, the encrypt permissions are disabled on the current key. Clear the check box to enable permissions.
3. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review And Add Key

This screen shows the key details that you have provided. These details are divided into KEY MATERIAL ORIGIN, KEY POLICY, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections. For a multi-region key, the DESTINATION KEY section shows Multi-Region Key as the Regionality.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the KEY MATERIAL ORIGIN, KEY POLICY, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **OK**. The Add AWS Key wizard is closed.

The newly created key is displayed in the list of AWS keys.

Adding Key Using Luna HSM as External (BYOK) Source

To add a key by creating or uploading a Luna HSM key as the source key:

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Key Material Origin

1. Select **Luna HSM** as the **Source**.
2. Select **Regionality**. The options are:
 - **Single-Region Key**: A single-region key cannot be replicated in other AWS regions.
 - **Multi-Region Key**: A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

3. Click **Next**. The Source Key screen is displayed.

Source Key

1. Select the **Source Key Material**. This specifies how to create the key. The options are:

Create New Key

- a. Click **Create New Key**.
- b. **Select Key Type**. The options are **Symmetric** and **Asymmetric**.
- c. Enter the **Key Name**.
- d. Select a **Partition ID**.
- e. Select **Algorithm**:
 - For **Symmetric** keys, the option is **AES**.
 - For **Asymmetric** keys, the options are **RSA** or **EC**.
- f. (Applicable to RSA algorithm only) Select a Mechanism. The options are CKM_RSA_FIPS_186_3_AUX_PRIME_KEY_PAIR_GEN, CKM_RSA_X9_31_KEY_PAIR_GEN, CKM_RSA_FIPS_186_3_PRIME_KEY_PAIR_GEN, and CKM_RSA_PKCS_KEY_PAIR_GEN.

Note

The mechanisms for the AES algorithm and EC algorithm are CKM_AES_KEY_GEN and CKM_EC_KEY_PAIR_GEN, respectively.

- g. Select the **Key Size / Key Curve** based on the algorithm:
 - For the **RSA** algorithm, the options are 2048, 3072, and 4096.
 - For the **EC** algorithm, the options are secp384r1, secp521r1, and secp256k1.

Note

Not applicable to the **AES** algorithm.

Copy Existing Key

- a. Click **Copy Existing Key**.
- b. Select **Algorithm**. The options are AES, RSA, and EC.

-
- c. Select the **Key Size / Key Curve** based on the algorithm:
 - For the **AES** algorithm, the option is 256.
 - For the **RSA** algorithm, the options are 2048, 3072, and 4096.
 - For the **EC** algorithm, the options are secp384r1, secp521r1, and secp256k1.
 - d. Select a **HSM Key** from the list.

2. Click **Next**. The Destination (AWS) Key screen is displayed.

Destination (AWS) Key

1. For RSA keys, **Select Key Usage**. You can select **Encrypt and Decrypt** or **Sign and Verify**.
2. Enter a user-friendly **Alias** for the key. This helps uniquely identify a key.
3. (Optional) Provide a brief **Description** of the key.
4. (Optional) Set the key expiration date.
 - a. Select the **Set Expiration Date** check box.
 - b. Either enter the expiration time manually or select using the on-screen calendar. The time format is **MM/DD/YYYY HH:MM**, for example, September 16, 2020 1:50 PM.

To select a specific time, click **Time**, and select hours and minutes, from the GUI.
- c. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:
 - a. Specify a tag name.
 - b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters **** _ . / = + - @ ****

- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

5. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw

View.

- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template.**
3. (Optional) Make the necessary changes in the template.

4. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. From the **Rotation** drop-down list, select a schedule to apply.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Specify whether to **Disable Encrypt Permissions on Current Key**. By default, the encrypt permissions are disabled on the current key. Clear the check box to enable permissions.
3. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review And Add Key

This screen shows the key details that you have provided. These details are divided into KEY MATERIAL ORIGIN, KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections. For a multi-region key, the DESTINATION KEY section shows Multi-Region Key as the Regionality.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the KEY MATERIAL ORIGIN, KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections and update details.

Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the KEY POLICY, SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **OK**. The Add AWS Key wizard is closed.

The newly created key is displayed in the list of AWS keys.

Deciding Key Material Later

Add key now, but decide the key source later.

To add a new key without deciding the key material source:

Key Material Origin

1. Select **Decide Later** as the **Source**.
2. Select **Regionality**. The options are:
 - **Single-Region Key**: A single-region key cannot be replicated in other AWS regions.
 - **Multi-Region Key**: A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. However, any replica of the multi-region key can be set as the primary key later.

Note

After a key is created, its regionality cannot be changed.

3. Click **Next**. The Destination (AWS) Key screen is displayed.

Destination (AWS) Key

1. **Select Key Type**. The options are **Symmetric** and **Asymmetric**.
2. Under **Select Key Usage**, select the key usage:
 - **Encrypt and Decrypt**:
 - For symmetric keys, the key is used only to encrypt and decrypt the data.
 - For asymmetric keys, the public key is used to encrypt while the private key is used to decrypt.
 - (Symmetric keys only) **Generate and Verify MAC**: The key is used only to generate and verify hash-based message authentication codes (HMACs).
 - (Asymmetric keys only) **Sign and Verify**: In this key pair, the public key is used to sign while the private key is used to verify.

3. Enter a user-friendly **Alias** for the key. This helps uniquely identify a key.
4. (Optional) Provide a brief **Description** of the key.
5. Select the desired **Key Algorithm** from the drop-down list.

Note

The **Algorithm** field is not displayed for symmetric keys when their Key Usage is selected as **Encrypt and Decrypt**.

6. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters **** _ . / = + - @ ****

- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

7. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw View.
- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
 - b. Click the **Key Users** tab.
-

-
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template**.
3. (Optional) Make the necessary changes in the template.
4. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. From the **Rotation** drop-down list, select a schedule to apply.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs.

For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Specify whether to **Disable Encrypt Permissions on Current Key**. By default, the encrypt permissions are disabled on the current key. Clear the check box to enable permissions.
3. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review And Add Key

This screen shows the key details that you have provided. These details are divided into KEY MATERIAL ORIGIN, KEY POLICY, DESTINATION KEY and KEY SCHEDULES sections. For a multi-region key, the DESTINATION KEY section shows Multi-Region Key as the Regionality. The KEY MATERIAL ORIGIN section shows the Source Type as External (BYOK) and Source as Decide Later.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the KEY MATERIAL ORIGIN, KEY POLICY, DESTINATION KEY and KEY SCHEDULES sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **OK**. The Add AWS Key wizard is closed.

The newly created key is displayed in the list of AWS keys. The origin of the key is **BYOK - External** and the key state is **PendingImport**.

Creating CloudHSM Keys

Before you can create a CloudHSM key, you must ensure your CloudHSM key store is configured. For more information, see [AWS CloudHSM Key Store Resources](#).

To create a CloudHSM key using CloudHSM Source

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**.
3. Click **Add Key**. The Key Material Origin screen of the Add AWS Key wizard is displayed.

Key Material Origin

1. Select the desired **AWS Account** from the drop-down list.
2. Select the desired **Region** from the drop-down list.
3. Select **AWS CloudHSM Key Store** from **Origin Type**.
4. Select the desired **CloudHSM Key Store** from the drop-down list.
5. Enter a user-friendly **Alias** for the key. This helps uniquely identify the key.
6. (Optional) Provide a brief **Description** of the key.
7. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters **** _ . / = + - @ ****

- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

8. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

The Review And Add Key screen is displayed.

Select Existing Policy

1. Select the **Select Existing Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

To view the raw details of the selected policy, click **View Policy (Raw)**. To hide the raw details, click **Hide Policy (Raw)**.

3. Click **Next**.

The Review And Add Key screen is displayed.

Review And Add Key

1. Review the key details, and click **Add Key** to create.
2. Once creation completes, click **OK** to close the dialog.

Creating HYOK Keys

You must [prepare an external custom key store on CCKM](#) before you can create an HYOK key.

As part of creating an HYOK key, you create a new source key in either a Luna HSM partition or a CipherTrust Manager that is associated with the external custom key store. The source of the HYOK key must match the source of the [external custom key store](#).

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Configuration varies based on whether the HYOK is created in the [linked](#) or [unlinked](#) state.

If the HYOK key is created in the linked state, a KMS key is automatically created in the corresponding AWS KMS external key store.

If the HYOK key is created in the unlinked state, you must either [link it](#) to automatically create the corresponding KMS key on AWS KMS, or you must manually create the KMS key on AWS KMS. If you choose to manually create a KMS key, you can [refresh keys](#) to later detect and link the KMS key to its HYOK key on CCKM. Managing [AWS policies associated with the HYOK key on CCKM](#) is unsupported with unlinked keys.

Create a Linked HYOK Key

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**.
3. Click **Add Key**. The Key Material Origin screen of the Add AWS Key wizard is displayed.

Key Material Origin

1. Select the desired **AWS Account** from the drop-down list.
 2. Select **External Custom Key Store (HYOK)** from **Origin Type**.
 3. Select **CipherTrust (Local)** or **Luna HSM** from **Source**.
 4. Select **Linked Key** from the Linked State.
 5. Click **Next**. The Source Key screen is displayed.
-

Source Key

Caution

Modify AWS XKS (HYOK) only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not modify the source using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the XKS (HYOK) key unavailable to the AWS cloud service.

1. Select an **External Key Store** from the drop down.

Note

Only key stores hosted on the local CCKM, and matching the selected **Source** are available.

2. Select the **Source Key Material**. This specifies how to create the key.

- **Create New Key**

- a. Click to create a fresh key.
- b. Specify the **Source Key Name** for the source key. This will be the name for the new key.

Note

For Luna HSM keys, key attributes are displayed. These values are not editable.

- **Copy Existing Key**

- a. Click to create a new key by copying an existing source key.
- b. Select a **CipherTrust (Local) Key** from the list. For Luna HSM, the list shows the available keys based on the Luna HSM connection.

Valid source keys must have specific attributes, depending on the source type.

Source Type	Required Attributes
CipherTrust Manager	• Not exportable • Not deletable • Usage Masks: Encrypt, Decrypt, Wrap, Unwrap

Source Type	Required Attributes
Luna HSM	• CKA_EXTRACTABLE = FALSE • CKA_SENSITIVE = TRUE • CKA_ENCRYPT = TRUE • CKA_DECRYPT = TRUE • CKA_WRAP = TRUE • CKA_UNWRAP = TRUE

3. Click **Next**. The Destination (AWS key) screen is displayed.

Destination (AWS) Key

1. Add an **Alias** for the new KMS key.
2. Optionally add a **Description** and **Tags**, if desired.
3. Click **Next** The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy or select an existing policy.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON

format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Template Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw View.
- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template**.
3. (Optional) Make the necessary changes in the template.
4. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. Select the desired **Rotation** schedule to apply to the key from the drop-down list. This is an optional step.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Click **Next**. The Review And Add Key screen is displayed.

Review And Add Key

1. Review the key details, and click **Add Key** to create.

Creation completes and an **XKS ID** is generated for the new HYOK key.

2. Click **OK** to close the dialog.

Create an Unlinked HYOK key

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**.
3. Click **Add Key**. The Key Material Origin screen of the Add AWS Key wizard is displayed.

Key Material Origin

1. Select the desired **AWS Account** from the drop-down list.
2. Select **External Custom Key Store (HYOK)** from **Origin Type**.
3. Select **CipherTrust** or **Luna HSM** from **Source**.
4. Select **Unlinked Key** from the Linked State.

This means that the corresponding key is not automatically created in AWS KMS, and you must either link the HYOK after creation, or manually create the KMS key in AWS KMS.

5. Click **Next**. The Source Key screen is displayed.

Source Key

Caution

Modify AWS XKS (HYOK) only through the CipherTrust Cloud Key Management (CCKM) GUI, API, and CLI. Do not modify the source using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the XKS (HYOK) key unavailable to the AWS cloud service.

1. Select an **External Key Store** from the drop down.

Note

Only local key stores matching the selected **Source** are available.

2. Select the **Source Key Material**. This specifies how to create the key. The source key must be a symmetric AES-256 key.

For Luna source key stores, the `CKA_SENSITIVE`, `CKA_ENCRYPT`, `CKA_DECRYPT`, `CKA_WRAP`, and `CKA_UNWRAP` attributes must be enabled, and `CKA_EXTRACTABLE` must be disabled.

The options are:

- **Create New Key**

- a. Click to create a fresh key.
- b. Specify the **Source Key Name** for the source key. This will be the name for the new key.

Note

For Luna HSM keys, key attributes are displayed. These values are not editable.

- **Copy Existing Key**

- a. Click to create a new key by copying an existing source key.
- b. Select a **CipherTrust (Local) Key** from the list. For Luna HSM, the list shows the available keys based on the Luna HSM connection.

3. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. Select the desired **Rotation** schedule to apply to the key from the drop-down list. This is an optional step.

Note

If you're creating an imported AES symmetric key and the selected schedule has "Rotate Material (imported AES keys)" enabled, the key material will be rotated automatically when the schedule runs. For all other cases (including schedules without this option enabled), a new key will be created on rotation, and the alias will be reassigned to the new key.

2. Click **Next**. The Review And Add Key screen is displayed.

Review And Add Key

1. Review the key details, and click **Add Key** to create.

Creation completes and an **XKS ID** is generated for the new HYOK key.

2. Click **OK** to close the dialog.
3. Create the corresponding KMS key. You can either:
 - [Link the new HYOK key in CCKM](#).

- Manually create the key in AWS KMS:
 - a. In CCKM, retrieve the **XKS ID** value from the [key details page](#).
 - b. On AWS KMS, navigate to the external key store which corresponds to the CCKM external custom key store you selected for the HYOK key.
 - c. Create the KMS key. Provide the **XKS ID** for any fields indicating an **External key ID**.
 - d. Follow AWS documentation to associate the desired AWS services with the KMS key.
 - e. If you want to later link the KMS key to its associated HYOK key, [refresh all AWS keys](#).

Encryption and decryption requests will now be executed with the source key.

If the source key is a Luna HSM key, the cryptographic requests are executed inside the Luna HSM.

If the source key is a CipherTrust Manager key, the cryptographic requests are executed inside the CipherTrust Manager.

Linking HYOK Keys

If you created an HYOK key in an unlinked state, you can link it after creation. Linking an HYOK key automatically creates a new corresponding KMS key in AWS KMS.

Note

To link an existing KMS key, [refresh all the keys](#).

To link an HYOK key

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.

You can filter this list on **Origin: HYOK-CCKM** to display only local HYOK keys.

3. Click the overflow icon () corresponding to the desired key and click **Link**.

The Configure AWS Key screen of the Link AWS Key wizard is displayed.

4. Optionally provide an **Alias** and **Tags** for the new KMS key.
5. Click **Next**. The AWS Key Policy screen is displayed.
6. Click the desired tab to view the instructions.

Create New Policy

- a. Select the **Create New Policy** option.
- b. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

- c. Select **Save this Key Policy** and **Enter Template Name**.
- d. Click **Next**.

Select Saved Policy

- a. Select the **Select Saved Policy** option.
- b. Select a policy from the **Saved Policies** drop-down list.

You can also update the selected policy, and create a new policy using it.

- a. Select the policy view, you can select **Raw View** or **Basic View**. By default, the policy will open in the Raw View.
- b. Update the policy.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

- c. Click **Update**. The **Update Policy** message is displayed.

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter the **New Policy** name.

Note

If the selected policy is Unverified, the Update Policy message will not be displayed, a new policy will not be created.

- d. Click **Apply**.
- e. Click **Next**.

Build From Template

- a. Select the **Build From Template** option.
- b. **Select Template**.
- c. (Optional) Make the necessary changes in the template.
- d. Click **Next**.

The Review and Add screen is displayed.

7. Review the **AWS Key** and **AWS Key Policy** details.
-

8. Click **Link** to accept, link the HYOK key, and create a new KMS key.
9. Click **OK**.

Viewing AWS Keys

To view an AWS key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed. The AWS Keys page displays following details:

Field	Description
Alias	Unique, user-friendly alias of the key. This is useful in searching for specific keys. The AWS Keys page shows the latest alias under the Alias field. Additional aliases for the key are displayed in braces. For example, if a key has three aliases and the latest alias is "latest-alias", the Alias field shows "latest-alias (+2 more)". Clicking the link takes to the Aliases section of the key in edit mode.
Key ID	Unique ID of the CipherTrust Manager key.
Account	AWS account name.
Region	AWS region.
Algorithm	Name of the algorithm. Supported algorithms are: • SYMMETRIC_DEFAULT • RSA_2048 • RSA_3072 • RSA_4096 • ECC_NIST_P256 • ECC_NIST_P384 • ECC_NIST_P521 • ECC_SECG_P256K1
Source Key	Name of the source key.
Source Type	Source of the key. • CipherTrust (Local): Local CipherTrust Manager • DSM: Vormetric Data Security Manager • Luna: HSM Luna • CipherTrust (External): External CipherTrust Manager.

Field	Description
Key State	State of the key. The state can be: • Enabled • Disabled • Deleted • PendingDeletion • PendingImport • Unavailable
Creation Date	Time when the key is created.
Origin	The origin of the key can be: • BYOK-CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • BYOK - External: Source of the key material is unknown. It is different than CCKM and the native cloud. • HYOK-CCKM: HYOK key exists on CCKM • HYOK-External: An external key from KMS, without the corresponding HYOK key on the local CCKM. This can mean that the HYOK key is present on a different CCKM not clustered with the local one, or that the HYOK key is present on another vendor's external key manager. NOTE: When the CipherTrust Manager is upgraded from 2.0 to 2.1, the Origin column appears blank. The column will be populated on next scheduled key synchronization or on-demand synchronization by clicking the Sync All button.
Expiration Date	Time when the key will expire. Expiration date is nonapplicable for some key types.
Expiration State	State of the expiration.
Regionality	Whether the key is a single-region key, multi-region primary key, or multi-region replica key.
Cloud	Name of the AWS cloud.
Key Usage	How the key is used - for example, to decrypt and encrypt or to sign and verify.
Source Key Container	Container of the source key. A container can be the CipherTrust Manager, DSM, or Luna HSM.
Key Store	(Applicable to HYOK keys) Name of the key store.

Some of these fields are not populated for HYOK keys. The non-populated fields are **Alias**, **Key ID**, **Key State**, and **Creation Date**.

The **Regionality**, **Cloud**, **Key Usage**, and **Source Key Container** columns are hidden by default. To show/hide a column, click the custom view icon (⚙️), select/clear the desired column, and click **OK**. The **Key Usage** column is not populated for HYOK keys.

Sometimes, you might notice certain keys are displayed as grayed out. This happens when the keys are no longer accessible. For example, when:

- Any cloud permissions on the keys are changed. The keys are no longer accessible from the AWS connection.
- Connection is changed in AWS KMS. The new connection does not have permissions to access the keys.
- When AWS regions are changed or removed. The keys from the configured region are no longer accessible.

Creating Replica of Multi-Region Keys

Note

This functionality is applicable to Native and BYOK keys.

A multi-region key can be replicated in multiple AWS regions. By default, the base key will be referred to as the multi-region primary key. Later, you can set any replica of the multi-region key as the primary key.

Note

Only one replica of a primary key can be created in one AWS Region. Moreover, a replica of a replica key cannot be created.

To add a replica:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the alias of the desired multi-region primary key. The detail view of the key is displayed.
4. Scroll down to the **REGIONALITY** section.
5. Click **Add Replicas**. The Add Replica Region screen of the Add Replica Keys dialog box is displayed.

Add Replica Region

1. From the **Select Replica Region** drop-down list, select the AWS region where you want to create the replica key.

-
2. Click **Next**. The Add Labels screen is displayed.

Add Labels

The fields on the Add Labels screen display the current values of the primary key, but you can edit them at any time. AWS KMS does not synchronize any changes to these values.

1. Enter a user-friendly **Alias** for the replica key. This helps uniquely identify the replica key.
2. (Optional) Provide a brief **Description** of the key.
3. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.

CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters **** _ . / = + - @ ****

- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

4. Click **Next**. The Key Policy screen is displayed.

On the **Key Policy** screen, you can specify a policy for the key. If you skip the Key Policy screen by clicking **Next**, a default policy will be applied to the key.

Key Policy

Specify a policy for the key. You can create a new policy, select a saved policy, and build from template.

Click the desired tab to view the instructions.

Create New Policy

1. Select the **Create New Policy** option.
2. Select a policy view. You can select either the Basic view or Raw view. The default view is Basic.

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

In the Basic view, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.

- b. Click the **Key Users** tab.
- c. Select the desired key users.
- d. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

3. Select **Save this Key Policy** and **Enter Name**.
4. Click **Next**.

Select Saved Policy

1. Select the **Select Saved Policy** option.
2. Select a policy from the **Saved Policies** drop-down list.

Click **View Policy (Raw)** to view the policy in source JSON.

3. Click **Next**.

Build From Template

1. Select the **Build From Template** option.
2. **Select Template**.
3. (Optional) Make the necessary changes in the template.
4. Click **Next**.

The Review screen is displayed.

Review

This screen shows the replica key details that you have provided. These details are divided into REPLICA REGION, LABELS, AWS KEY POLICY, and CONFIRMATION sections.

Before adding the replica key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **REPLICA REGION** and **LABELS** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Under **CONFIRMATION**, select **I understand that the values I choose here are not synchronized with any other Multi-Region Key**.
3. Click **Add Replica Key**. Your key is successfully added. Close window to return to replica keys list.
4. Click **Close**. The Add Replica Keys wizard is closed.

The newly created replica key is displayed in the list of replica keys under the **REGIONALITY** section. The Regionality of a replica key is displayed as **REPLICA** and its Status moves from **Starting** to **PendingImport**.

Viewing Replicas of a Multi-Region Key

Note

This functionality is applicable to Native and BYOK keys.

To view the replicas of a multi-region key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the alias of the desired multi-region primary key. The detail view of the key is displayed. To view or edit an AWS key:
4. Scroll down to the **REGIONALITY** section. This section shows the replicas of the multi-region primary key. The section shows the following details:

Field	Description
Region	Region where the replica is created.
Key ARN	Amazon Resource Name (ARN) of the AWS replica.
Alias	Alias of the replica key.
State	State of the replica key.
Regionality	Regionality of the replica key is REPLICA .
Creation Date	Date and time when the replica is created.

Viewing or Editing AWS Key Details

To view or edit an AWS key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **View/Edit**.
4. For HYOK keys, you can obtain the following additional values:
 - The **XKS ID**. You can copy this value using the copy button, if you want to manually create a corresponding KMS key. In AWS, this value is called the **External key ID**.
 - The **Source**. This is a link to the CCKM-managed source key stored within either Luna HSM or CipherTrust Manager (depending on which key source you are using). This is important if you want to perform any key functions using either [Luna key functions](#) or [CipherTrust Manager key functions](#).

Note

You can view but not edit details for unlinked HYOK keys.

5. For Native, linked HYOK keys, and BYOK Keys, edit or configure the following fields and click **Update**:
 - **POLICY**: Grant access to external accounts, key administrators, and key users. Refer to [Adding/Editing Policies](#) for details.
 - **ALIASES**: Add or delete aliases of the key.
 - **LABELS**: Add tags to the key. Refer to [Add Labels](#) for characters allowed in AWS tag values.
 - **SCHEDULES**: Applies rotation schedule to the key. Refer to [Apply Key Rotation Schedule](#) for details.

Note

- You can only view and remove the schedule if you have assigned it to the existing AWS native key that has an algorithm as SYMMETRIC_DEFAULT. After you remove the schedule, this section will be hidden.
- If a new AWS native key is created that has an algorithm as SYMMETRIC_DEFAULT, the key will not have the SCHEDULES section.

- **AWS AUTOMATIC KEY ROTATION:** Automatically rotates AWS native key after a specified time period. To automatically rotate the key, enable **automatic key rotation** and enter the **Rotation period (in days)**.

Based on the entered rotation period, the next rotation date will be displayed.

Note

- The default rotation period is 365 days.
- Automatic key rotation only applies to the AWS native keys that have the algorithm as SYMMETRIC_DEFAULT.
- If the next rotation date is not displayed, click the **Refresh** icon.

- **ROTATION HISTORY:** Rotate the key. Refer to [Rotation History](#) for details.

Adding or Deleting Aliases

Note

This functionality is applicable to Native, BYOK, and CloudHSM keys. For HYOK keys, this functionality is applicable to linked keys only.

To **add** a new alias to the key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **View/Edit**.
4. Under **ALIASES**, click **Add Alias**.
5. Enter an **Alias Name**.
6. Click **Save**. The new alias is added to the key.

The AWS Keys page shows the latest alias under the Alias field. Additional aliases for the key are displayed in braces. For example, if a key has three aliases and the latest alias is "latest-alias", the Alias field shows "latest-alias (+2 more)". Clicking the link takes to the Aliases section of the key in edit mode.

To **delete** an alias of the key:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **View/Edit**.
4. Under **Aliases**, click the overflow icon () corresponding to the desired alias.
5. Click **Delete**. The alias is deleted.

Apply Key Rotation Schedule

Note

For HYOK keys, this functionality is applicable to linked keys only.

To apply a key rotation schedule to an AWS key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **View/Edit**.
4. Under **SCHEDULES**, from the **Rotation** drop-down list, select a schedule to apply. If applying a schedule to a CloudHSM key or linked HYOK key, proceed to step 7.

Note

If the selected scheduled rotation has Rotate Key Material (Imported AES Keys) enabled, you will see it alongside the rotation name.

5. (Optional) For BYOK or Native keys, you can grant or deny the encrypt permission to the key policy in the AWS account where the key is created in OR to the key policy in *all accounts* the key is shared in:
 - Select **Disable Encrypt Permissions on Current Key** to deny the encrypt permission to the key policy in the AWS account where the key is created in. Clear the check box to grant the encrypt permission. By default, **Disable Encrypt Permissions on Current Key** is selected, that is, the encrypt permission is denied to the current key.
 - Select **Disable Encrypt Permissions on All Accounts** to deny the encrypt permission to the key policy in all the AWS accounts the key is shared in. Clear the check box to grant the encrypt permission.
6. For BYOK or Native keys, select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (External)**: External CipherTrust Manager.

- **CipherTrust (Local)**: Local CipherTrust Manager.
- **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
- **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.

Note

If the algorithm of the key is RSA, EC, or HMAC, you can only select **CipherTrust (Local)** as the Key Origin.

7. Click **Update**.

Note

A scheduled key rotation always creates a new key with a randomly generated UUID name.

Rotation History

You can view the details and perform a new rotation for Native and BYOK keys using the SYMMETRIC_DEFAULT algorithm.

- Native keys with the SYMMETRIC_DEFAULT algorithm: You can view the Key Material ID, Date, State, and Type of the key rotation.

To perform a new rotation:

- a. Click **Rotate Key**, the AWS On-Demand Key Rotation dialog box is displayed.
- b. Click **Rotate**.

Warning

As of now, you can only initiate AWS On-Demand Key Rotation 10 times by default.

Note

- On-demand key rotation applies to the AWS native keys that have the algorithm as

SYMMETRIC_DEFAULT.

- If the latest rotation history details are not displayed, click the **Refresh** icon.

- BYOK keys with the SYMMETRIC_DEFAULT algorithm: You can view the Key Material ID, Rotation Date, Key Material State, Import State, Source Type, Origin, Expiration Date, and Key Material Description of the key rotation.

To perform a new rotation, refer to the [Rotating Keys](#) section.

For BYOK keys, you can also promote a key material to current, and re-import, update, or delete it.

Promote to Current: To promote a key material to current:

- a. Click the overflow icon () next to the desired key rotation and select **Promote to Current**. The Promote to Current dialog box is displayed.
- b. Click **Rotate**.
- c. Click **OK**.

Note

You can promote a key material to current only when it's first in the list and its state is Pending Rotation.

Re-Import: To re-import a key material.

- a. Click the overflow icon () next to the desired key rotation and select **Re-Import Key Material**. The Re-Import Key Material dialog box is displayed.
- b. Click **Re-Import Key Material**.
- c. Click **Next**.
- d. (Optional) Select **Key Material Expiration Date**.
- e. (Optional) Enter **Description**.
- f. Click **Next**.
- g. Click **Import**.
- h. Click **OK**.

Note

- You can re-import key material after it has been deleted.
- When all key materials have been imported, the Key State becomes **Enabled**. If any key materials are pending import, the Key State remains **Pending import**.

Update: To update a key material.

- Click the overflow icon () next to the desired key rotation and select **Update Key Material**. The Update Key Material dialog box is displayed.
- (Optional) Select the **Set Expiration Date** check box.

Either enter the key material expiration time manually or select using the on-screen calendar. The time format is MM/DD/YYYY HH:MM, for example, September 16, 2020 1:50 PM.

To select a specific time, click **Time**, and select hours and minutes, from the GUI.

- (Optional) Enter **Description**.
- Click **Save**.

Delete: To delete a key material.

- Click the overflow icon () next to the desired key rotation and select **Delete Key Material**. The Delete Key Material dialog box is displayed.
- Click **Delete Key Material**.

Note

You can delete the imported key material.

Adding/Editing Policies

You can apply a new policy or edit the policy attached to an AWS key on the list view or the details view of the AWS Keys page.

On the list view of the AWS Keys page

Note

This functionality is applicable to all Native and BYOK keys. For HYOK keys, this functionality is applicable to linked keys only.

To add or edit key policy:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Add/Edit Policies**.

The Add/Edit Policies dialog box displays the attached policy, if any. Under **Unsaved Policy**, you can either:

- Update the policy locally. These are local changes only. They do not affect the original policy.

Alternatively, you can save the changes as a new policy. Click **Save to Policy List**, specify a **Policy Name**, and click **Save**. The newly created policy will be available as a saved policy for selection.

- Attach a new saved policy. Click **Select Saved Policy**, select a saved policy from the drop-down list, and click **Apply**.
- Select a template and use it to create a key policy. Click **Build from Template**, select a template from the drop-down list, and click **Apply**.

4. Click **Save**.

On the details view of the AWS Keys page

To add or edit key policy:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the **Alias** link of the key.
4. Navigate to the **POLICY** section.
5. Add or update the policy, as described [above](#).
6. Click **Update**.

Refreshing AWS Keys

Refreshing is the process of downloading keys created on the AWS KMS to CCKM.

Refreshing All Keys

You can refresh keys from all AWS KMS accounts at once.

Refreshing keys also refreshes [AWS CloudHSM key stores](#) and [external custom key stores](#).

Refreshing all keys can set unlinked HYOK keys to a linked state. This happens when CCKM detects a corresponding KMS key for an local unlinked HYOK key. As well, this operation can set unlinked external custom key stores to a linked state. This happens when CCKM detects a corresponding KMS external key store for an local unlinked external custom key store.

To refresh keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The AWS Keys page is displayed. This page displays the list of AWS keys.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all keys is a time intensive operation that could take several hours or days to complete. It will continue running in the background. Do you want to continue?

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > AWS > AWS Keys** page.

Refreshing a Desired Key

You can refresh a desired key from the list. To refresh an AWS key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**.
3. Click the overflow icon () corresponding to the desired alias and click **Refresh**.

A message 'Key refreshed successfully.' is displayed on the screen.

Disabling Keys

Note

This functionality is applicable to all Native, BYOK, and Cloud HSM keys. For HYOK keys, this functionality is applicable to linked keys only.

For HYOK keys, disabling has the same practical effect of disallowing cryptographic operations as **blocking** does. However, disabling changes the external key state on AWS KMS and blocking does not.

Caution

Take care when disabling a key. You cannot use this key in cryptographic operations and it may limit your access to certain resources that use this key. To reverse this action in the future, you can always choose to enable the key again.

To disable the key(s):

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Select the keys to be enabled from the list.
4. Click **Disable**. The Disable Key(s) dialog box is displayed.
5. Click **Disable**. The Job Created dialog box is displayed. A job is created to track the disabling of the keys.
6. Click **OK**.

You can check the job status on the **Bulk Operations** tab.

Enabling Keys

Note

This functionality is applicable to all Native, BYOK, and Cloud HSM keys. For HYOK keys, this functionality is applicable to linked keys only.

For HYOK keys, enabling has the same practical effect of allowing cryptographic operations as **unblocking** does. However, enabling changes the external key state on AWS KMS and unblocking does not.

Caution

Take care when disabling a key. You cannot use this key in cryptographic operations and it may limit your access to certain resources that use this key. To reverse this action in the future, you can always choose to enable the key again.

To enable the key(s):

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Select the keys to be enabled from the list.
4. Click **Enable**. The Enable Key(s) dialog box is displayed.
5. Click **Enable**. The Job Created dialog box is displayed. A job is created to track the enabling of the keys.
6. Click **OK**.

You can check the job status on the **Bulk Operations** tab.

Downloading Keys

Note

This functionality is applicable to asymmetric keys.

Asymmetric keys can be downloaded to your local machines. Symmetric keys cannot be downloaded.

To download an asymmetric key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Download Key**. The key is downloaded.

Importing Key Material

Note

This functionality is applicable to Native and BYOK keys.

You can create a key without key material and can later import the CipherTrust key material to the AWS KMS. As the key material is not created on the AWS KMS, its origin is external.

Note

You can only import AES keys with status **PendingImport** to the AWS KMS.

To import key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Import Material**. The Import Material dialog box is displayed.
4. **Select Import Type** (the desired key material source). The options are:
 - Import Using CipherTrust (External)
 - Import Using CipherTrust (Local)
 - Import Using Vormetric DSM
 - Import Using Luna HSM

Note

The Vormetric DSM key option will be available only for the keys that have the algorithm as SYMMETRIC_DEFAULT (AES).

Import Using CipherTrust (External)

When importing the key material from an external CipherTrust Manager, **Select Key Material Origin**. The options are:

-
- **Create New Key**
 - **Use Existing Key**

Create New Key

In this method, the external CipherTrust Manager creates the new key material locally.

1. Select **Create New Key**.
2. Click **Next**.
3. Enter **Key Name**.
4. **Select Domain** for the key. The drop-down list shows the domains of the external CipherTrust Manager linked with the configured connection.
5. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.
6. Click **Next**. The Review Key Details screen is displayed.
7. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
8. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed. When the status next to the SOURCE KEY section becomes Complete, the key material is imported successfully.

9. Click **OK**.

In this scenario, the CipherTrust creates a new key material and the key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Use Existing Key

In this method, the key material of an existing external CipherTrust Manager key is used.

1. Select **Use Existing Key**.
2. Click **Next**.
3. **Select Domain** from the drop-down list. The drop-down list shows the domains of the external CipherTrust Manager linked with the configured connection.
4. Select a **CipherTrust (External) Key** from the list.
5. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.

-
6. Click **Next**. The Review Key Details screen is displayed.
 7. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
 8. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed.

9. Click **OK**.

In this scenario, the existing key material of the external CipherTrust Manager is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Import Using CipherTrust (Local)

When importing the key material from CipherTrust, **Select Key Material Origin**. The options are:

- [Create New Key](#)
- [Use Existing Key](#)

Create New Key

In this method, CipherTrust Manager creates the new key material locally.

1. Select **Create New Key**.
2. Click **Next**.
3. Enter **Key Name**.
4. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.
5. Click **Next**. The Review Key Details screen is displayed.
6. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
7. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed. When the status next to the SOURCE KEY section becomes Complete, the key material is imported successfully.

8. Click **OK**.

In this scenario, the CipherTrust creates a new key material and the key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Use Existing Key

In this method, the key material of an existing CipherTrust Manager key is used.

1. Select **Use Existing Key**.
2. Click **Next**.
3. Select a **CipherTrust (Local) Key** from the list.
4. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.
5. Click **Next**. The Review Key Details screen is displayed.
6. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
7. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed.

8. Click **OK**.

In this scenario, the existing CipherTrust key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Import Using Vormetric DSM

When importing the key material from Vormetric DSM, **Select Key Material Origin**. The options are:

- [Create New Key](#)
- [Use Existing Key](#)

Create New Key

In this method, DSM creates the new key material locally.

1. Select **Create New Key**.
2. Click **Next**.
3. Enter a **DSM Key Name**.
4. Select the desired **DSM Domain**.
5. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.
6. Click **Next**. The Review Key Details screen is displayed.

7. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
8. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed. When the status next to the SOURCE KEY section becomes Complete, the key material is imported successfully.

9. Click **OK**.

In this scenario, the DSM creates a new key material and the key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Use Existing Key

In this method, the key material of an existing DSM key is used.

1. Select **Use Existing Key**.
2. Click **Next**.
3. Select a **DSM Key** from the list.
4. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.
5. Click **Next**. The Review Key Details screen is displayed.
6. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
7. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed.

8. Click **OK**.

In this scenario, the existing DSM key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Import Using Luna HSM

When importing the key material from Luna HSM, **Select Key Material Origin**. The options are:

- [Create New Key](#)
- [Use Existing Key](#)

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Create New Key

In this method, Luna HSM creates the new key material locally.

1. Select **Create New Key**.
2. Click **Next**. The Add Key Details page is disabled.
3. Enter a **Key Name**.
4. Select the desired **Partition ID**.
5. Select the desired **Key Attributes**.
6. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.
7. Click **Next**. The Review Key Details screen is displayed.
8. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
9. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed. When the status next to the SOURCE KEY section becomes Complete, the key material is imported successfully.

10. Click **OK**.

In this scenario, the Luna HSM creates a new key material and the key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Use Existing Key

In this method, the key material of an existing Luna HSM key is used.

1. Select **Use Existing Key**.
2. Click **Next**. The Add Key Details page is disabled.
3. Select an **HSM Key** from the list.
4. (Optional) Select the **Key Material Expiration Date** from the on-screen calendar.

5. Click **Next**. The Review Key Details screen is displayed.
6. Review the key details. If the details are incorrect or you want to modify them, click **Back** and update the details.
7. Click **Import**.

The key import starts. An Import in Progress message is displayed on the screen. Leave the window open until the process is completed.

8. Click **OK**.

In this scenario, the existing Luna HSM key material is imported to the AWS KMS. The key state changes from PendingImport to Enabled. The Origin changes to **CCKM**.

Deleting Key Material

Note

This functionality is applicable for BYOK keys, not HYOK keys. You can delete [unlinked HYOK keys](#) or [schedule key deletion for linked HYOK keys](#) through AWS menus, but not their source key material.

For HYOK keys, Luna source keys are managed through [CCKM Luna key functions](#), and CipherTrust Manager source keys are managed through [CipherTrust Manager key management menus](#).

To delete key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Delete Material**. The Delete Key Material dialog box is displayed.
4. Select **I wish to delete key material**.
5. Click **Delete Key Material**.

A message **AWS Key material deleted** is displayed on the screen. The key state changes to **PendingImport**.

Warning

Be extremely careful when deleting a key material from the AWS KMS. Once the key material is deleted, decryption of data cannot be performed using that key material. However, if needed, you can reimport the key material.

Scheduling Key Deletion

Note

This functionality is applicable to all Native, BYOK, HYOK keys and CloudHSM keys. For HYOK keys, this functionality is applicable to linked keys only.

Scheduled key deletion permanently removes the key from the AWS KMS (if a Native, linked HYOK, or BYOK key) or from the AWS CloudHSM (if a CloudHSM key) at the specified time. The AWS KMS enforces a waiting period of 7 to 30 days. You can cancel schedule deletion before the waiting period ends.

For linked HYOK keys, scheduling deletion removes the local CCKM HYOK key, and the remote KMS key at the specified time. Unlinked HYOK keys can only be [deleted manually](#), not at a scheduled time. Deleting an HYOK key does not delete the source key (stored in either an Luna HSM or CipherTrust Manager. You can later [create a new HYOK key using the source key](#).

Note

In regards to Native and BYOK keys, schedule key deletion is not allowed for multi-region primary keys that have replicas. To schedule deletion of such a key, delete its replica keys first.

Warning

Be extremely careful when scheduling key deletion. Once the key is deleted from the AWS KMS or from the AWS CloudHSM (if a CloudHSM key), it cannot be restored and the data encrypted with this key will be unrecoverable.

For HYOK keys, if you want to temporarily suspend AWS KMS access, you can instead [block the HYOK key](#).

Scheduling Deletion of an AWS Key

To schedule the deletion of an AWS key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Schedule Key Deletion**.
4. On the Schedule Key Deletion screen:
 - a. Select **I wish to delete this key**.

- b. Specify the **Waiting period (in Days)** after which the key will be deleted. The default value is 30.
- c. Click **Schedule Deletion**.

A message **Key <key_name> scheduled for deletion** is displayed on the screen. The key state changes to **PendingDeletion**.

Scheduling Deletion of Multiple AWS Keys

To schedule the deletion of multiple AWS keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Select the checkboxes next to the keys you want to schedule for deletion.
4. Click **Schedule Key Deletion**.
5. On the Schedule Key Deletion screen:
 - a. Select **I wish to delete this key**.
 - b. Specify the **Waiting period (in Days)** after which the key will be deleted. The waiting period must be between 7 and 30 days. The default value is 30.
 - c. Click **Schedule Deletion**. The Job Created dialog box is displayed. A job is created to track the deletion of the keys.
 - d. Click **OK**.

You can check the job status on the **Bulk Operations** tab.

Canceling Scheduled Deletion

This functionality is applicable to Native, BYOK, and CloudHSM keys.

Warning

Be extremely careful when scheduling key deletion. Once the key is deleted from the AWS KMS, it cannot be restored and the data encrypted with this key will be unrecoverable.

Canceling the Scheduled Deletion of an AWS Key

To cancel the scheduled deletion of an AWS key:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Cancel Deletion**.

A message Scheduled deletion cancelled is displayed on the screen. The key state changes to Disabled. You can enable the key, if you wish to use this key in the cryptographic operations.

Canceling the Scheduled Deletion of Multiple AWS Keys

To cancel the scheduled deletion of multiple AWS keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Select the checkboxes next to the keys whose scheduled deletion you want to cancel.
4. Click **Cancel Key Deletion**. The Cancel Schedule Key Deletion screen opens.
5. Click **Cancel Schedule Deletion**. The Job Created dialog box is displayed. A job is created to track the cancellation of scheduled deletion for AWS keys.
6. Click **OK**.

You can check the job status on the **Bulk Operations** tab.

Deleting Unlinked HYOK Keys

Deleting an unlinked HYOK Key deletes the XKS ID that is associated to a KMS key in AWS KMS. The corresponding KMS key is not deleted, but it can no longer perform cryptographic operations. For linked HYOK keys, you can [schedule a key deletion](#) to delete both the HYOK key on CCKM and the KMS key in AWS KMS.

Warning

Deleting an HYOK key permanently breaks the association between the corresponding KMS key and this particular XKS ID so that KMS key can no longer perform cryptographic operations. Any data encrypted with the KMS key cannot be decrypted. To temporarily suspend AWS KMS access to the HYOK key and its XKS ID, you can instead [block the HYOK key](#).

Deleting an HYOK key does not delete the source key (stored in either an Luna HSM or CipherTrust Manager). You can later [create a new HYOK key using the source key](#). Luna source keys are managed through [CCKM Luna key functions](#), and CipherTrust Manager source keys are managed through [CipherTrust Manager key management menus](#).

To delete an unlinked HYOK key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.

You can filter this list on **Origin: CCKM-HYOK** to display only HYOK keys.

3. Click the overflow icon () corresponding to the desired alias and click **Delete**. The Delete Key dialog box is displayed.
4. Click **Delete Key** to confirm.

Rotating Keys

Key rotation is a critical security best practice that involves updating the cryptographic material used by your keys. CCKM offers several ways to manage key rotation for your AWS keys.

Understanding Key Rotation Mechanisms in CCKM

CCKM supports different approaches to key rotation depending on the key type and origin:

- **Material Rotation (Retaining Key ID and ARN):** This is the primary rotation method facilitated by CCKM's "Rotate Key" feature for symmetric single-region BYOK keys and Native AWS keys, where algorithm is SYMMETRIC_DEFAULT. It involves associating new cryptographic material with the *existing* AWS KMS Key ID and ARN. The key's identity in AWS remains the same, but the underlying material changes. This is particularly relevant for BYOK symmetric keys.
- **AWS-Managed Automatic Rotation:** For Native AWS keys using the SYMMETRIC_DEFAULT algorithm, AWS KMS can automatically rotate the key material. CCKM allows you to enable and manage this feature.
- **HYOK Key Versioning:** For HYOK keys, rotation (termed "Add Version (Rotate)") involves associating a new version of the source key (from CipherTrust Manager or a new Luna HSM key) with the existing HYOK entity in CCKM. The HYOK key in AWS KMS then uses this new material for future operations.
- **CloudHSM Key Rotation:** For keys stored in an AWS CloudHSM custom key store, CCKM triggers a rotation command that instructs AWS CloudHSM to generate new key material for the existing key within the HSM.
- **Manual Alias-Based Rotation (New Key ID and ARN):** As a general key management strategy, for any key type, you can manually achieve a form of rotation by:
 - a. Creating an entirely new AWS key with fresh key material (see [Creating Native Key Material](#) or [Adding Key Material Using External \(BYOK\) Source](#)).
 - b. Removing the alias from the old key.
 - c. Adding that alias to the newly created key.

This method results in a new AWS KMS Key ID and ARN. It's a manual process and distinct from CCKM's "Rotate Key" feature which often aims to retain the existing Key ID.

General Steps to Initiate Key Rotation via CCKM UI

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.
3. Locate the key you wish to rotate. Click the overflow icon () corresponding to its alias.
 - For **Native**, **BYOK**, or **CloudHSM** keys, click **Rotate Key**.
 - For **HYOK** keys, click **Add Version (Rotate)**.

The subsequent steps depend on the type of key you are rotating, as detailed in the sections below.

Rotating Native AWS Keys

The process for rotating Native AWS keys varies based on their configuration.

1. Native Keys with SYMMETRIC_DEFAULT Algorithm (AWS-Managed Rotation)

If you are rotating an AWS native key that uses the **SYMMETRIC_DEFAULT** algorithm, CCKM can initiate an AWS on-demand key rotation or manage AWS's automatic rotation schedule.

- **On-Demand Rotation**
 - After clicking **Rotate Key**, an "AWS On-Demand Key Rotation" dialog box may appear.
 - Click **Rotate** in the dialog, then **OK** to confirm.
 - Alternatively, this option might be available in the key's "View/Edit" screen under "ROTATION HISTORY". Refer to [ROTATION HISTORY](#) for details.

Warning

AWS KMS may have a default limit on how many times you can initiate on-demand key rotation (for example, 10 times by default). Consult AWS documentation for the most current information.

- **Scheduled Automatic Rotation:** You can enable AWS automatic key rotation and set a rotation period via the key's "View/Edit" screen under "AWS AUTOMATIC KEY ROTATION".

Note

For these AWS-managed rotations, you do not select new key material from an external source like CipherTrust Manager; AWS manages the generation of the new key material.

2. Native Asymmetric Keys or Other Native Key Types

For other types of Native AWS keys (such as asymmetric keys, HMAC keys, etc.), key rotation will create a new BYOK key and reassign the alias from the existing Native AWS key to the newly created BYOK key. Follow the instructions for [Material Rotation \(BYOK and applicable Native Keys\)](#) below.

Rotate BYOK Keys

The process for rotating AWS BYOK keys varies based on their configuration.

1. Single region BYOK keys with SYMMETRIC_DEFAULT Algorithm

When you rotate BYOK keys, CCKM's Rotate Key feature helps update the cryptographic material for the existing AWS Key ID and ARN. You provide new key material from a supported source. Follow the instructions for [Material Rotation \(BYOK and applicable Native Keys\)](#) below.

Alternatively, this option might be available in the key's "View/Edit" screen under "ROTATION HISTORY". Refer to [ROTATION HISTORY](#) for details.

Warning

AWS KMS may have a default limit on how many times you can initiate on-demand key rotation (for example, 10 times by default). Consult AWS documentation for the most current information.

Note

- **Key Material Requirement:** The new key material you upload (whether created as a new source key in CipherTrust Manager/HSM or by selecting an existing source key from these systems) **must not have been previously imported or associated with this specific AWS KMS key**. Each rotation requires distinct cryptographic material for the target AWS KMS key.
- If you prefer the traditional method of creating an entirely new key with a new ID/ARN, or if specific configurations necessitate it, you can achieve rotation manually as described in [Understanding Key Rotation Mechanisms in CCKM](#) under "Manual Alias-Based Rotation".

2. Other BYOK Keys

For other types of BYOK keys (such as asymmetric keys, multi-region symmetric keys, or HMAC keys), key rotation creates a new BYOK key and moves the alias from the existing key to the new one.

Steps for Material Rotation (BYOK and applicable Native Keys)

1. After clicking **Rotate Key** (as described in [General Steps to Initiate Key Rotation](#)), the **Select Material Origin**

screen appears.

2. Choose the source for the new key material. Options typically include:
 - **Upload New CipherTrust (External) Key:** Create a new key on an external CipherTrust Manager.
 - **Upload Existing CipherTrust (External) Key:** Use an existing key from an external CipherTrust Manager.
 - **Upload New Vormetric DSM Key:** Create a new key on a Vormetric DSM. (Available for SYMMETRIC_DEFAULT/AES keys)
 - **Upload Existing Vormetric DSM Key:** Use an existing key from a Vormetric DSM. (Available for SYMMETRIC_DEFAULT/AES keys)
 - **Upload New Luna HSM Key:** Create a new key on a Luna HSM.
 - **Upload Existing Luna HSM Key:** Use an existing key from a Luna HSM.
 - **Upload New CipherTrust (Local) Key:** Create a new key on the local CipherTrust Manager.
 - **Upload Existing CipherTrust (Local) Key:** Use an existing key from the local CipherTrust Manager.

Note

When rotating BYOK keys with the SYMMETRIC_DEFAULT algorithm, do not reuse any previously used key material.

Select your desired option and click **Next**.

3. Configure source key details. The next screen will prompt you to either create a new source key or select an existing one, based on your choice.
 - If you selected **Upload New ... Key:**
 - For CipherTrust (External) Key:
 - a. **Select Domain** from the drop-down list.
 - b. Specify a unique **Key Name** for the new source key.
 - For CipherTrust (Local) Key: Specify a unique **Key Name** for the new source key.
 - For Vormetric DSM Key:
 - a. Specify a unique **DSM Key Name**.
 - b. Select the desired **DSM Domain**.

- For Luna HSM Key:

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- Specify a unique **Key Name** for the new source key.
 - Select the desired **Partition ID**.
 - Review the displayed **Key Attributes**.
- If you selected **Upload Existing ... Key**:
 - For CipherTrust (External) Key: Select the desired **CipherTrust (External) Key** from the list.
 - For CipherTrust (Local) Key: Select the desired **CipherTrust (Local) Key** from the list.
 - For Vormetric DSM Key: Select the desired **DSM Key** from the list.
 - For Luna HSM Key:

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Select the desired **HSM Key** from the list.

Click **Next**.

- Configure destination key properties (Add Labels screen).
- Click the desired tab to view the instructions.

Single-region BYOK keys with the SYMMETRIC_DEFAULT algorithm

- (Optional) Provide a **Description** for this rotation instance or update the key's description.
- (Optional) Set or update a key **Expiration Date** for the new material:
 - Select the **Expiration Date** check box.

-
- b. Enter the date and time (for example, **MM/DD/YYYY HH:MM**) or use the calendar.
 - c. Click **Next**.
 - d. Review and update the rotate key material details that you have provided. These details are divided into MATERIAL ORIGIN and CONFIGURATION sections.
 - e. Before rotating the key, review all details. After the key is rotated, certain features will no longer be editable.
 - f. Click **Rotate**.
 - g. Click **OK**. The Rotate Key Material wizard is closed.

Other BYOK Keys

The **Alias** of the current AWS key being rotated is pre-populated.

- a. (Optional) Provide a **Description** for this rotation instance or update the key's description.
 - b. (Optional) Set or update a key **Expiration Date** for the new material:
 - a. Select the **Expiration Date** check box.
 - b. Enter the date and time (for example, **MM/DD/YYYY HH:MM**) or use the calendar.
 - c. (Optional) For BYOK or Native keys, you can grant or deny the encrypt permission to the key policy in the AWS account where the key is created in OR to the key policy in *all accounts* the key is shared in:
 - Select **Disable Encrypt Permissions on Current Key** to deny the encrypt permission to the key policy in the AWS account where the key is created in. Clear the check box to grant the encrypt permission. By default, **Disable Encrypt Permissions on Current Key** is selected, that is, the encrypt permission is denied to the current key.
 - Select **Disable Encrypt Permissions on All Accounts** to deny the encrypt permission to the key policy in all the AWS accounts the key is shared in. Clear the check box to grant the encrypt permission.
 - d. (Optional) Select the **Apply Gravestone Alias on Current Key** check box to retain the current key's alias (with a timestamp) on the archived key material/version after rotation. If not selected, the alias is not retained on the old key version.
 - e. Click **Save**. A message will confirm successful key material creation (if applicable) and key rotation for the AWS key.
-

Rotating CloudHSM Keys

Rotating a CloudHSM key involves CCKM instructing AWS CloudHSM to generate new key material for the existing key within the CloudHSM cluster. The Key ID in AWS KMS remains the same.

1. After clicking **Rotate Key** (as described in General Steps to Initiate Key Rotation), the Rotate Key screen (or a similar confirmation screen) appears.
2. (Optional) Provide a **Description** for this rotation instance.
3. Disable encrypt permissions on the current key (old material).
 - a. (Optional) For BYOK or Native keys, you can grant or deny the encrypt permission to the key policy in the AWS account where the key is created in OR to the key policy in *all accounts* the key is shared in:
 - b. Select **Disable Encrypt Permissions on Current Key** to deny the encrypt permission to the key policy in the AWS account where the key is created in. Clear the check box to grant the encrypt permission. By default, **Disable Encrypt Permissions on Current Key** is selected, that is, the encrypt permission is denied to the current key.
 - c. Select **Disable Encrypt Permissions on All Accounts** to deny the encrypt permission to the key policy in all the AWS accounts the key is shared in. Clear the check box to grant the encrypt permission.

By default, encrypt permissions are disabled on the current (old) key material after rotation. Clear the check box to keep them enabled on the old material.
4. (Optional) Select the **Apply Gravestone Alias on Current Key** checkbox if you wish to retain the key alias (with a timestamp) on the archived key material *after* rotation. If not selected, the alias is not retained on the old key version.
5. Click **Save** (or **Rotate**). A message will confirm successful key rotation.

Rotating HYOK Keys (Add Version / Rotate)

Rotating a Hold Your Own Key (HYOK) involves associating new cryptographic material (either a new source key or a new version of an existing source key from your CipherTrust Manager or Luna HSM) with the HYOK entity in CCKM. This new material will be used for future encryption operations by the corresponding AWS KMS key. Decryption operations on data encrypted with previous key material will continue to use the older material.

Note

After rotation, the HYOK key in CCKM (and by extension, the AWS KMS key) is associated with multiple source keys/versions.

- **New Encrypt Operations:** Will use the newly rotated (latest) key material.
- **Decrypt Operations:** Will use the key material version that originally encrypted the data.

Warning

- **Blocking/Unblocking:** To temporarily suspend AWS KMS access to an HYOK and its source key(s), block the HYOK key. This is reversible.
- **Deleting HYOK Key in CCKM:** Deleting the HYOK key in CCKM or scheduling its deletion can make data encrypted with the corresponding AWS KMS key unrecoverable.
- **Deleting Source Key:** Deleting the underlying source key directly in Luna HSM or CipherTrust Manager will also render data unrecoverable. Manage source keys via their respective management interfaces (Luna HSM keys or CipherTrust Manager keys).

Steps

After clicking **Add Version (Rotate)** (as described in General Steps to Initiate Key Rotation), the **Select Material Origin** screen (or a direct confirmation for CM key versioning) appears.

Option 1: Create New CipherTrust Manager Key Version (for CipherTrust Manager sourced HYOK keys)

If your HYOK key's source is a CipherTrust Manager key, rotation typically involves creating a new version of that existing source key.

1. From the "Add Version (Rotate) Key" screen (this might be a direct confirmation dialog if only this option is available for the key), click **Rotate Key** (or similar confirmation) to proceed.
2. Leave the dialog open until the rotation operation completes successfully.

Option 2: Create a New Luna HSM Key (for Luna HSM sourced HYOK keys)

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

You can create an entirely new source key in your Luna HSM to associate with the HYOK.

1. On the Select Material Origin screen, select **Create New Luna HSM Key**.
2. Click **Next**. The Configure Source Key screen is displayed.
3. Provide a new **Source Key Name** for the key to be created in the Luna HSM.

Note

Key attributes for the new Luna HSM key will be displayed and are typically not editable, ensuring they meet HYOK requirements.

4. Click **Next** to proceed to the **Review and Rotate Key** screen.
5. Review the key details and click **Rotate** to confirm.
6. Leave the dialog open until the rotation operation completes successfully.

Option 3: Use Existing Luna HSM Key (for Luna HSM sourced HYOK keys)**Note**

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

You can use another existing AES-256 key from your Luna HSM as the new cryptographic material for the HYOK.

1. On the Select Material Origin screen, select **Use Existing Luna HSM Key**.
2. Click **Next**. The Configure Source Key screen is displayed.
3. Select the desired key from the **Select Luna Key** drop-down list.

Note

The existing Luna HSM key must be AES-256 and have the following attributes:

- CKA_EXTRACTABLE = FALSE
- CKA_SENSITIVE = TRUE
- CKA_ENCRYPT = TRUE
- CKA_DECRYPT = TRUE
- CKA_WRAP = TRUE
- CKA_UNWRAP = TRUE

4. Click **Next** to proceed to the **Review and Rotate Key** screen.
5. Review the key details and click **Rotate** to confirm.
6. Leave the dialog open until the rotation operation completes successfully.

Blocking and Unblocking HYOK Keys

Blocking and unblocking an HYOK key is a way to temporarily suspend and restore AWS KMS's access to the HYOK key and its source key. This way, you do not [permanently delete the HYOK key and the XKS ID](#) which AWS KMS needs to communicate to the HYOK and source key.

Block a Key

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.

You can filter this list on **Origin: HYOK-CCKM** to display only local HYOK keys.

3. Click the overflow icon () corresponding to the desired key and click **Block Key**.
4. Confirm you wish to block the key by clicking **Block** in the Block Key dialog.

Unblock a Key

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. The list of available AWS keys is displayed.

You can filter this list on **Origin: HYOK-CCKM** to display only local HYOK keys.

3. Click the overflow icon () corresponding to the desired key and click **Unblock Key**.
4. Confirm you wish to unblock the key by clicking **Unblock** in the Block Key dialog.

Scheduling Operations

CCKM allows you to periodically refresh or rotate keys in the background. To refresh or rotate keys, you need to create schedule configuration. A schedule configuration defines when to run a refresh or rotation job. You can use either basic format or cron format to specify the time when the rotation or refresh job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- Repeats: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.

- **at:** specific time at which the rotation or refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

```
" * * * * * "
```

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. **Select Schedule Type as Key Rotation.**
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - From the **Cloud Name** drop-down list, select **AWS**.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. Set the values on the **Schedule Config** screen.

You can schedule configuration for:

- **All Keys:** Refer to [Configuring Rotation Schedule for All Keys](#) for details.
- **Only Expiring Keys:** Refer to [Configuring Rotation Schedule for Expiring Keys](#) for details.
- **All Keys Based on Creation/Last Rotation Date:** Refer to [Configuring Rotation Schedule for All Keys Based on Creation or Last Rotation Date](#) for details.

Configuring Rotation Schedule for All Keys

To configure rotation schedule for all keys:

1. Configure **DURATION** for the scheduler. Specify the following values:

- a. **Schedule Starts**
- b. **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

2. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either the **Basic** or the **Raw (Cron)** format to specify the value.
3. (Optional) Set the expiry of the new key that will be created through rotation. If not specified, the new key material never expires. For example, if you set the expiry time to **6 Hours**, the key material of the new key will expire in 6 hours.
4. (Optional) Enable **Rotate Key Material (Imported AES Keys)**.

Warning

Key material rotation is only available for imported symmetric AES single-region keys (BYOK). Other key types can be rotated by creating a new key and reassigning the alias.

5. Select **Apply Gravestone Alias on Current Key** to retain the key alias with timestamp on the archived key after rotation. The format of the Gravestone alias is `<current alias>-rotated-<timestamp>`. The alias will only be applied to keys with an existing alias.
6. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Configuring Rotation Schedule for Expiring Keys

To configure rotation schedule for expiring keys:

1. In the **SELECTION** section, select the keys to be rotated based on their expiry time. In the **Only rotate keys within _ of material expiration** field, select or enter the key expiry time. For example, if the value of **Only rotate keys within _ of material expiration** field is set to **4 Days**, then the rotation schedule is created for all the keys that will expire in 4 days.
2. Configure **DURATION** for scheduler. Specify the following values:
 - a. **Schedule Starts**
 - b. **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.
3. (Optional) Set the expiry of the new key that will be created through rotation. If not specified, the new key material never expires. For example, if you set the expiry time to **6 Hours**, the key material of the new key will expire in 6 hours.
4. (Optional) Enable **Rotate Key Material (Imported AES Keys)**.

Warning

Key material rotation is only available for imported symmetric AES single-region keys (BYOK). Other key types can be rotated by creating a new key and reassigning the alias.

5. Select **Apply Gravestone Alias on Current Key** to retain the key alias with timestamp on the archived key after rotation. The format of the Gravestone alias is `<current alias>-rotated-<timestamp>`. The alias will only be applied to keys with an existing alias.
6. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Configuring Rotation Schedule for All Keys Based on Creation or Last Rotation Date

To configure rotation schedule for all keys based on their creation or last rotation date:

1. In the **SELECTION** section, select the keys to be rotated based on their creation or last rotation date.

In the **Only rotate keys after _ of creation/last rotation date** field, select or enter the number of days, weeks, months, or years. For example, if the value of **Only rotate keys after _ of creation/last rotation date** field is set to **4 Days**, then all the keys will rotate after 4 days of their creation or last rotation date. The default duration is 7 Days.
2. Configure **DURATION** for scheduler. Specify the following values:

a. **Schedule Starts**

b. **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

3. (Optional) Set the expiry of the new key that will be created through rotation. If not specified, the new key material never expires. For example, if you set the expiry time to **6 Hours**, the key material of the new key will expire in 6 hours.
4. (Optional) Enable **Rotate Key Material (Imported AES Keys)**.

Warning

Key material rotation is only available for imported symmetric AES single-region keys (BYOK). Other key types can be rotated by creating a new key and reassigning the alias.

5. Select **Apply Gravestone Alias on Current Key** to retain the key alias with timestamp on the archived key after rotation. The format of the Gravestone alias is `<current alias>-rotated-<timestamp>`. The alias will only be applied to keys with an existing alias.
6. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Adding Key Refresh Schedule

Note

With support for on-demand rotation of both native and imported BYOK keys, the refresh operation now takes longer than in previous releases. This is because detailed rotation information must be synchronized from AWS KMS to CCKM.

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Schedules**. The list of available schedules is displayed.
 3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
 4. Select **Schedule Type** as **Key Refresh**.
-

-
5. Click **Next**.
 6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **AWS** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
 7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **Duration** for the scheduler. Specify the following values:
 - **Schedule Starts**
 - **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.
 - b. Configure **Frequency** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Next**.
 8. On the **Add Accounts** screen:
 - a. Select the account name from the **Refresh Keys from Selected Account(s)** drop-down list.
 - b. Click **+** button.
 - c. Similarly, you can add more accounts.
 - d. Select the **Refresh All Accounts** option if you want to refresh all the existing accounts.
 - e. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Automatic Cloud Key Discovery

A KMS container schedule automatically detects the KMS containers based on the AWS Cloud connection and adds them to the CipherTrust Cloud Key Manager.

Note

When adding a KMS container schedule, select a connection that has access to the management account of your AWS organization. The connection must have permissions to list all organizational units (OUs) and accounts within the organization.

Refer to [configurations to discover all AWS accounts](#) for details.

Adding a KMS container (vault or subscription) to CCKM consumes one CCKM license count.

To add a KMS container schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Select Schedule Type screen of the Add New Schedule wizard is displayed.

Schedule Type

1. Select Schedule Type as **Add KMS Container**.
2. Click **Next**. The General Info screen is displayed.

General Info

1. Enter a unique **Schedule Name**.
2. Select **AWS** from the **Cloud Name** drop-down list.
3. (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
4. (Optional) Select **Enable Schedule** to enable the schedule.
5. Select a job type from **Define Job Type**. The options are:
 - **Discover Only**: Lists all the discovered containers.
 - **Discover and Add**: Adds all the discovered containers to the CCKM.
6. (Optional) Enable **Archive Accounts**.
7. Click **Next**. The Connection screen is displayed.

Connection

1. Select a **Connection**.
2. Enter a **Role**.

3. (Optional) Enter a **AWS Role External ID**.

4. (Optional) Add the Filters.

a. Select a **Name**.

You can select only one of the following names: [Root] Arn, [Root] Id, [Root] Name, [Root] Tag, [OrganizationalUnit] Arn, [OrganizationalUnit] Id, [OrganizationalUnit] Name, [OrganizationalUnit] Tag, [Account] Arn, [Account] Email, [Account] Id, [Account] Name, and [Account] Tag.

b. Enter a **Value**.

c. Click **+** (plus).

Note

- A name can have only one value.
- You can add multiple filters.

5. Click **Next**. The Region & ACLs screen is displayed.

Region & ACLs

1. (Optional) In Select Regions section, add regions to the schedule.

a. Select the desired regions.

b. Click right arrow (). The selected regions move to the **All Selected Regions** list.

2. (Optional) In the ACCESS CONTROL section.

a. Click **Keys**, **Certificates**, **Secrets**, or **Reports** tab.

b. Click the **All Keys**, **BYOK Keys**, **Native Keys**, **HYOK Keys**, **Cloud HSM Keys**, **Custom Key Store**, or **Reports** tab.

c. Click **Assign User/Group**. The Assign User/Group dialog box is displayed.

d. Select the desired user or group from the **User/Group** drop-down list.

e. Click **Save**. The newly added user/group is displayed under **Name** in the ACCESS CONTROL section.

f. Grant the permissions to the user/group, as appropriate.

Granting additional permissions

To grant additional permissions, select the check box under the desired operation corresponding to the

desired users or groups. You can grant the following permissions.

- **All Keys:** Cancel Key Delete, Schedule Key Delete, Delete Material, Import Material, Rotate Key, Refresh Key, and Edit Key.
- **BYOK Keys:** View Key and Add Key.
- **Native Keys:** View Key and Add Key.
- **HYOK Keys:** View Key, Add Key, Block/Unblock, Link Key, and Delete Key.
- **Cloud HSM Keys:** View Key, Add Key, and Delete Key.
- **Custom Key Store:** View, Add, Edit, Delete, Block, Unblock, Connect, Disconnect, and Link.
- **Reports:** View Report, Add Report, Download Report, and Delete Report.

To remove a permission, clear the check box under the desired operation.

g. Remove a user or group.

- a. Under **Unassign**, click **X** corresponding to the desired user/group. The Remove Group dialog box is displayed.
- b. Click **Remove**.

3. Click **Next**. The Schedule Config screen is displayed.

Schedule Config

1. Configure **DURATION** for the scheduler. Specify the schedule start and end time:

- **Schedule Starts:** Specify time when the schedule starts.
- **Schedule Ends:** Unavailable by default, that is, the scheduler never expires.
- **Never:** Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

2. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.

3. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

After the schedule is run successfully, AWS KMS Accounts will be added to the CCKM. You can see them in the Vaults section, of the AWS KMS Accounts page in the CCKM.

Adding Credential Rotation Schedule (AWS XKS only)

A credential rotation schedule auto rotates the selected key store's credentials with new credentials. You can assign a credential rotation schedule for the credentials of a given external custom key store in CCKM. You must first create one or more rotation schedules for the key store's credentials. Thereafter, these schedules are made available within a list under **Schedules** of the details page for the given custom key store, which you can then assign to the key store.

To add credential rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. **Select Schedule Type as Credential Rotation (AWS XKS only).**
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **Duration** for the scheduler. Specify the following values:
 - **Schedule Starts**
 - **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.
 - b. Configure **Frequency** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Save**.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Schedules**. The Schedules page displays following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP, Azure, and AWS only) • Credential Rotation (AWS XKS only)
Cloud Name	Name of the cloud. Note: For the schedule type of Credential Rotation, only the AWS cloud is supported.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Creation time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.
4. Edit or configure the following fields:
- Description.
 - Status of the scheduler configuration.
 - Connection settings, refer to [Connection](#) for details.
 - (Applicable to KMS container schedule) Regions and Access Control settings. Refer to [Region & ACLs](#) for details.
 - Scheduler configuration parameters, such as duration and frequency. Refer to [Schedule Config](#) for details on key rotation schedule fields.
5. Click **Update** to save the changes.

JOB HISTORY

The Schedules page also contains a section named JOB HISTORY. Every time a schedule is run, a Job is created.

-
- This section displays information related to a job such as **Run Date**, **Job ID**, and **Status**.
 - To view the details of the job, click the **Job ID** link corresponding to the desired job. The Job details page is displayed. It shows the list of AWS Accounts along with their Health and Status.
 - The health can be:
 - **Error**: Failed to manage the KMS accounts.
 - **Warning**: KMS accounts managed partially.
 - **Healthy**: Successfully managed all the KMS accounts.
 - The status can be:
 - **FailedToAccess**: KMS account can't fetch AWS regions because it doesn't have access to regions.
 - **AlreadyManaged**: Regions are already managed by a KMS container within the KMS account.
 - **NewlyManaged**: Regions are newly managed by a KMS container within the KMS account.
 - **FailedToManage**: Regions couldn't be managed by a KMS container within the KMS account.
 - **NotManaged**: None of the regions is managed by a KMS container within the KMS account.
 - **Archived**: All regions are archived by a KMS container within the KMS account.

Note

- You can view the details of successfully completed jobs that belong to a KMS container schedule.

- To download the reports of AWS Accounts, go to the top left of the Job details page, click **Download**, and select an **AWS Accounts** from the drop-down menu.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Managing AWS Reports

CCKM provides options to generate key visibility reports based on:

- Key-related activities between CCKM and AWS KMS
- Track keys by their expiration dates

- What applications are using the keys

AWS reports are categorized as:

- **Key Activity Report:** Inspect individual AWS key histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and AWS KMS.
- **Key Aging Report:** Track keys by their expiration dates. Audit a range of dates, from past material deletions to future scheduled deletions, within the selected AWS KMS account.
- **Service/Usage Report:** Monitor key usage by tracking services and applications consuming the keys. View when and where a service requests the use of each key.

Prerequisites

For generating CCKM reports, logs are fetched from AWS using the CloudTrail and CloudWatch services. You need to configure these services on the **AWS console**. This includes specifying trail name, storage location, log group name, IAM role, and event types.

Attach the following policy to the IAM role linked with the log group:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "logs:DescribeLogGroups",
        "logs:FilterLogEvents"
      ],
      "Effect": "Allow",
      "Resource": "*"
    }
  ]
}
```

Creating AWS Reports

CCKM users with the **Add Report** permission can create reports.

To create an AWS report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > AWS**. The AWS Reports page is displayed.
3. Click **Add Report**. The Choose Report Type and Name screen of the Add AWS Report wizard is displayed.
4. Under Select Report Type, select a report type. The options are:
 - Key Activity Report

- Key Aging Report
- Service/Usage Report

- Specify a **Report Name**. This is a mandatory field.
- Click **Next**. The Select Log groups screen of the wizard is displayed.
- Select an **AWS KMS** from the drop-down list.
- (Not applicable to Key Aging Report)* Select a **Log Region** from the drop-down list. The drop-down list shows the log regions of the selected AWS KMS account.

When a log region is selected, its log groups (if any) are populated in the Log Group Name drop-down list.

- (Not applicable to Key Aging Report)* Select a **Log Group Name** from the drop-down list.
- Click **Add**. The selected log group is displayed under Selected Log Groups. Add more log groups, if required.
- Click **Next**. The Set Start and End Dates screen of the wizard is displayed.
- In the **Include Entries From** field, specify the start date and time for the report.
 - Click the field and select the date and time on the on-screen calendar.
 - Alternatively, enter the time in **MM/DD/YYYYHH:MM** format.
- In the **To** field, specify the end date and time for the report.
- Click **Save**.

A success message **Created report** is displayed. The newly created report is displayed under the AWS reports list.

Viewing AWS Reports

CCKM users with the **View Report** permission can view reports.

The AWS Reports page displays the list of existing reports. Filter the reports by their names.

To view existing AWS reports:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Reports > AWS**. The list of available reports is displayed. The following details of the reports are displayed:

Column Name	Description
Report Name	Name of the report.

Column Name	Description
Run Date	When the report is run.
Type	Type of the report. The type can be: • Key Activity Report • Key Aging Report • Service/Usage Report
Start Date	Start date from when the report is generated. If a report is run now, its status becomes Running Now.
End Date	End date for the report.

Viewing Details of an AWS Report

CCKM users with the **View Report** permission can view reports.

To view the details of an AWS report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > AWS**. The list of available reports is displayed.
3. Click the desired **Report Name** link. The details of report are displayed.

Alternatively, click the overflow icon () corresponding to the desired alias and click **View**.

Downloading AWS Reports

CCKM users with the **Download Report** permission can download reports.

To download an AWS report as a CSV file:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > AWS**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Download**.

Alternatively, click the desired report under **Report Name**, and click **Download CSV** in the detail view.

The report is downloaded as a CSV file.

Deleting AWS Reports

CCKM users with the **Delete Report** permission can delete reports.

To delete an AWS report:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Reports** > **AWS**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Delete**. The Confirm Delete Report message is displayed.
4. Click **Delete Report**.

The report is removed from the list of reports.

Managing Policies

Policies can be applied to new AWS keys during and after creation. Saved policies (policy templates) are supported for all Native, BYOK, and CloudHSM keys.

For HYOK keys, policy templates are applicable to linked keys only.

Note

- Consult the [AWS Key Management Service Developer Guide](#) for details on the effects of AWS key policies.
- The `ListResourceTags`, `TagResource`, and `UntagResource` permissions are needed to manage saved policies.

This section covers the following topics:

- [Creating New Policies](#)
- [Viewing Saved Policies](#)
- [Viewing Details of Saved Policies](#)
- [Updating Saved Policies](#)
- [Deleting Saved Policies](#)

Creating New Policies

You must have the **Add Key** (BYOK, HYOK, or Native) or **CloudHSM - Add Key** permission to create a policy.

To create a policy:

1. Open the **Cloud Key Manager** application. By default, the AWS Keys tab is selected.
2. Click the **Saved Policies** tab.
3. Click **Create Policy**. The Select Account and Name Policy screen is displayed.

Select Account and Name Policy

1. Specify a unique policy **Name**.
2. Select the **AWS KMS Account**. The policy will be added to this account.
3. (Optional) Enable **Create Policy at Account ID Level**.

Note

You can create the policy with a KMS Account or Account ID.

4. Click **Next**. The Configure Policy screen is displayed.

Configure Policy

Select the key admins, key users, and additional accounts for the policy. The **Key Admins** and **Key Users** tabs display the list of available AWS users and roles.

You can configure policy in either the Basic view or Raw view. The default view is Basic.

In the Basic view, Key Admins is the default tab.

1. On the **Key Admins** tab, select the desired key admins.
2. Click the **Key Users** tab.
3. Select the desired key users.
4. Add external accounts in the **Add Accounts** field and click **+**.

These accounts have user permissions. Similarly, you can add more external accounts. To remove an account, click the close (X) icon in the account name.

To switch to the Raw view, click **Switch to policy (Raw) View**. In the Raw view, paste a policy in JSON format in the **Raw Policy** field.

Note

Any edits made in the policy (Raw) view will be retained exclusively in the policy (Raw) view.

5. Click **Next**. The Review and Add screen is displayed.

Review and Add

Before adding the policy, review all the details. After the policy is added, certain features cannot be edited.

1. Review the policy and account details. If the details are incorrect or you want to modify them, click **Back** and update the details.
2. Click **Add Policy**.

The newly created policy appears on the Saved Policies tab. The status of the policy is Unverified.

Viewing Saved Policies

The Saved Policies tab of the AWS Keys page shows the list of existing key policies. Filter the policies by Policy Name, Account Name, or Account ID.

You must have the **View Key** (BYOK, HYOK, or Native) / **CloudHSM - View Key** permission to view policies.

To view the saved policies:

1. Open the **Cloud Key Manager** application. By default, the AWS Keys tab is selected.
2. Click the **Saved Policies** tab. The list of available policies is displayed. The tab shows the following details:

Column Name	Description
Policy Name	Name of the policy.
Status	Status of the policy - Verified or Unverified. If a policy is linked with an AWS key, its status is Verified, otherwise, the status is Unverified.
Account Name	Name of the AWS KMS account.
Account ID	ID of the AWS KMS account.
Cloud	Name of the AWS cloud - AWS, AWS Gov Cloud, or AWS China.
Creation Date	Time when the policy is created.

Viewing Details of Saved Policies

The detail view of a policy shows the associated keys and the policy.

You must have the **View Key** (BYOK, HYOK, or Native) / **CloudHSM - View Key** permission to view the policies.

To view the details of a policy:

1. Open the **Cloud Key Manager** application.
2. Click the **Saved Policies** tab. The list of available policies is displayed.
3. Click the **Policy Name** link of the desired policy.

Alternatively, click the overflow icon () corresponding to the desired policy and click **View Details**.

The detail view shows the details of the associated keys and the policy under KEYS and POLICY sections.

Updating Saved Policies

You must have the **Edit Key** (BYOK, HYOK, or Native) or **CloudHSM - Add Key** permission to create a policy.

To update saved policies:

1. Open the **Cloud Key Manager** application.
2. Click the **Saved Policies** tab. The list of available policies is displayed.
3. Click the overflow icon () corresponding to the desired Saved Policy and click **View Details**.

Alternatively, click the saved policy link under the Policy Name field to view the Saved Policy details.

4. Scroll down to the POLICY section, and select the view to update the policy, the options are **Raw View** and **Basic View**.
5. Click the desired tab to view the instructions.

Raw View

Make the necessary changes in the policy.

Basic View

In the Basic View, Key Admins is the default tab.

- a. On the **Key Admins** tab, select the desired key admins.
- b. Click the **Key Users** tab.
- c. Select the desired key users.

Note

If you make changes in one of the views and switch to the other view without updating the policy, you will see a **Warning** message. Click **Yes** to continue.

6. Click **Update**. The **Update Policy** message is displayed.

Note

To save the changes as a new policy, select the **DO NOT Push Changes** check box, and enter **New Policy**.

-
7. Click **Apply**.

Deleting Saved Policies

You must have the **Schedule Key Delete**, **Delete Key (HYOK)**, or **CloudHSM - Delete Key** permission to delete a policy.

Only the policies with the status **Unverified** can be deleted. If a policy is associated with (or being used by) an AWS key, it cannot be deleted. So, before deleting a policy, make sure that is not associated with any AWS key.

To delete a policy:

1. Open the **Cloud Key Manager** application. By default, the **AWS Keys** tab is selected.
2. Click the **Saved Policies** tab.
3. Click the overflow icon () corresponding to the desired policy.
4. Click **Delete Policy**. A message box appears prompting to confirm the policy deletion.

Deleting a policy is permanent and cannot be undone. After deletion, the policy cannot be retrieved.

5. Click **Delete Policy**. The policy is deleted.

Managing AWS Templates

The templates store and manage AWS policy templates (in JSON format) to be used as a base for creating key policies.

This section covers the following topics:

- [Creating Templates](#)
- [Viewing Templates](#)
- [Updating Templates](#)
- [Deleting Templates](#)

Creating Templates

You must have the **Add Key** permission to create a template.

To create a template:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. By default, the **Keys** tab is selected.
3. Click the **Templates** tab.

4. Click **Create Template**. The Create Template wizard is displayed.
5. Enter **Name**.
6. Enter **JSON**.
7. Click **Save**.

A success message is displayed on the screen.

Viewing Templates

To view the templates:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. By default, the Keys tab is selected.
3. Click the **Templates** tab. The list of available templates is displayed. The tab shows the following details:

Column Name	Description
Template Name	Name of the template.
Creation Date	Time when the template is created.

Updating Templates

You must have the **Edit Key** permission to update a template.

To update the templates:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > AWS**. By default, the Keys tab is selected.
3. Click the **Templates** tab. The list of available templates is displayed.
4. Click the **Template Name** link of the desired template. The View/Edit Template wizard is displayed.
5. Update the **JSON** details.
6. Click **Update**.

A success message is displayed on the screen.

Deleting Templates

You must have the **Schedule Key Deletion** permission to delete a template.

To delete a template:

-
1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Cloud Keys > AWS**. By default, the Keys tab is selected.
 3. Click the **Templates** tab. The list of available templates is displayed.
 4. Click **Delete Template** corresponding to the desired template. The Delete Template dialog box is displayed.

Deleting a template is permanent and cannot be undone. Keys using this template will not be affected. Are you sure you want to delete this template?

5. Click **Delete Template**.

A success message is displayed on the screen.

Migrating to IAM Roles Anywhere Connections

To migrate from an access key and secrets-based connection to an IAM Roles Anywhere-based connection:

1. Upgrade to the CipherTrust Manager to the latest version. Refer to [System Upgrade/Downgrade](#) for details.
2. On the CipherTrust Manager, create an AWS connection with IAM Roles Anywhere enabled. Refer to the following sections for details:
 - a. [Prerequisites](#)
 - b. [Additional Configuration for AWS IAM Roles Anywhere](#)
 - c. [Connection Manager](#)
3. Open the **Cloud Key Manager** application.
4. In the left pane, click **KMS Containers > AWS KMS Accounts**.
5. Update the desired AWS KMS account with the AWS IAM Roles based connection (created above).
6. Verify that all the KMS operations are working as expected.

Downloading AWS Metadata

Downloading AWS Keys Metadata

CCKM users with permissions to view the AWS keys can export and download the keys metadata displayed on the CCKM GUI. Filter the keys metadata to display on the GUI based on your requirements, for example, all keys created in the past 12 months, all keys residing in a specific AWS account, and all keys based on a specific algorithm. You can then download the filtered metadata as a CSV file.

To download the AWS keys metadata visible:

1. Open the **Cloud Key Manager** application.
-

2. In the left pane, click **Cloud Keys > AWS**. The AWS Keys tab of the AWS Keys page is displayed.
3. Filter the keys metadata based on your requirements.

Use the Search box to filter the keys. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The filtered AWS keys metadata is downloaded as a CSV file.

Downloading AWS KMS Accounts Metadata

CCKM users with permissions to view the KMS accounts can export and download the accounts metadata displayed on the CCKM GUI. Filter the KMS accounts metadata to display on the GUI based on your requirements. You can then download the filtered metadata as a CSV file.

Metadata of a maximum of 100 KMS accounts can be exported and downloaded.

To download the AWS KMS accounts metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Filter the accounts metadata based on your requirements.

Use the Search box to filter the KMS accounts. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The filtered AWS KMS accounts metadata is downloaded as a CSV file.

AWS CloudHSM Key Store Resources

Within AWS CloudHSMs, AWS provides cloud-based hardware security modules (HSMs), which are used to perform cryptographic operations and store cryptographic keys securely. Using an AWS CloudHSM, you can create and control your encryption keys within the AWS Cloud. The HSMs reside in a cluster of HSMs, which are automatically synchronized whenever an operation is performed on one. You own and manage these HSMs as a single-tenant user of the device, which you run on your own AWS Virtual Private Cloud (VPC).

In this documentation, AWS CloudHSM is also referred to as AWS CloudHSM key store.

CCKM integration with AWS CloudHSM enables you to perform the following from the CCKM UI:

- Create and manage CloudHSM key stores
- Connect to a CloudHSM key store
- Create and manage CloudHSM keys

Prerequisites for AWS CloudHSM

Prior to creating an AWS CloudHSM key store from CCKM, ensure to perform the prerequisite steps within AWS. For more information, refer to AWS CloudHSM documentation including the *AWS Key Management Service Developer Guide* and *AWS CloudHSM User Guide*.

Setting up a CloudHSM Key Store from CCKM

After you have performed the prerequisite steps including creating an AWS CloudHSM cluster, proceed to CCKM to create a CloudHSM key store and then connect it to the cluster you wish to use for this key store.

To set up a CloudHSM key store:

1. From CCKM, create a key store of type CloudHSM. See [Create a CloudHSM Key Store](#).
2. From CCKM, connect your CloudHSM key store to its associated AWS CloudHSM cluster. See [Connect to a CloudHSM Key Store](#).

Managing an AWS CloudHSM Key Store from CCKM

This section describes how to perform the following steps from CCKM:

- [Create a CloudHSM Key Store](#)
- [View and Edit Details of a CloudHSM Key Store](#)
- [Delete a CloudHSM Key Store](#)
- [Connect to a CloudHSM Key Store](#)
- [Disconnect a CloudHSM Key Store](#)

Create a CloudHSM Key Store

From CCKM, you have the ability to create an AWS CloudHSM key store within AWS Cloud. After the store is created, you can proceed to creating your CloudHSM keys within the key store from CCKM. For information, see [Creating CloudHSM Keys](#).

Note

A newly created key store will be in a disconnected state.

Note

You can only use an unused AWS CloudHSM cluster to create an AWS CloudHSM key store. For more

information, refer to AWS CloudHSM documentation.

Note

Ensure to download the trust anchor certificate of the AWS CloudHSM prior to creating a CloudHSM key store and save it to a secure location. For more information, refer to the *AWS CloudHSM User Guide*.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that will own the key store. The account details page is displayed.
4. Under **CloudHSM Key Stores**, click the **+ Add CloudHSM Key Store** button. You might have to expand the **CloudHSM Key Stores** section to view the button. The **Add CloudHSM Key Store** screen displays.
5. In the **Add CloudHSM Key Store** screen, provide the following settings:
6. Select the **Region** in which the store will reside.
7. Enter the **Key Store Name** using a friendly name for the key store.
8. Select the **AWS CloudHSM Cluster** from the drop-down list to which to associate with the key store.

Note

Only *unused* CloudHSM clusters display in the drop-down list.

9. Click **Choose File**, select the trust anchor certificate file of the AWS CloudHSM cluster. This certificate file was created during the initialization of the cluster. AWS KMS will use the trust anchor certificate to connect the key store to the cluster. For more information, refer to the *AWS CloudHSM User Guide*.
10. Enter the **Password** of the `kmsuser` crypto user (CU) account. When AWS KMS logs into the cluster, it uses this user to manage key material on your behalf.
11. Click **Save**

The new CloudHSM key store is displayed under **CloudHSM Key Stores**.

View and Edit Details of a CloudHSM Key Store

You have the option to edit the key store name, AWS CloudHSM cluster, and password of an existing CloudHSM key store.

Note

A CloudHSM key store must be in a disconnected state before you can edit its key store name, associated cluster, or password. **Be sure to disconnect the key store from the associated CloudHSM cluster before editing the key store.**

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **CloudHSM Key Stores**, find the desired CloudHSM key store name.
5. From the **CloudHSM Key Stores** display, click the ellipsis icon associated with the desired CloudHSM key store.
6. Click **View/Edit Details**. The **General Info** section of the view/edit details page displays.
7. (Optional) Enter the new key store name in **Key Store Name**, if you wish to use a different name.
8. (Optional) Select another **AWS CloudHSM Cluster** to which to associate with the key store from the drop-down list, if you wish to use a different cluster.
9. (Optional) Enter your new **Password** of the `kmsuser` CU account, if you wish to change this password.
10. Click **Update**.

Delete a CloudHSM Key Store

Before proceeding to delete a key store, be sure to delete all of the CloudHSM keys within it. You will have schedule to delete the keys. For more information, see [Schedule Deletion of a Key](#). Thereafter, disconnect the key store from its associated AWS CloudHSM cluster. You can then proceed to deleting the key store after disconnecting the key store.

Warning

Deleting a CloudHSM key store is a irreversible operation, which permanently deletes the store from the AWS Cloud.

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **CloudHSM Key Stores**, find the desired CloudHSM key store name.
5. From the **CloudHSM Key Stores** display, click the ellipsis icon associated with the desired CloudHSM key store.
6. Click **Delete Store**.
7. You are prompted to confirm the deletion. Enable the **I wish to delete this Key Store** checkbox and click **Delete**.

Connect to a CloudHSM Key Store

A newly created key store will be in a disconnected state. Connect the key store to the AWS CloudHSM cluster you wish to use for the store *before* creating keys within your key store.

Note

After a successful connection between a key store and a CloudHSM cluster, AWS KMS changes the password of the **kmsuser** CU account (associated with the key store) for security reasons. **Before** attempting to connect again, reset this password.

Note

Ensure that the **kmsuser** CU is not be logged into the key store's associated AWS CloudHSM cluster. Otherwise, the AWS KMS is prevented from logging into the account in which the store is added.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **CloudHSM Key Stores**, find the desired CloudHSM key store name.
5. From the **CloudHSM Key Stores** display, click the ellipsis icon associated with the desired CloudHSM key store.
6. Click **Connect**. The Connect Key Store page displays.
7. You are prompted to confirm that you wish to connect to the key store. Enter the password to use to connect to the key store and then click **Connect**. This is the password for the **kmsuser** CU account, which you

entered when you created the CloudHSM key store.

Disconnect a CloudHSM Key Store

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **CloudHSM Key Stores**, find the desired CloudHSM key store name.
5. From the **CloudHSM Key Stores** display, click the ellipsis icon associated with the desired CloudHSM key store.
6. Click **Disconnect**. The Disconnect Key Store page displays.
7. You are prompted to confirm that you wish to disconnect the key store. Click **Disconnect**.

AWS External Key Store Resources

External Key Store (XKS) resources for integration with Amazon Web Services Key Management Service (AWS KMS) allow you to manage keys held in Luna Network HSMs (Hardware Security Module) or a CipherTrust Manager, and allows AWS KMS to use the keys for cryptographic operations on demand.

The external custom key store entity on CipherTrust Cloud Key Manager (CCKM) provides access to AWS KMS to use source key material stored in HSM partitions or a CipherTrust Manager, while preserving end user control to manage those source keys outside of AWS KMS.

The external custom key store contains Hold Your Own Key (HYOK) keys, which acts as an intermediary to the source key material stored in Luna HSM or CipherTrust Manager. Luna or CipherTrust Manager (depending on which key source you are using) executes the cryptographic operations.

External custom key stores and HYOK keys on CCKM can be created as linked or unlinked to an external key store in AWS KMS. Linked key stores and keys automatically synchronize with objects in AWS KMS, and unlinked key stores do not. Unlinked key stores and HYOK keys require you to either link those objects, which automatically creates corresponding external key stores and KMS keys on AWS KMS, or to manually create corresponding objects in AWS KMS.

Required Resources

- If using a Luna HSM as a key source, then ensure to have at least one [Thales Luna Network HSM \(v7.4 or higher\)](#), with at least one initialized network trust link (NTLS) or Secure Trusted Channel (STC) partition. Preferably, you should have two HSMs for redundancy. When you connect multiple Luna Network HSM partitions to CipherTrust Manager, the partitions automatically become HA (High Availability) enabled and replicate keys to each other.

Warning

HSMs configured for Functionality Modules (FMs) are not compatible with this integration.

- An AWS Account.

Suggested Deployment Architectures

We recommend deploying at least two CipherTrust Managers in [cluster](#) to provide proper redundancy and availability to AWS KMS. All XKS resources and configurations are replicated across all nodes. If using Luna HSM as a key source, then we recommend connecting two or more Luna Network HSM partitions for redundancy. When you connect multiple partitions, they automatically become HA enabled and replicate keys to each other.

If using Luna HSM as a key source, you must establish connections with the CipherTrust Manager instances and the AWS account that manages corresponding KMS keys and external key stores, as described in [Managing External Key Store Resources](#).

If using CipherTrust Manager as a key source, you must establish connections between the CipherTrust Manager instances and the AWS account.

Deployment topologies vary based on usage of AWS Virtual Private Cloud (VPC). The following are the supported deployment topologies:

- Host the CipherTrust Manager instances on a VPC
- Host the CipherTrust Manager instances on premises with a VPC connection
- Host the CipherTrust Manager instances on premises and make them public routable and available over the Internet

In these topologies, the key source is either Luna HSM or CipherTrust Manager. When using Luna HSMs, these are deployed on premises.

Deployment Prerequisites

- The CipherTrust Manager must be reachable through a Fully Qualified Domain Name (FQDN).
 - In VPC deployments, you provide this value to set the **Private DNS Name** in the VPC endpoint service. If you are operating an unlinked key store and manually creating an external key store on AWS KMS, you also provide this value as the **Proxy URI endpoint**.
 - You provide this as the **Proxy URI endpoint** for public routable deployments without a load balancer.
- You can change the default port of 443 for the CipherTrust Manager web interface. One would have to ensure to change it **BEFORE** configuring the given cloud service on CCKM. However, in the case of AWS XKS, AWS KMS only accepts and sends requests on the default port of 443. If you wish to use a different port for the web interface other than the default, add a network component, such as a load balancer or a firewall, in front of CipherTrust Manager. Then configure port mapping on this component by mapping port 443 to the non-default

port on the CipherTrust Manager you plan to use. For more information, refer to [Support for Changing the Default Port of Web Interface Setting](#).

- The web interface must have a [TLS certificate signed by an external Certificate Authority \(CA\)](#) trusted by AWS. AWS trusts certificates issued by well-known public CAs such as Verisign.
- The Common Name (CN) in the web interface certificate must be set to a specific value.
 - A good default value for the CN is the CipherTrust Manager FQDN.
 - For VPC deployments with more than one AWS KMS external key store, the CN should include the wildcard * asterisk character.
 - If you are using a load balancer with a publicly routable deployment, and the load balancer is set to do SSL passthrough, include the wildcard * asterisk character in the CN.
- We recommend setting up all networking elements before creating the external custom key store on CCKM. This is especially important when you create an external custom key store in the linked state. Successful validation of the connection between AWS KMS and the new external custom key store must take place before a linked key store can be created. For example, for [CipherTrust Manager hosted on premise with VPC connection](#), configure VPC endpoints as described in AWS documentation, before creating the external custom key store on CCKM.
- The Health Check Key must be created before creating a key store.

Depending on the location of the key store, the health check is initiated.

- If the key store is on Luna HSM, the Health Check Key must have the following attributes:
 - `CKA_EXTRACTABLE = FALSE`
 - `CKA_SENSITIVE = TRUE`
 - `CKA_ENCRYPT = TRUE`
 - `CKA_DECRYPT = TRUE`
 - `CKA_WRAP = TRUE`
 - `CKA_UNWRAP = TRUE`
- If the key store is on CipherTrust Manager, the Health Check Key must have the following attributes:
 - `Key Not Exportable`
 - `Key Not Deletable`
 - `Usage Masks - Encrypt, Decrypt, Wrap, Unwrap`

CipherTrust Manager Hosted on VPC

CipherTrust Manager deployment inside a VPC is described in the [Amazon Web Services deployment page](#). Detailed VPC configuration, such as availability zones, is described in [AWS Key Management Service Deployment Guide](#).

CipherTrust Manager Hosted on VPC Using Luna HSM as a Key Source

CipherTrust Manager Hosted on VPC Using CipherTrust Manager as a Key Source

CipherTrust Manager Hosted on Premise with VPC Connection

Configuration of VPC endpoints is described in [AWS Key Management Service Deployment Guide](#).

CipherTrust Manager Hosted on Premise Using Luna HSM as a Key Source

CipherTrust Manager Hosted on Premise Using CipherTrust Manager as a Key Source

CipherTrust Manager on Premise with Public Routable Connection

CipherTrust Manager on Premise with Public Routable Connection Using Luna HSM as a Key Source

CipherTrust Manager on Premise with Public Routable Connection Using CipherTrust Manager as a Key Source

Network Considerations for Optimal Stability and Performance

There are some important network considerations for deployments of an external key store.

- AWS KMS, Luna HSM appliances (if using Luna HSMs as a key source), and CipherTrust Manager instances should all be as geographically close together as possible. The supported AWS regions are described in [AWS Key Management Service Deployment Guide](#).
- When Luna HSM is the key source, we recommend a network latency of round-trip communication of 25 ms or less between CipherTrust Manager and the HSM.
- When CipherTrust Manager is the key source, we recommend a network latency of round-trip communication of 35 ms or less between AWS KMS and the CipherTrust Manager.
- We recommend preparing only one or two external key stores per deployment.
- For a summary of AWS XKS performance, refer to [AWS XKS Performance Summary](#).

High Level Integration Process Using Luna HSM as a Key Source

These are the high level steps to allow AWS KMS to begin making cryptographic requests to source keys through external custom key stores within CCKM. Unlinked external custom key stores and HYOK keys require additional steps.

1. Deploy two CipherTrust Manager instances in keeping with the [deployment prerequisites](#). Cluster the instances together.

-
2. Deploy one or more Luna Network HSM partitions with initialized NTLS or STC partitions, as described in [Luna Network HSM documentation](#). Preferably, you would have two HSM servers with at least one partition each.
 3. If needed for a VPC connection, configure VPC endpoints as described in the [AWS Key Management Service Developer Guide](#).
 4. Prepare an External Custom Key Store.

As part of this process, you establish CipherTrust Manager connections to Luna HSM partitions and to the AWS account, and create an external custom key store on CCKM.

5. If you created an unlinked key store on CCKM, you must either link the key store or create a corresponding external key store on AWS KMS as described in [AWS Key Management Service Deployment Guide](#).
6. Create an AWS HYOK key.
 - In the CipherTrust Manager web console for [AWS keys](#), you create a Hold Your Own Key (HYOK) key. An associated backing Luna HSM source key is implicitly created.
 - In the CipherTrust Manager [REST API](#), you create a Luna HSM source key, provide its value to create a virtual key, and then create an HYOK key associated with the virtual key.
7. If you have created an unlinked HYOK key on CCKM, either link the key or create a KMS key in the AWS external key store, associated with the the HYOK key on CCKM.

High Level Integration Process Using CipherTrust Manager as a Key Source

These are the high level steps to allow AWS KMS to begin making cryptographic requests to CipherTrust Manager source keys through external custom key stores within CCKM. Unlinked external custom key stores and HYOK keys require additional steps.

1. Deploy two CipherTrust Manager instances in keeping with the [deployment prerequisites](#). Cluster the [instances](#) together.
2. If needed for a VPC connection, configure VPC endpoints as described in the [AWS Key Management Service Developer Guide](#).
3. Prepare an External Custom Key Store.

As part of this process, you establish a CipherTrust Manager connection to the AWS account and create an external custom key store on CCKM.

4. If you created an unlinked key store on CCKM, you must either link the key store or create a corresponding external key store on AWS KMS, as described in [AWS Key Management Service Deployment Guide](#).
5. Create an AWS External Custom Key Store on CCKM.

6. If you have created an unlinked HYOK key on CCKM, either link the key or create a KMS key in the AWS external key store, associated with the the HYOK key on CCKM.

AWS and CCKM Terminology

Terms used in AWS documentation, API, or AWS Console can differ from terms used in CCKM documentation, CipherTrust Manager REST API, and CipherTrust Manager web console for the same concepts. The following table provides equivalencies.

AWS term(s)	CCKM term(s)	Notes
External key	Luna HSM source key or CipherTrust Manager source key	Generally refers to the key material which performs cryptographic operations.
External Key ID, XksKeyId	XKS ID, XksKeyConfiguration:Id, HYOK ID	This is the key identifier which AWS KMS specifies in cryptographic requests. Important Note: This XKS ID is associated with the HYOK. It is not the source CipherTrust Manager or Luna HSM key's ID.
External Key Store	External Custom Key Store, Custom Key Store	CCKM documentation refers to the CCKM object as external custom key store and the AWS object as external key store . Product interfaces may use these terms interchangeably.
Proxy URI endpoint	XKS Proxy URI Endpoint	This value is the hostname of the server entity which AWS KMS first connects to for cryptographic requests. In VPC deployments, this is the Private DNS Name set for the VPC endpoint service. In non-VPC deployments, this is usually a load balancer.
Proxy URI Path	XKS Proxy URI Path	This is the path associated with an external custom key store in CCKM.
XKS proxy configuration file	Credentials file	The downloadable file available in CCKM when you create a new external custom key store or rotate the credentials for an external custom key store. This file contains the external custom key store's Proxy URI path prefix , Access key ID , and Secret access key values.

Managing External Key Store Resources

Deployment Prerequisites

- The CipherTrust Manager must be reachable through a Fully Qualified Domain Name (FQDN).
 - In VPC deployments, you provide this value to set the **Private DNS Name** in the VPC endpoint service. If you are operating an unlinked key store and manually creating an external key store on AWS KMS, you also provide this value as the **Proxy URI endpoint**.
 - You provide this as the **Proxy URI endpoint** for public routable deployments without a load balancer.
- You can change the default port of 443 for the CipherTrust Manager web interface. One would have to ensure to change it **BEFORE** configuring the given cloud service on CCKM. However, in the case of AWS XKS, AWS KMS only accepts and sends requests on the default port of 443. If you wish to use a different port for the web interface other than the default, add a network component, such as a load balancer or a firewall, in front of CipherTrust Manager. Then configure port mapping on this component by mapping port 443 to the non-default port on the CipherTrust Manager you plan to use. For more information, refer to [Support for Changing the Default Port of Web Interface Setting](#).
- The web interface must have a **TLS certificate signed by an external Certificate Authority (CA)** trusted by AWS. AWS trusts certificates issued by well-known public CAs such as Verisign.
- The Common Name (CN) in the web interface certificate must be set to a specific value.
 - A good default value for the CN is the CipherTrust Manager FQDN.
 - For VPC deployments with more than one AWS KMS external key store, the CN should include the wildcard ***** asterisk character.
 - If you are using a load balancer with a publicly routable deployment, and the load balancer is set to do SSL passthrough, include the wildcard ***** asterisk character in the CN.
- We recommend setting up all networking elements before creating the external custom key store on CCKM. This is especially important when you create an external custom key store in the linked state. Successful validation of the connection between AWS KMS and the new external custom key store must take place before a linked key store can be created. For example, for [CipherTrust Manager hosted on premise with VPC connection](#), configure VPC endpoints as described in AWS documentation, before creating the external custom key store on CCKM.

- The Health Check Key must be created before creating a key store.

Depending on the location of the key store, the health check is initiated.

- If the key store is on Luna HSM, the Health Check Key must have the following attributes:
 - **CKA_EXTRACTABLE = FALSE**

-
- `CKA_SENSITIVE = TRUE`
 - `CKA_ENCRYPT = TRUE`
 - `CKA_DECRYPT = TRUE`
 - `CKA_WRAP = TRUE`
 - `CKA_UNWRAP = TRUE`
 - If the key store is on CipherTrust Manager, the Health Check Key must have the following attributes:
 - `Key Not Exportable`
 - `Key Not Deletable`
 - Usage Masks - Encrypt, Decrypt, Wrap, Unwrap

Permissions to Manage External Custom Key Stores

By default, users in the [CCKM Admins group](#) can manage external custom key stores. This group includes the root `admin` account on CipherTrust Manager.

CCKM administrators can grant users assigned to the [CCKM users group](#) permission to manage external custom key stores. CCKM manages these permissions through the [Access Control List](#) associated with the [AWS KMS account](#).

Linked and Unlinked States

External custom key stores are created in either a **Linked** or **Unlinked** state.

When you create a linked key store on CCKM, a corresponding external key store is automatically created on AWS KMS.

After you create an unlinked key store on CCKM, you must either link it to automatically create a corresponding key store on AWS KMS, or you must manually create the key store on AWS KMS.

If you manually create an external key store on AWS KMS, you can later detect and link it to a CCKM local external custom key store by [refreshing external custom key stores](#), or [refreshing AWS keys](#).

While an external custom key store is unlinked, some operations to later update an unlinked external custom key store require manual configuration on AWS. These update operations include:

- [Creating Keys](#)
- [Rotating Credentials](#)

Prepare an External Custom Key Store

Before you create an external custom key store, decide whether it will be [linked](#) or [unlinked](#).

To prepare an external custom key store and provide access to AWS KMS, you follow the following stages in

order:

1. If using CipherTrust Manager as a key source, [establish an AWS Connection](#). If using Luna HSM as a key source, [establish both AWS and Luna HSM Connections](#).
2. [Create an External Custom Key Store on CCKM](#).
3. Set up the corresponding AWS KMS external key store to communicate with the new CCKM external custom key store. Steps depend on whether the external custom key store is linked or unlinked.
 - **Linked key stores:** [Connect the new external key store](#).
 - **Unlinked key stores:** [Create the Corresponding Key Store on AWS KMS](#).
4. [Create Keys for the External Custom Key Store](#).

The configuration and new objects you create on CCKM, connections to AWS and Luna HSM or CipherTrust Manager, AWS account information, the external custom key store, and AWS keys are replicated across a cluster. For multiple CipherTrust Managers in [cluster](#), you need to only perform this configuration on one node.

Establishing an AWS Connection

If you are using CipherTrust Manager as a key source, be sure to establish a connection between AWS and CipherTrust Manager for HYOK integrations.

1. [Establish an AWS connection](#).

Note

If your CipherTrust Manager is deployed inside a VPC, and the AWS account is in a region other than `us-east-1`, there is an AWS STS Regional Endpoints setting required.

2. Test the connection by finding the new **AWS** connection in the **Connections Table**, clicking the ellipsis button in the row, and selecting **Test Connection**.

A **Ready** status indicates that the connection is working correctly.

3. Add an AWS account, as described in [Managing AWS Accounts](#).

Caution

When you select regions, make sure they are compatible for external key stores. Compatible regions are described in [AWS Key Management Service Deployment Guide](#).

Tip

CCKM Admins can allow CCKM users to manage external custom key stores through the Access Control List associated with the AWS account.

Establishing AWS and Luna HSM Connections

If you are using Luna HSM as a key source, be sure to establish AWS and Luna HSM connections for HYOK integrations.

The [Connection Manager](#) page gives more details about managing the AWS and Luna HSM connections.

1. Establish an AWS connection.

Note

If your CipherTrust Manager is deployed inside a VPC, and the AWS account is in a region other than `us-east-1`, there is an AWS STS Regional Endpoints setting required.

2. Test the connection by finding the new **AWS** connection in the **Connections Table**, clicking the ellipsis button in the row, and selecting **Test Connection**.

A **Ready** status indicates that the connection is working correctly.

3. Add a HSM Server connection and a Luna Network HSM Connection to establish access to a Luna Network HSM partition.
4. Add another HSM server connection and Luna Network HSM connection to add a partition from a second Luna Network HSM.
5. Test the HSM connections in the **Connections Table**, clicking the ellipsis button in the row, and selecting **Test Connection**.

A **Ready** status indicates that the connection is working correctly.

6. Add an AWS account, as described in [Managing AWS Accounts](#).

Caution

When you select regions, make sure they are compatible for external key stores. Compatible regions

are described in [AWS Key Management Service Deployment Guide](#).

Tip

CCKM Admins can allow CCKM users to manage external custom key stores through the Access Control List associated with the AWS account.

Creating an External Custom Key Store on CCKM

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that will own the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, click the **+ Add External Key Store** button. You might have to expand the **External Custom Key Stores** section to view the button.
5. Under **Config and Add Key Store**, provide the following settings:
 - **Key Store Name**. A friendly name for the Key Store.
 - **Region**. Compatible regions are listed in [AWS Key Management Service Deployment Guide](#).
 - **Enable success audit events**. Use this toggle to enable or disable audit recording of successful operations within an external key store. The toggle is turned off by default.

Note

This toggle displays only if the key store is of type "local".

Note

Enabling the **Enable success audit events** toggle significantly impacts the performance of the key store. Enable this feature only for the purpose of troubleshooting or presenting a demo.

- **Enable Mutual TLS.** Use this toggle to enable or disable TLS client-side certificate verification where the CipherTrust Manager authenticates the AWS KMS client. The toggle is turned off by default.

Note

If you plan to enable mutual TLS on an AWS external custom key store, and there is a load balancer in front of CCKM, then configure the load balancer so that SSL termination does not take place on it thereby allowing SSL/TLS Passthrough. This configuration is required for CCKM and AWS KMS to successfully exchange certificates.

Note

If enabling TLS client-side certificate verification, ensure to perform the following prerequisite steps:

- a. Create a CA signed certificate for one of the AWS Trusted CAs for the Web interface of your CipherTrust Manager.
- b. Download and add the AWS root CA certificate from the same AWS trusted CA to External CA on CipherTrust Manager. For more information, refer to [Creating an External CA](#).
- c. Add the CA signed certificate to the CipherTrust Manager web interface. For more information, refer [Using an externally generated server certificate for an interface](#).

- **Source.** Either CipherTrust Manager or Luna HSM.

Caution

The source you select at this time permanently affects the Hold Your Own Key (HYOK) and health check keys you can add to the external custom key store later. If you select Luna HSM, only Luna HSM keys can be used for health check, and as source keys to HYOK keys. If you select CipherTrust Manager, only CipherTrust Manager keys can be used for health check, and as source keys to HYOK keys. You cannot mix Luna HSM and CipherTrust Manager source keys or health check keys within the same external custom key store.

- **Key Store Container.** If using Luna HSM, select the [desired partition](#) that will store the source key(s) for the key store.
- **Link State.** Select **Unlinked** to create a key in the AWS External Key Store that is in an unlinked state. This means that the corresponding key store is not automatically created in AWS KMS, and you must

create it. Select **Linked** to create an AWS External Key Store that is linked to the CCKM external custom key store. If you select **Linked**, and there is at least one credential rotation schedule already added within **Schedules**, then you have the option to assign any of the available credential rotation schedules to this key store. Proceed to Step 6 and then Step 7 to assign a credential rotation schedule to this key store *after* entering all of the settings in this step. Otherwise, skip to Step 8 *after* entering all of the settings in this step. See [Linked and Unlinked States](#) for more information on the effects of these choices. See [Adding Credential Rotation Schedule \(AWS XKS only\)](#) for more information about adding a credential rotation schedule for an AWS External Key Store.

- **XKS Location.** Select **Amazon VPC**, if you will use an Amazon VPC to connect to the key store. Then enter the **VPC Endpoint Service Name** and the **XKS Proxy URI Endpoint**. Select **Public**, if you will use the Internet to connect to the key store. Enter the **XKS Proxy URI Endpoint** thereafter.

Note

VPC Endpoint Service Name can be obtained from AWS configuration.

XKS Proxy URI Endpoint refers to the hostname of the server entity which AWS KMS first connects to for cryptographic requests.

- For **Amazon VPC** deployments, this is the Private DNS Name set for the VPC endpoint service.
 - For Public deployments, this is usually the load balancer host name.
 - If AWS is connecting to CipherTrust Manager directly, this is the CipherTrust Manager fully qualified domain name.
- **Health Check Key.** From the drop-down list, select the **Key ID** of the symmetric AES-256 key to use for performing the health checks on the given key store. AWS initiates this health check on a given key store to check whether the store is up and running and can perform cryptographic operations. When CCKM receives this health check request from AWS, it performs the health check using the Key ID.

Note

The Health Check Key must be created before creating a key store.

Depending on the location of the key store, the health check is initiated.

- If the key store is on Luna HSM, the Health Check Key must have the following attributes:
 - **CKA_EXTRACTABLE = FALSE**

-
- `CKA_SENSITIVE = TRUE`
 - `CKA_ENCRYPT = TRUE`
 - `CKA_DECRYPT = TRUE`
 - `CKA_WRAP = TRUE`
 - `CKA_UNWRAP = TRUE`
 - If the key store is on CipherTrust Manager, the Health Check Key must have the following attributes:
 - `Key Not Exportable`
 - `Key Not Deletable`
 - Usage Masks - `Encrypt, Decrypt, Wrap, Unwrap`
 - **Max Credentials.** Enter the maximum number of valid credentials allowed at any given time. These credentials are used to authenticate KMS accessing the external custom key store. The valid values are from 2 to 20 (inclusive). Once a key store reaches the maximum number of credentials, the oldest credential is deleted. For more information about the use of the AWS credentials to access external key stores, refer to [AWS Key Management Service Deployment Guide](#).

6. Click **Next**.
7. (Optional) Under **Add Credential Rotation Schedule** and from the drop-down list, select the credential rotation schedule to assign to this key store.
8. Click **Add Key Store** to continue.

For linked key stores, CCKM tests that the AWS KMS account can reach CCKM with the provided connection and network parameters. If this connection test fails, you cannot create the new key store.

A summary of the settings is displayed on the **Retrieve Credentials** page.

- If desired, you can copy the **Health Check URI Path** value (using the copy button) at this time to check the health of a given CipherTrust Manager node. For each of your CipherTrust Manager nodes, create a routable endpoint URL by adding "https://(ip address or hostname of node)" as a prefix to this URI path. You can then use this end point to validate whether a custom key store is ready to handle requests. Load balancers can also be configured to call this endpoint for a health check. To obtain the status of a CipherTrust Manager node that is behind a load balancer, configure the node's health check URL in the load balancer. You can also retrieve the **Health Check URI Path** value later from the details page of the external custom key store.

Note

The **Health Check URI Path** value is only available for a custom key store that is a local key store (meaning the store is locally hosted on the given CCKM instance).

Note

If you added a credential rotation schedule for the new key store, the job config ID associated with the schedule displays under CREDENTIALS.

9. Click **Download** to download the credentials file required by AWS KMS.

Caution

This credentials file includes a secret access key string which AWS KMS requires, and you cannot access again. You must download the file, or copy the **secret access key** string before closing the **Add External Key Store** wizard, or you will need to [rotate credentials](#) to generate new credentials for AWS.

10. Click **Close**.

The new external custom key store is displayed under **External Custom Key Stores**.

11. Set up the corresponding AWS KMS external key store to communicate with the new CCKM external custom key store. Steps depend on whether the external custom key store is linked or unlinked.
 - **Linked key stores:** [connect](#) the new external key store.
 - **Unlinked key stores** [create the Corresponding Key Store on AWS KMS](#).

Creating the Corresponding External Key Store on AWS KMS for Unlinked Key Stores

If your new external customer key store is unlinked, this means that you must either [link the external custom key store](#) to create the corresponding external key store on AWS, or [manually create](#) the key store on AWS KMS through its console, API, or CLI.

Link an Unlinked External Custom Key Store

If you created an unlinked external custom key store, you can link it after creation. Linking an external custom key store automatically creates a corresponding external key store in AWS KMS.

Note

You cannot use this operation to link to an existing external custom key store on AWS KMS. To link an existing external custom key store, [refresh all external key stores for an AWS account](#).

If you want to set up [CipherTrust Manager hosted on premise with VPC connection](#), configure VPC endpoints as described in [AWS Key Management Service Deployment Guide](#) if you have not already. VPC endpoints are associated with an external custom key store.

To link an unlinked external custom key store:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find the desired external custom key store name.
5. From the **External Key Stores** display, click the ellipsis icon associated with the desired external custom key store.
6. Select **Link**.

The Link Key Store dialog displays.

7. Review the auto-populated networking details.

These include the **XKS Location** selected during [key store creation](#).

8. Edit networking details if needed.

For **Public** XKS Location, you can edit the **XKS URI Proxy Endpoint**.

For **Amazon VPC** XKS Location, you can edit **VPC Endpoint Service Name** and the **XKS Proxy URI Endpoint**

9. Click **Link** to confirm.

An external key store is created on AWS KMS.

10. Proceed to [connect](#) the newly linked key store.

Manually Create Key Store on AWS KMS

If you want to set up [CipherTrust Manager hosted on premise with VPC connection](#), configure VPC endpoints as described in [AWS Key Management Service Deployment Guide](#) if you have not already. VPC endpoints are associated with an external custom key store.

The following CipherTrust Manager and CCKM values are required for creating the external key store on AWS KMS:

- The CipherTrust Manager **FQDN**, in most deployments.

For VPC deployments, the CipherTrust Manager FQDN is provided for the **Proxy URI Endpoint** when you create the External Key Store on AWS KMS.

If you have a non-VPC deployment, and are not operating behind a load balancer, this is the value needed for **Proxy URI Endpoint** in AWS console.

- The load balancer hostname, if applicable for non-VPC deployments. This is used as the **Proxy URI Endpoint**.
- The credentials file downloaded during [External Custom Key Store Creation on CCKM](#) or when [rotating credentials](#). This file contains **Proxy URI path prefix**, **Access key ID**, and **Secret access key** values, which you can directly upload to AWS console.

Note

There is an additional field in the AWS console to create the external key store, **VPC endpoint service name**, for VPC deployments. This is the VPC endpoint service which you have associated with the CipherTrust Manager and custom external key store.

If you do not wish to provide the credentials configuration file, you can manually input the following values into AWS Console:

- The **Secret access key**.

This value is only available on first [creating the external custom key store creation on CCKM](#), or when you [rotate credentials](#) for an external custom key store. There are options during those operations to copy the secret access key string.

- **The XKS Proxy URI Path.** This value is available through the **External Custom Key Stores** details:
 - a. Open the **Cloud Key Manager** application.
 - b. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
 - c. Click the name of the account that owns the external custom key stores.
 - d. Under **External Custom Key Stores**, find the desired external custom key store name.
 - e. For the **XKS Proxy URI Path** for the external custom key store, click the copy button to copy the path.

The full path is copied. The AWS console already includes the **/kms/xks/v1** suffix, so you must delete

that part of the path when pasting.

- The **Access key ID**

- a. From the **External Key Stores** display, click the ellipsis icon associated with the desired external custom key store.
- b. Select **View/Edit Details**.
- c. Click the copy button next to the desired **Access Key ID** to copy this value.

After creating the external key store on KMS, you must connect it on KMS to begin sending cryptographic requests to CCKM.

Note

If you later [refresh all external custom key stores for an AWS account](#) on CCKM, this external key store on KMS will be detected, and linked to the corresponding external custom key store on CCKM.

Connect or Disconnect an External Custom Key Store

You can connect or disconnect AWS KMS external key stores. Linked external key stores are created in the **Disconnected** state, and must be connected either through CCKM or AWS console to begin sending requests to the CCKM external custom key store.

As a convenience, you can connect or disconnect linked external custom key stores on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find the desired external custom key store name.
5. From the **External Key Stores** display, click the ellipsis icon associated with the desired external custom key store.
6. Select **Connect** to connect or **Disconnect** to disconnect.

Connecting or disconnecting an external custom key store through CCKM results in the corresponding external key store on AWS changing state to **connected** or **disconnected**. The transient states of **connecting** and **disconnecting** display during the transition. Consult [AWS Key Management Service Deployment Guide](#) for details on the allowed operations associated with these states.

Creating Keys for the External Custom Key Store

After configuring external custom key stores in both CCKM and AWS, you can create the keys necessary to perform cryptographic operations in response to AWS KMS. This is described in [Creating Hold Your Own Key](#)

(HYOK) Keys.

Block or Unblock an External Custom Key Store

Blocking and unblocking an external custom key store is a way to temporarily suspend and restore AWS KMS's access to the key store and its keys.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find the desired external custom key store name.
5. From the **External Key Stores** display, click the ellipsis icon associated with the desired external custom key store.
6. Click **Block** or **Unblock**, depending on whether the key store is in a blocked or unblocked state.
7. You are asked to confirm the action. Click **Block** or **Unblock** again.

The status in the **Blocked** column updates on the table.

Rotate Credentials

Periodically rotating credentials for the external custom key store is a security best practice. CCKM retains and recognizes the number of credentials set as the Max Credentials for the key store, which is between 2 and 20 credentials (default 20 credentials). Once a key store reaches the maximum number of credentials, the oldest credential is deleted. At this time, AWS only retains one set of credentials for each external key store.

Caution

When you create a new credential for an unlinked key store, you must immediately copy the **secret access key** string or download the credentials file containing this string. There will not be another opportunity to retrieve this value. You must manually provide the credentials in AWS console.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find and click the desired external custom key store name.

The details page of the external custom key store is displayed.

5. Check that the key store is **unblocked**. For linked key stores, also check that the state is either **connected** or

disconnected. If the state is in one of the transient states of **connecting** or **disconnecting**, wait until the transition is completed before proceeding to the next step.

6. Click **Add Credential** to add a new credential.
7. Click **Download** to download the file containing the new credentials, including the **Access key ID** and **Secret access key**.

Caution

This credentials file includes a **secret access key** string which you cannot access again. You must download the file, or copy the **secret access key** string before closing the **Add Credential** dialog, or you cannot add the credentials to AWS console.

A new credential is displayed.

8. If you have a linked key store, [connect the key store](#).
9. If you have an unlinked key store, edit the corresponding external key store on AWS console to upload the new credentials as described in [AWS Key Management Service Deployment Guide](#).
10. If desired, you can delete existing credentials with the **Delete Credential** button. CCKM will no longer accept requests using these older credentials.

Assign Credential Rotation Schedule

You have the ability to assign a credential rotation schedule for the credentials of a given external custom key store in CCKM. The store **must** be a local and linked key store. With a linked key store, the auto rotated (new) credentials are updated in AWS KMS.

To assign a credential rotation schedule to a store, you must first create one or more rotation schedules for the key store's credentials in the Add New Schedule wizard within **Schedules** of the **Cloud Key Manager** application. Thereafter, these schedules are made available within a list under **Schedules** of the details page for the given custom key store.

Note

A credential (new or existing) that is associated with the key store continues to be operational until either you delete it manually or it is automatically rotated out and then deleted based on the configured maximum number of valid credentials allowed at any given time. The oldest credential is deleted after the key store reaches the maximum number of credentials.

1. Open the **Cloud Key Manager** application credentials to be updated in AWS KMS.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.

3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find and click the desired external custom key store name.

The details page of the external custom key store is displayed.

5. Under Schedules, click **Credential Rotation Schedule** drop-down list and select a rotation schedule to assign to the key store.
6. Click **Update** to apply the schedule to the key store.

The selected rotation schedule is displayed showing when the next credentials rotation is to take place.

Unassign Credential Rotation Schedule

In CCKM, you also have the ability to unassign a credential rotation schedule for a given external custom key store.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find and click the desired external custom key store name.

The details page of the external custom key store is displayed.

5. Under Schedules, select the **X** icon (Unassign button) to unassign the selected rotation schedule for the key store.

Delete an External Custom Key Store

Warning

Deleting an external custom key store is a irreversible operation which permanently deletes unique identifiers required by the corresponding AWS KMS external key store.

You must [delete all HYOK keys in an external custom key store](#) before you can delete the external custom key store.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find the desired external custom key store name.

5. From the **External Key Stores** display, click the ellipsis icon associated with the desired external custom key store.
6. Click **Delete Store**.
7. You are asked to confirm the action. Enable the **I wish to delete this Key Store** checkbox and click **Delete**.

Update General Information for an External Custom Key Store

From the details page of an external custom key store, you can update general information for the key store.

You can update the following attributes of all external custom key store:

- Key Store Name
- XKS Location

You can update the following attributes for local external custom key stores only:

- Health Check Key
- Max Credentials
- Enable success audit events (by enabling or disabling this toggle depending on the current setting)
- Enable Mutual TLS (by enabling or disabling this toggle depending on the current setting)

You cannot edit health check key or max credentials for a remote type external custom key stores, which can appear after [refreshing external custom key stores for an AWS account](#).

Note

The **XKS Proxy URI Endpoint** value displays on the details page of an external custom key store. If desired, you can copy this value, which is uneditable, by clicking the copy button. If the custom key store is local, the **Health Check URI Path** value also displays on the details page of an external custom key store. If desired, you can copy this value, which is uneditable, by clicking the copy button.

The steps to update this information depends on whether the external custom key store is [linked](#) or [unlinked](#).

To update the key store

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Under **External Custom Key Stores**, find and click the desired external custom key store name.

The details page of the external custom key store is displayed.

5. Check that the state is **unblocked**. For linked key stores, also check that the state is **disconnected**.
6. In the General Info section, enter a new **Key Store Name**, if desired.
7. Change the **XKS Location** settings if desired to update networking details.

- Select **Amazon VPC**, if you will use an Amazon VPC to connect to the key store. Then enter the **VPC Endpoint Service Name** and the **XKS Proxy URI Endpoint**.

Caution

To avoid interruption in service, configure VPC endpoints in AWS **before** updating Amazon VPC details on an external custom key store in CCKM.

- Select **Public**, if you will use the Internet to connect to the key store. Enter the **XKS Proxy URI Endpoint**.

8. Select a new **Health Check Key**, if desired.

The health check key must be a symmetric AES-256 key.

The health check key must come from the key store's existing **Key Source Container**, CipherTrust Manager or Luna HSM connection.

9. Select a new number of **Max Credentials**, if desired. Valid values are between 2-20.
10. Change the setting of the **Enable success audit events** toggle to either enable or disable this feature, if desired. This toggle displays only if the key store is of type "local".
11. Change the setting of the **Enable Mutual TLS** toggle to either enable or disable this feature, if desired.

Note

If enabling TLS client-side certificate verification, ensure to perform the following prerequisite steps:

- a. Create a CA signed certificate for one of the AWS Trusted CAs for the Web interface of your CipherTrust Manager.
- b. Download and add the AWS root CA certificate from the same AWS trusted CA to External CA on CipherTrust Manager. For more information, refer to [Creating an External CA](#).
- c. Add the CA signed certificate to the CipherTrust Manager web interface. For more information, refer to [Using an externally generated server certificate for an interface](#).

12. Click **Update** to apply the new settings.

13. If you have a linked key store, [connect the key store](#).

Refresh All External Custom Key Stores and Keys for an AWS Account

This operation detects and imports all external key stores and external keys present on the KMS account.

This can include external key stores that don't have an external custom key store on the local CCKM. These could be associated with an external custom key store on another CCKM that is not clustered to the local CCKM, or to another vendor's external key manager. These key stores are display with the type **Remote**.

Refreshing all external custom key stores can set unlinked external custom key stores to a linked state. This happens when CCKM detects a corresponding KMS external key store for an local unlinked external custom key store. This operation can also set unlinked [HYOK keys](#) to a linked state.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > AWS KMS Accounts**. The AWS KMS Accounts page is displayed.
3. Click the name of the account that owns the key store. The account details page is displayed.
4. Next to the **External Custom Key Store** table, click **Refresh All**.

The **This may take a while...** message is displayed.

5. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

AWS XKS Performance Summary

We have tested different environments to capture performance metrics for the CipherTrust Cloud Key Manager (CCKM) AWS External Key Service integration. The performance results provided within this document demonstrate the effects of deployment choices on throughput for AWS HYOK key encrypt operations for one key within one key store. This can help you plan your CipherTrust Manager deployment to meet your performance needs for AWS XKS integration. There is an AWS requirement that encrypt and decrypt requests must be completed within 250 ms. Thus, the results are presented to show the throughput possible before meeting that threshold.

All environments used an open source k6.io tool (<https://k6.io/>) as the REST client to simulate encrypt requests from AWS KMS. The client ran on a virtual machine with 50 GB system volume, 8 CPUs, and 64 GB of memory. For the deployments using LUNA HSM as a key source, the HSM model of Luna K7 was employed.

Note

Actual performance numbers in your environment may be different. The results can vary based on factors, such as how and where the CipherTrust Manager is deployed, CipherTrust Manager resources, the location of cloud KMS, the key source of your choice, the network connectivity between the CipherTrust Manager, AWS Cloud and your key source, as well as how the traffic is load balanced.

Tested Environments

The following deployments were tested:

- Luna Network HSM as a key source (on premises or GCP):
 - Single node of CipherTrust Manager on premises, K6 client on premises, single node of HSM
 - Single node of CipherTrust Manager on premises, K6 client on premises, two nodes of HSM in HA mode
 - Single node of CipherTrust Manager on premises, K6 client on premises, HSM in Export mode and Clone mode
 - Single node of CipherTrust Manager on GCP, K6 client on AWS, single node of HSM
 - Single node of CipherTrust Manager on GCP, K6 client on AWS, two nodes of HSM in HA mode
 - Single node of CipherTrust Manager on GCP, K6 client on AWS, HSM in Export mode and Clone mode
 - Two Cluster nodes of CipherTrust Manager on GCP, K6 client on AWS, Two nodes of HSM in HA mode
- CipherTrust Manager as a key source (on premises and on AWS):
 - Single node of CipherTrust Manager on premises, K6 client on premises
 - Single node of CipherTrust Manager on GCP, K6 client on AWS
 - Single node of CipherTrust Manager on AWS, K6 client on AWS
 - Two clustered CipherTrust Manager nodes on AWS, K6 client on AWS

The following CipherTrust Manager release version was employed in the tested deployments:

Description	Value
Release version	2.11.1+9742

CipherTrust Managers were deployed as geographically close to the K6 client as possible to avoid potential network latencies, which can occur when crossing geographic regions. In your CCKM deployment, we similarly recommend deploying the virtual CipherTrust Manager instance geographically close to one of the AWS KMS regions where you intend to set up the AWS XKS. We recommend a network latency of round-trip communication of 35 ms or less between AWS KMS and the CipherTrust Manager. Also, if you are using Luna Network HSM as your key source for AWS HYOK, ensure the CipherTrust Manager and the HSM are geographically close and has the lowest possible latency. We recommend a network latency of round-trip communication of 25 ms or less between the CipherTrust Manager and the HSM.

The following graph was generated using a model of XKS performance. Simulated data is displayed. In this model, the internal latency of the CCKM was pre-set and the network latency between CipherTrust Manager/CCKM and the HSM was varied. The resulting data displayed in the graph captures the rapid degradation of performance with increasing network latency between CipherTrust Manager/CCKM and the HSM. In other words, increasing the latency to the HSM results in an (undesirable) non-linear degradation in performance.

Encrypt/Decrypt performance (Y axis) vs CipherTrust Manager-to-HSM latency (X axis, milliseconds)

Network Requirements

The following ports were opened to ensure CipherTrust Manager communication:

Used to communicate with CipherTrust Manager:

Type	Protocol	Port Number
SSH	TCP	22
HTTPS	TCP	443
postgresql (for cluster)	TCP	5432

Used for Connection to LUNA HSM:

Type	Protocol	Port Number
Secure Trusted Channel (STC)	TCP	5656
network trust link service (NTLS)	TCP	1792

Test process

The test consisted of starting a given number of virtual users to perform encrypt operations on the AWS XKS/HYOK key. Each user simulated a separate thread. Total test duration was 40 seconds for each reading. The test was divided into the following increments:

- Ramp-up time was 5 seconds. Virtual users were started.
- Test duration was 30 seconds for each reading. Virtual users make wrap requests during this time.
- Ramp-down time was 5 seconds. Virtual users were stopped until there were zero active virtual users.

Repeating the test in your environment

We have published the scripts used with `k6 .io` on [Github](#), for you to repeat the tests in your own environments as desired.

AWS XKS deployment results

- LUNA HSM as a Key Source
- CipherTrust Manager as a Key Source

LUNA HSM as a key source

LUNA HSM details

HSM Details

Description	Value
Firmware	7.3.3
HSM Model	Luna K6
Authentication Method	Password

Single node of CipherTrust Manager on premises, K6 client on premises, single node of HSM

4 CPU - 64 GB RAM

This deployment includes the following:

- Single node of CipherTrust Manager on premises
- K6 client on premises
- Single node of HSM on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	SanJose Lab ESXi
CM-2.11.1	50	4	16	SanJose Lab ESXi

The network latency between the CipherTrust Manager and the K6 client is **0.730** ms and between the CipherTrust Manager and the HSM is **0.230** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
10	14822	370.488464	44.19
20	19368	484.096976	58.21
30	18080	451.987655	100.13
40	18487	462.077984	130.53
50	19410	485.225354	154.07
60	18850	471.240975	195.45
70	18407	460.053475	226.3

300	41278	1031.763766	617.22

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **968.739411** per second.

Single node of CipherTrust Manager on premises, K6 client on premises, two nodes of HSM in HA mode

This deployment includes the following:

- Single node of CipherTrust Manager on premises
- K6 client on premises
- Two nodes of HSM (in HA mode) on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	SanJose Lab ESXi
CM-2.11.1	50	8	64	SanJose Lab ESXi

The network latency between the CipherTrust Manager and the K6 client is **0.730** ms and between the CipherTrust Manager and the HSM is **0.366** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time

300	41946	1048.570249	567.91

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **1018.119718** per second.

Single node of CipherTrust Manager on GCP, K6 client on AWS, single node of HSM

This deployment includes the following:

- Single node of CipherTrust Manager on GCP Cloud

- K6 client on AWS
- Single node of HSM on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)
CM-2.11.1	50	4	16	GCP (us-central-1)

The network latency between the CipherTrust Manager and the K6 client is **29.476** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	9583	239.413903	254.37
60	9582	239.396327	313.11
70	9409	235.152891	382.31
80	9685	241.639279	414.86
90	9899	247.195932	438.65
100	9239	230.564444	512.74
11	987	246.283066	532.34
120	9946	248.564488	587.08

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **239.413903** per second.

Single node of CipherTrust Manager on GCP, K6 client on AWS, two nodes of HSM in HA mode

This deployment includes the following:

- Single node of CipherTrust Manager on GCP Cloud
- K6 client on AWS
- Two nodes of HSM (in HA mode) on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)
CM-2.11.1	50	4	16	GCP (us-central-1)

The network latency between the CipherTrust Manager and the K6 client is **29.476** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	8473	211.770214	293.19
60	8796	219.767535	344.01
70	9030	225.36262	401.19
80	9119	227.559996	461.01
90	9251	231.20168	530.24
100	9019	225.17429	573.95

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **211.770214** per second.

Single node of CipherTrust Manager on GCP, K6 client on AWS, HSM in Export mode and Clone mode

This deployment includes the following:

- Single node of CipherTrust Manager on GCP Cloud
- K6 client on AWS
- Sing node of HSM (in Export mode and Clone mode) on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)
CM-2.11.1	50	4	16	GCP (us-central-1)

The network latency between the CipherTrust Manager and the K6 client is **29.476** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	8855	221.314997	285.33
60	9569	238.829389	315.33
70	9709	242.311532	364.37
80	9772	243.883417	424.64

100	9403	234.881415	533.49
110	9885	246.753465	583.31

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **221.314997** per second.

Two Cluster nodes of CipherTrust Manager on GCP, K6 client on AWS, two nodes of HSM in HA mode

This deployment includes the following:

- Two cluster nodes of CipherTrust Manager on GCP Cloud
- K6 client on AWS
- Two nodes of HSM (in HA mode) on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)
CM-2.11.1	50	4	16	GCP (us-central-1)
CM-2.11.1	50	4	16	GCP (us-central-1)

The network latency between the CipherTrust Manager and the K6 client is **29.476** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	8073	201.491849	323.26
60	12028	300.535836	289.25
70	16026	400.02639	209.51
80	16259	405.714295	242.97
90	16314	407.633572	277.7
100	17391	434.59756	314.73
110	17116	427.846397	320.92
120	17738	442.825828	336.91
130	18734	467.888171	368.49
140	18682	466.437955	396.66
150	18697	466.81158	427.09
160	19161	478.306436	453.75
170	18373	459.156292	477.44
180	19321	482.126969	526.24
190	19268	480.678308	561.78
200	18930	472.625649	594

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **407.633572** per second.

CipherTrust Manager as a key source

Single node of CipherTrust Manager on premises, K6 client on premises

4 CPU - 16 GB RAM

This deployment includes the following:

- Single node of CipherTrust Manager on premises
- K6 client on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	SanJose Lab ESXi
CM-2.11.1	50	4	16	SanJose Lab ESXi

The network latency between the CipherTrust Manager and the K6 client is **0.730** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
90	46726	1168.127735	106.25
100	45656	1141.353196	115.56
110	47627	1190.614976	121.09
120	47388	1184.652163	135.07
130	45875	1146.845218	150.92
140	47694	1192.265223	154.17

290	47486	1187.052589	331.72
300	46093	1152.273184	347.54

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **1154.094363** per second.

8 CPU - 32 GB RAM

This deployment includes the following:

- Single node of CipherTrust Manager on premises
- K6 client on premises

Here are details of this deployment:

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	SanJose Lab ESXi
CM-2.11.1	50	8	32	SanJose Lab ESXi

The network latency between the CipherTrust Manager and the K6 client is **0.730** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
200	108572	2714.132852	101.53

1250	244514	6112.681305	252.87

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **6112.681305** per second.

Single node of CipherTrust Manager on GCP, K6 client on AWS

This deployment includes the following:

- Single node of CipherTrust Manager on GCP Cloud
- K6 client on AWS

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)
CM-2.11.1	50	4	16	GCP (us-central-1)

The network latency between the CipherTrust Manager and the K6 client is **29.476** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	21884	547.093178	113.14
60	22434	560.710964	132.19
70	22457	561.273174	157.98
80	23081	576.869185	168.56
90	23086	576.986894	196.33
100	23084	576.615912	229.77
110	23611	589.93677	244.65
120	23612	389.971801	264.87
130	23119	577.695201	300.05
140	23127	577.954035	318.79
150	23266	581.336016	358.63
160	24791	619.637581	344.87
170	24067	601.346708	408.58
180	24292	607.122047	412.1
190	23905	597.135154	429.96
200	23974	599.1375	455.52
210	22225	555.446348	500.47
220	24882	621.629199	471.24
230	25116	627.414426	482.22

250	24851	389.19375	561.02
260	24889	622.076392	581.02

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **389.971801** per second.

Single node of CipherTrust Manager on AWS, K6 client on AWS

This deployment includes the following:

- Single node of CipherTrust Manager on AWS
- K6 client on AWS

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)
CM-2.11.1	50	4	16	AWS (us-east-1)

The network latency between the CipherTrust Manager and the K6 client is **0.515** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	37535	938.334429	73.35
100	38745	968.593287	140.72
150	38386	959.62642	211.53
200	37192	929.770284	298.63
250	37392	934.748604	369.35
300	36731	918.200794	450.55
350	37259	931.380753	503
400	37976	949.319603	550.38

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **929.770284** per second.

Two clustered CipherTrust Manager nodes on AWS, K6 client on AWS

This deployment includes the following:

- Two clustered nodes of CipherTrust Manager on AWS
- K6 client on AWS

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
k6 Client	50	8	64	AWS (us-east-1)

Setup	System Volume (GB)	CPUs	Memory (GB)	Location
CM-2.11.1	50	4	16	AWS (us-east-1)
CM-2.11.1	50	4	16	AWS (us-east-1)

The network latency between the CipherTrust Manager and the K6 client is **0.515** ms.

Results:

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
50	75488	1887.087646	37.04
100	75724	1893.008797	74.1
150	78373	1959.190548	104.05
200	78286	1957.096186	136.88
250	76990	1924.686689	174.14
300	78426	1960.606549	208.27
350	77211	1930.219812	250.07
400	76152	1903.644125	282.48
450	78339	1958.447676	319.52
500	77479	1936.947471	348.31
550	77423	1935.50092	379.68
600	78721	1967.922819	412.16
650	78226	1955.612616	435.96
700	77420	1935.364058	477.81
750	78340	1958.367054	515.7
800	75553	1888.684818	550.19

Observation:

For this deployment, a response time compliance of 250 ms was met for a maximum throughput of **1930.219812** per second.

Conclusion

- The performance improves with higher number of CPUs. The minimum number of CPUs and RAM required: 4 CPUs and 16 GB RAM.

- Performance linearly improves with adding more CipherTrust Manager nodes.

- Partition mode (Export vs Clone) does not have any impact on performance.
- Changing HSM connections (STC vs NTLS) does not have significant affect on performance.

- If you are using Luna Network HSM as your key source for AWS HYOK, ensure the CipherTrust Manager and the HSM are geographically close and has the lowest possible latency. Increasing the latency to the HSM results in degradation in performance.

- Different models of Luna 7 HSMs have their maximum throughput. Depending on your requirement, ensure to choose a model that can meet your needs. Ensure the HSM throughput does not become a bottle neck for the deployment. Refer to Luna HSM documentation for more information. CCKM uses the AES-GCM small packet encryption algorithm on a Luna HSM for AWS XKS operations. Refer to the **Luna Network HSM 7 Specifications** section under the **Specifications** tab (next to **Overview** and **Features**) within **Thales LUNA HSM** to view the performance numbers for the various Luna HSM models using the AES-GCM small packet encryption algorithm.
- The results captured was for one HYOK key in one key store, which represents the total throughput. When the number of key stores is higher, the total throughput will be cumulative across key stores.

Microsoft Azure Resources

Refer to the following sections to manage Azure resources on CCKM:

- Prerequisites
- Managing Azure Vaults
- Managing Azure Keys
- Managing Azure Certificates
- Managing Azure Secrets
- Scheduling Operations
- Managing Azure Reports
- Viewing Azure Subscriptions
- Allowing AD Users to Manage Azure Vaults
- Configuring Connection to Azure Using Private Link
- Downloading Azure Metadata

Prerequisites

This section describes the prerequisites to manage Azure resources on CCKM.

- Prerequisites for Azure Cloud
- Prerequisites for Azure Stack Cloud with Azure AD
- Prerequisites for Azure Stack Cloud with Azure ADFS
- Azure Key Backup Storage Requirement

Note

- To use Luna HSM as a key source, a Luna HSM connection must already exist on the CipherTrust Manager. The Luna HSM partition must already be added in CCKM. Refer to [Prerequisites](#).
- FM-enabled Luna HSM is not supported as a key source.

Note

To use DSM as a key source, a DSM connection must already exist on the CipherTrust Manager. The DSM domain must already be added in CCKM. Refer to [Prerequisites](#).

Azure Key Backup Storage Requirements

Number of versions in the Azure key	Cloud key backup size for RSA 2048 key	Cloud key backup size for RSA 3072 key	Cloud key backup size for RSA 4096 key
1 version	24 kB	24 kB	24 kB
10 version	80 kB	88 kB	144 kB
20 version	144 kB	192 kB	232kB

Note

The above sample results are from one of Azure production accounts. The numbers might be different in customer environments.

Prerequisites for Azure Cloud

Before adding an Azure cloud in CCKM:

1. Register CCKM App on Azure Portal
2. Subscribe CCKM App on Azure Portal
3. Set Required Permissions on CCKM App on Azure Portal
4. Assign CCKM App Permissions
5. Add Azure Connection on CipherTrust Manager

Register CCKM App on Azure Portal

Before adding an Azure cloud to CCKM, you must register the CCKM app and assign required permissions on the Azure portal. Then, depending on the type of app credential you plan to employ, either create a key (client secret) on the Azure portal or generate a certificate from CCKM, download it, and then upload it to Azure. This entire process generates the connection data needed to configure the Azure cloud.

To register the app:

1. Create an Azure Active Directory application on the Azure Portal:

On **Azure Active Directory > App registrations > New registration**, provide the following parameters:

- a. Choose a **Name** for the app that CCKM will use to access Azure.
- b. Select the account type under **Supported account types**. Select either of the following:
 - Accounts in this organizational directory only (<account-name> (Default Directory) only - Single tenant)

- Accounts in any organizational directory (Any Azure AD directory - Multitenant)

c. Click **Register**. The CCKM app creation starts. The app creation might take some time.

2. Access the new app under **App registrations**.
3. From **App registrations** > **{App Name}** > **Overview**, copy **Application (client) ID** and **Directory (tenant) ID**.
4. Navigate to **App registrations** > **{App Name}** > **Manage** > **Certificates & secrets**.
5. Create a new client secret or upload the certificate:
 - Secret (password) — The user will generate a secret key in Azure when registering the app, and then copy the secret key and provide it to the app.
 - Certificate (public key) — The user will create a private key and public key pair locally, create a certificate for the public key, and then provide the certificate to Azure when registering the app. For the private key, the app will create a client assertion and send it to Azure when making OAuth authentication calls.

Depending on your requirements, you can use a self-signed or CA-signed certificate. Refer to [Certificate creation methods](#) in the Azure documentation for details.

Subscribe CCKM App on Azure Portal

1. Access **Subscriptions** > **{Subscription name}** > **Access control (IAM)**.
2. Click **Add** > **Add role assignment**. The **Add role assignment** pane is displayed.
3. Select **Reader** from the **Role** drop-down list.
4. Select **User, group, or service principal** from the **Assign access to** drop-down list.
5. Under **Select**, enter the name of your CCKM app.
6. Click **Save**.

Set Required Permissions on CCKM App on Azure Portal

1. Access **App Registrations** > **{App Name}** > **Manage** > **API permissions**.
2. Click **+ Add a permission** and add the following APIs and their associated permissions:
 - **Azure Key Vault** (Delegated permissions): Have full access to the Azure Key Vault service.
 - **Azure Service Management** (Delegated permissions): Access Azure Service Management as organization users (preview).

Assign CCKM App Permissions

Assign CCKM App Permissions to Required Key Vault in the Azure Portal

Azure supports two types of permission models, vault access policy and azure role-based access control. Steps to assign CCKM app permissions to your key vaults on Azure portal vary based on the permission model of the vault, as described below.

Vault Access Policy

1. Access **Key vaults** > **{Key Vault Name}** > **Settings** > **Access policies**.
2. On the right, click **+ Add Access Policy**.
3. Add the following details:
 - From the **Key permissions** list, select **Key Management Operations** and **Privileged Key Operations**.
 - From the **Secret permissions** list, select **Secret Management Operations** and **Privileged Secret Operations**.
 - From the **Certificate permissions** list, select **Certificate Management Operations** and **Privileged Certificate Operations**.
 - Next to the **Select principal** label, click **None selected**, browse the CCKM app, and select it.
4. Click **Add**.

Azure Role-based Access Control

1. Access **Key vaults** > **{Key Vault Name}** > **Access control (IAM)**. The right pane provides options to view your existing level of access, assign a role, and view access to the vault.
2. Under **Grant access to this resource**, click **Add role assignment**.
3. On the **Roles** tab of the **Add role assignment** page, select **Key Vault Administrator**. Use the search field to search for the role.
4. Click **Next**.
5. On the **Members** tab, make sure that **Assign access to** is set to **User, group, or service principal**.
6. Click **+ Select members**.
7. On the right, in the **Select members** pane, select the desired CCKM app. Use the search field to search for your CCKM app. The **Selected members** section shows the selected app.
8. In the right pane, click **Select**.

-
9. (Optional) Provide a basic **Description** of the member.
 10. Click **Next**.
 11. Review the details. If the details are incorrect or you want to modify them, click **Previous** and update the details.
 12. Click **Review + assign**. The selected role with desired permissions is assigned to the CCKM app.

Assign CCKM App Permissions to the Required Managed HSM Vault in the Azure Portal

1. Sign in to the Microsoft Azure portal.
2. Click **Azure Key Vault Managed HSMs**.
3. Select the desired Azure Key Vault Managed HSM from the list. The selected Azure Key Vault Managed HSM opens.
4. Click **Settings > Local RBAC**.
5. Add a Crypto Officer.
 - a. Click **Add**. The Role Assignment window appears.
 - b. Under Role, select **Managed HSM Crypto Officer**.
 - c. Under Scope, select **All keys (/ or /keys)**.
 - d. Click **Select security principal**. The Add principal wizard appears.
 - e. Search for and select the desired **principal**.

Note

Ensure that the type of the selected principal is an enterprise application.

- f. Click **Select**.
 - g. Click **Create**.
6. Add a Crypto User.
 - a. Click **Add**. The Role Assignment window appears.
 - b. Under Role, select **Managed HSM Crypto User**.

- c. Under Scope, select **All keys (/ or /keys)**.
- d. Click **Select security principal**. The Add principal wizard appears.
- e. Search for and select the desired **principal**.

Note

Ensure that the type of the selected principal is an enterprise application.

- f. Click **Select**.
- g. Click **Create**.

Add Azure Connection on CipherTrust Manager

Before you can add an Azure vault to the CCKM, an Azure connection must already exist on the CipherTrust Manager. A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connections Management](#) for details.

Now, [Azure vaults](#) and [Azure keys](#) can be managed on the CipherTrust Manager.

Prerequisites for Azure Stack Cloud with Azure AD

Before adding an Azure Stack cloud with Azure AD in CCKM:

1. [Register CCKM App on Azure Portal](#)
2. [Set Required Permissions on CCKM App on Azure Portal](#)
3. [Connect with Azure AD](#)
4. [Subscribe CCKM App on Azure Stack Portal](#)
5. [Assign CCKM App Permissions to Required Key Vault on Azure Stack Portal](#)
6. [Add Azure Connection on CipherTrust Manager](#)

Register CCKM App on Azure Portal

Before adding an Azure cloud to CCKM, you must register the CCKM app and assign required permissions on the Azure portal. Then, depending on the type of app credential you plan to employ, either create a key (client secret) on the Azure portal or generate a certificate from CCKM, download it, and then upload it to Azure. This entire process generates the connection data needed to configure the Azure cloud.

To register the app:

1. Create an Azure Active Directory application on the Azure Portal:

On **Azure Active Directory > App registrations > New registration**, provide the following parameters:

- a. Choose a **Name** for the app that CCKM will use to access Azure.
 - b. Select the account type under **Supported account types**. Select either of the following:
 - Accounts in this organizational directory only (<account-name> (Default Directory) only - Single tenant)
 - Accounts in any organizational directory (Any Azure AD directory - Multitenant)
 - c. Click **Register**. The CCKM app creation starts. The app creation might take some time.
2. Access the new app under **App registrations**.
 3. From **App registrations > {App Name} > Overview**, copy **Application (client) ID** and **Directory (tenant) ID**.
 4. Navigate to **App registrations > {App Name} > Manage > Certificates & secrets**.
 5. Create a new client secret or upload the certificate:
 - Secret (password) — The user will generate a secret key in Azure when registering the app, and then copy the secret key and provide it to the app.
 - Certificate (public key) — The user will create a private key and public key pair locally, create a certificate for the public key, and then provide the certificate to Azure when registering the app. For the private key, the app will create a client assertion and send it to Azure when making OAuth authentication calls.

Depending on your requirements, you can use a self-signed or CA-signed certificate. Refer to [Certificate creation methods](#) in the Azure documentation for details.

Set Required Permissions on CCKM App on Azure Portal

1. Access **App Registrations > {App Name} > Manage > API permissions**.
2. Click **+ Add a permission** and add the following APIs and their associated permissions:
 - **Azure Key Vault** (Delegated permissions): Have full access to the Azure Key Vault service.
 - **Azure Service Management** (Delegated permissions): Access Azure Service Management as organization users (preview).

Connect with Azure AD

1. Log on to your Azure AD VM.
2. Connect to Azure Stack Hub with PowerShell as a user. Refer to [Connect to Azure Stack Hub with PowerShell as a user - Azure Stack Hub](#) for details.

- Run the following command in Windows PowerShell:

```
Get-AzureRmEnvironment -name AzureStackUser | Format-List
```

A sample output is shown below:

```
Name : AzureStackUser
EnableAdfsAuthentication : False
OnPremise : False
ActiveDirectoryServiceEndpointResourceId : https://management.azurecc
km.onmicrosoft.com/7f683eac-8000-2a43-3f9e-86d9117cc571
AdTenant :

```

The sample output above lists a number of links that are required while creating an Azure connection on the CipherTrust Manager. Use the *actual* links that are returned by the command on your setup. Refer to [Add](#)

Azure Connection on CipherTrust Manager for details.

The fields in the sample output and on the **Configure Azure Stack** page of the Add Connection dialog box on the CipherTrust Manager differ slightly. Here is the mapping to help you configure the connection appropriately.

Sample Output	Azure Connection Manager
ActiveDirectoryServiceEndpointResourceId	Management URL
ResourceManagerUrl	Resource Manager URL
ActiveDirectoryAuthority	Active Directory Endpoint
AzureKeyVaultDnsSuffix	Key Vault DNS Suffix
AzureKeyVaultServiceEndpointResourceId	Vault Resource URL

- Download the SSL certificate of the Azure Stack portal. Refer to online resources for details.

Subscribe CCKM App on Azure Stack Portal

- Access **Subscriptions** > {Subscription name} > **Access control (IAM)**.
- Click **Add** > **Add role assignment**. The **Add role assignment** pane is displayed.
- Select **Reader** from the **Role** drop-down list.
- Select **User, group, or service principal** from the **Assign access to** drop-down list.
- Under **Select**, enter the name of your CCKM app.
- Click **Save**.

Assign CCKM App Permissions to Required Key Vault on Azure Stack Portal

Azure supports two types of permission models, vault access policy and azure role-based access control. Steps to assign CCKM app permissions to your key vaults on Azure portal vary based on the permission model of the vault, as described below.

Vault Access Policy

- Access **Key vaults** > {Key Vault Name} > **Settings** > **Access policies**.
- On the right, click **+ Add Access Policy**.
- Add the following details:
 - From the **Key permissions** list, select **Key Management Operations** and **Privileged Key Operations**.

- From the **Secret permissions** list, select **Secret Management Operations** and **Privileged Secret Operations**.
- From the **Certificate permissions** list, select **Certificate Management Operations** and **Privileged Certificate Operations**.
- Next to the **Select principal** label, click **None selected**, browse the CCKM app, and select it.

4. Click **Add**.

Azure Role-based Access Control

1. Access **Key vaults** > **{Key Vault Name}** > **Access control (IAM)**. The right pane provides options to view your existing level of access, assign a role, and view access to the vault.
2. Under **Grant access to this resource**, click **Add role assignment**.
3. On the **Roles** tab of the **Add role assignment** page, select **Key Vault Administrator**. Use the search field to search for the role.
4. Click **Next**.
5. On the **Members** tab, make sure that **Assign access to** is set to **User, group, or service principal**.
6. Click **+ Select members**.
7. On the right, in the **Select members** pane, select the desired CCKM app. Use the search field to search for your CCKM app. The **Selected members** section shows the selected app.
8. In the right pane, click **Select**.
9. (Optional) Provide a basic **Description** of the member.
10. Click **Next**.
11. Review the details. If the details are incorrect or you want to modify them, click **Previous** and update the details.
12. Click **Review + assign**. The selected role with desired permissions is assigned to the CCKM app.

Add Azure Connection on CipherTrust Manager

Before you can add an Azure vault to the CCKM, an Azure connection must already exist on the CipherTrust Manager. A CipherTrust Manager administrator manages connections to external resources on the **Access Management** > **Connections Management** page of the CipherTrust Manager GUI. Refer to [Connections Management](#) for details.

Now, [Azure vaults](#) and [Azure keys](#) can be managed on the CipherTrust Manager.

Prerequisites for Azure Stack Cloud with Azure ADFS

Before adding an Azure Stack cloud with Azure ADFS in CCKM:

1. [Create Service Principal for Azure Stack Cloud with ADFS](#)
2. [Connect with Azure AD](#)
3. [Assign CCKM App Permissions to Required Key Vault on Azure Stack Portal](#)
4. [Add Azure Connection on CipherTrust Manager](#)

Create Service Principal for Azure Stack Cloud with ADFS

A service principal for CCKM in ADFS is needed if you are using ADFS as the identity provider. Refer to the [Azure Stack documentation](#) for details.

Connect with Azure AD

1. Log on to your Azure AD VM.
2. Connect to Azure Stack Hub with PowerShell as a user. Refer to [Connect to Azure Stack Hub with PowerShell as a user - Azure Stack Hub](#) for details.
3. Run the following command in Windows PowerShell:

```
Get-AzureRmEnvironment -name AzureStackUser | Format-List
```

A sample output is shown below:

```
Name : AzureStackUser
EnableAdfsAuthentication : False
OnPremise : False
ActiveDirectoryServiceEndpointResourceId : https://management.azure.com/7f683eac-8000-2a43-3f9e-86d9117cc571
AdTenant :
GalleryUrl : https://providers.azurestack.local:30016/
ManagementPortalUrl :
ServiceManagementUrl :
PublishSettingsFileUrl :
ResourceManagerUrl : https://management.local.azurestack.external
```

```

SqlDatabaseDnsSuffix           :
StorageEndpointSuffix         : local.azurestack.external
ActiveDirectoryAuthority       : https://login.microsoftonline.com/
GraphUrl                       : https://graph.windows.net/
GraphEndpointResourceId        : https://graph.windows.net/
TrafficManagerDnsSuffix       :
AzureKeyVaultDnsSuffix        : vault.local.azurestack.external
DataLakeEndpointResourceId     :
AzureDataLakeStoreFilesystemEndpointSuffix :
AzureDataLakeAnalyticsCatalogAndJobEndpointSuffix :
AzureKeyVaultServiceEndpointResourceId : https://vault.local.azurestack.external
AzureOperationalInsightsEndpointResourceId :
AzureOperationalInsightsEndpoint :
AzureAnalysisServicesEndpointSuffix :
VersionProfiles               : {}
ExtendedProperties             : {}
BatchEndpointResourceId

```

The sample output above lists a number of links that are required while creating an Azure connection on the CipherTrust Manager. Use the *actual* links that are returned by the command on your setup. Refer to [Add Azure Connection on CipherTrust Manager](#) for details.

The fields in the sample output and on the **Configure Azure Stack** page of the Add Connection dialog box on the CipherTrust Manager differ slightly. Here is the mapping to help you configure the connection appropriately.

Sample Output	Azure Connection Manager
ActiveDirectoryServiceEndpointResourceId	Management URL
ResourceManagerUrl	Resource Manager URL
ActiveDirectoryAuthority	Active Directory Endpoint
AzureKeyVaultDnsSuffix	Key Vault DNS Suffix
AzureKeyVaultServiceEndpointResourceId	Vault Resource URL

- Download the SSL certificate of the Azure Stack portal. Refer to online resources for details.

Assign CCKM App Permissions to Required Key Vault on Azure Stack Portal

Azure supports two types of permission models, vault access policy and azure role-based access control. Steps

to assign CCKM app permissions to your key vaults on Azure portal vary based on the permission model of the vault, as described below.

Vault Access Policy

1. Access **Key vaults** > **{Key Vault Name}** > **Settings** > **Access policies**.
2. On the right, click **+ Add Access Policy**.
3. Add the following details:
 - From the **Key permissions** list, select **Key Management Operations** and **Privileged Key Operations**.
 - From the **Secret permissions** list, select **Secret Management Operations** and **Privileged Secret Operations**.
 - From the **Certificate permissions** list, select **Certificate Management Operations** and **Privileged Certificate Operations**.
 - Next to the **Select principal** label, click **None selected**, browse the CCKM app, and select it.
4. Click **Add**.

Azure Role-based Access Control

1. Access **Key vaults** > **{Key Vault Name}** > **Access control (IAM)**. The right pane provides options to view your existing level of access, assign a role, and view access to the vault.
2. Under **Grant access to this resource**, click **Add role assignment**.
3. On the **Roles** tab of the **Add role assignment** page, select **Key Vault Administrator**. Use the search field to search for the role.
4. Click **Next**.
5. On the **Members** tab, make sure that **Assign access to** is set to **User, group, or service principal**.
6. Click **+ Select members**.
7. On the right, in the **Select members** pane, select the desired CCKM app. Use the search field to search for your CCKM app. The **Selected members** section shows the selected app.
8. In the right pane, click **Select**.
9. (Optional) Provide a basic **Description** of the member.
10. Click **Next**.
11. Review the details. If the details are incorrect or you want to modify them, click **Previous** and update the details.

12. Click **Review + assign**. The selected role with desired permissions is assigned to the CCKM app.

Add Azure Connection on CipherTrust Manager

Before you can add an Azure vault to the CCKM, an Azure connection must already exist on the CipherTrust Manager. A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connections Management](#) for details.

Now, [Azure vaults](#) and [Azure keys](#) can be managed on the CipherTrust Manager.

Managing Azure Vaults

This section describes how to manage Azure vaults on CCKM.

Before proceeding, make sure to fulfill [prerequisites](#).

Adding Existing Vaults

To add an existing Azure vault to the CCKM:

1. Log on to the **CipherTrust Manager** GUI as administrator.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page is displayed.
4. Click **Add Existing Vault**. The Add Existing Key Vaults dialog box is displayed.
5. Select/enter the following details:
 - a. From the **Azure Connection** drop-down list, select the desired connection. Start typing to search for connections with a matching string in their names. The linked subscriptions are auto-populated in the **Subscription** drop-down list.
 - b. From the **Subscription** drop-down list, search and select the desired subscription. Start typing to search for subscriptions with a matching string in their names.
 - c. Select the vaults that you want to add to the CCKM.

To select a vault from an Azure Managed HSM pool:

- a. Select **Managed HSM**.
- b. Use the **Vault Name** check boxes to select vaults from an Azure Managed HSM pool.

To select an Azure vault:

- a. Make sure that **Managed HSM** is clear.

-
- b. Use the **Vault Name** check boxes to select Azure vaults.

6. Click **Save**. The Azure vault is added to the CCKM.

A message **vault added successfully...** is displayed on the screen.

Refreshing Azure Keys

Refreshing is the process of downloading keys created on the Azure vaults to CCKM. You can refresh keys from individual vaults or all vaults at once.

- [Refreshing Specific Vaults](#)
- [Refreshing All Vaults](#)

Refreshing Specific Vaults

To refresh keys of a specific vault:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page is displayed. This tab displays the list of Azure key vaults.
3. Click the overflow icon () corresponding to the desired Azure vault and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen.

After successful refresh, the refreshed keys are listed on the **Cloud Keys > Azure > Azure Keys** page. Refer to [Viewing Azure Keys](#) for details.

Refreshing All Vaults

To refresh keys of all vaults:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page is displayed. This tab displays the list of Azure key vaults.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all Azure Key Vaults is a time intensive operation that could take several hours or days to complete. It will continue running in the background. Do you want to continue?

4. Click **Refresh All** to continue.
-

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

After successful refresh, the refreshed keys are listed on the **Cloud Keys > Azure > Azure Keys** page. Refer to [Viewing Azure Keys](#) for details.

Viewing/Editing Details of Azure Vaults

Viewing Azure Vaults Details

The Vaults tab of the Azure Key Vaults page shows the list of existing Azure key vaults. Search for the key vaults by Vault Name, Subscription ID, or Subscription Name.

To view the details of Azure vaults:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page displays the following details.

Column	Description
Name	Name of the Azure vault.
Last Refreshed	Time when the vault was last refreshed.
Connection	Name of the connection.
Cloud	Cloud name.
Managed HSM	Whether the vault is inside an Azure Managed HSM pool.
Location	Location in which the vault is added.
SKU	Pricing Tier information of the vault.
Subscription Name	Name of the subscription.
Subscription ID	ID of the subscription.
Vault Type	Type of the Azure key vault. The type can be Standard, Premium, or ManagedHSM.
Schedule Name	Name of the key rotation schedule.
Frequency	Frequency of the key rotation.
Next Rotation Date	Date when the next key rotation will happen.
Vault URI	URI of the Azure vault. By default, this column is not visible. Click the Customize View (⚙️) icon, select Vault URI , and click OK to display the column.

Modifying Azure Vault Details

To edit the details of an Azure vault:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page displays the list of added Azure vaults.
3. Click the overflow icon () corresponding to the desired Azure vault and click **View/Edit Details**.

You can modify the user permission and the Azure connection linked with the Azure vaults. Refer to the following sections:

- [Managing User Permissions on Azure Vaults](#)
- [Changing the Azure Connection](#)

Adding/Editing Rotation Schedules

Adding a Rotation Schedule to an Azure Vault

To add a rotation schedule to an Azure vault.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page displays the list of added Azure vaults.
3. Click the overflow icon () corresponding to the desired Azure vault and click **Add/Edit Schedule**. The Add Schedule to Vault wizard is displayed.

Note

If a rotation schedule is not already added to the vault, then the Add Schedule to Vault wizard is displayed.

4. Select the desired **Rotation Schedule** from the drop-down list.
5. Select **Schedule Setting**. You can select either **Ignore Keys With Schedules** or **Override Existing Key Schedules**.
6. Click **Save**.

Alternatively, you can do the following.

1. Click the desired Azure vault from the list of Azure vaults. The Azure Vault Detail screen is displayed.

2. Go to **KEY SCHEDULE** section and select the desired **Rotation Schedule** from the drop-down list.
3. Select **Schedule Setting**. You can select either **Ignore Keys With Schedules** or **Override Existing Key Schedules**.
4. Click **Update**.

Refer to [Scheduling Operations](#) for more details.

Editing an Existing Rotation Schedule of an Azure Vault

To edit an existing rotation schedule of an Azure vault.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page displays the list of added Azure vaults.
3. Click the overflow icon () corresponding to the desired Azure vault and click **Add/Edit Schedule**. The Edit Schedule to Vault wizard is displayed.

Note

If a rotation schedule is already added to the vault, then the Edit Schedule to Vault wizard is displayed.

4. Change **Rotation Schedule** from the drop-down list.
5. Select **Schedule Setting**. You can select either **Ignore Keys With Schedules** or **Override Existing Key Schedules**.
6. Click **Save**.

Alternatively, you can do the following.

1. Click the desired Azure Vault from the list of the added Azure vaults. The Azure Vault Detail screen is displayed.
2. Go to **KEY SCHEDULE** section and change **Rotation Schedule** from the drop-down list.
3. Select **Schedule Setting**. You can select either **Ignore Keys With Schedules** or **Override Existing Key Schedules**.
4. Click **Update**.

Refer to [Scheduling Operations](#) for more details.

Managing User Permissions on Azure Vaults

To work with Azure, users/group must have the minimum set of permissions that allow them to use the Azure resources such as Azure keys, vaults, secrets, certificates, and reports. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on the Azure vault. Refer to [User Roles](#) for details.

User permissions for Azure resources can be configured on the **Vault Access Control** section of the Azure vault details page.

To add permission for user/group:

1. In the **Vault Access Control** section, click **Assign User/Group**.
2. On the **Assign User/Group** screen, select the user or group to be assigned permissions from the **User/Group** drop-down list.
3. Click **Save**.

The newly added user/group is displayed under **Name** in the **Vault Access Control** section.

Note

Use the Keys, Certificates, Secrets, and Reports tabs to specify permissions for keys, certificates, secrets, and reports. These tabs display the operations allowed on the Azure vaults.

Note

Depending on the type of the Azure vault, a key is deleted differently.

- **Vault with Soft-Delete Enabled:** To delete the key permanently, perform the **Soft Delete** and the **Purge** operations on the key. However, for this operation to be successful, the user must have the **Soft Delete Key** and the **Purge Key** access.
- **Vault with Soft-Delete Disabled:** To delete the key permanently, use the Delete option. However, for this operation to be successful, the user must have the **Soft Delete Key** access.

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. Select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing a Permission

To remove a permission assigned to a user or group:

1. Clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. Under **Unassign**, click the **X** button corresponding to the desired user/group.
2. On the **Unassign User / Unassign Group** screen, click **Unassign**.

Note

Unassigning this user/group will remove all permissions currently assigned to the user/group. Are you sure you want to continue?

3. Click **Unassign**.

A message **Updated access control for this key vault** is displayed on the screen.

Changing the Azure Connection

To change the connection linked with the Azure vault:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page displays the list of added Azure vaults.
3. Click the overflow icon () corresponding to the desired Azure vault and click **View/Edit Details**.

4. Expand the **GENERAL INFO** section.
5. From the **Azure Connection** drop-down list, select the desired connection.
6. Click **Update**.

Deleting Azure Key Vaults

To delete an Azure key vault:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page displays the list of added Azure vaults.
3. Click the overflow icon () corresponding to the desired Azure vault and click **Delete**.
4. On the **Delete Azure Key Vault** screen, select **Delete Azure Key Vault**.

A message **Azure Vault deleted** is displayed on the screen.

Warning

Be extremely careful when deleting an Azure vault. Once the Azure vault is deleted, it will no longer be available for use.

Managing Azure Keys

This section describes how to manage Azure keys on CCKM. Before proceeding, you must have an Azure key vault added to the CCKM. Refer to [Managing Azure Vaults](#) for details.

Adding Azure Keys

CCKM provides two methods to add Azure keys:

- **Creating/Uploading New Key Material:** Add key material by creating and uploading new source key or creating new native key.
- **Cloning Existing Key Material:** Clone key material from an existing key to create a new key.

Creating/Uploading New Key Material

To add an Azure key by creating/uploading new key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.

-
3. Click **Add Key**. The Select Material Origin screen of the Add Azure Key wizard is displayed.
 4. Under **Select Method**, select **Create/Upload New Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following:
 - CipherTrust (External)
 - CipherTrust (Local)
 - Microsoft Azure (Native)
 - Luna HSM
 - Vormetric DSM

Uploading CipherTrust (External) Key Material

Upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin

1. Select **CipherTrust (External)**.
2. Click **Next**. The Configure Source Key screen is displayed.

Configure CipherTrust (External) Key

1. **Select Domain** from the drop-down list.
 2. Enter a **Key Name**.
 3. Select the **Key Size** from the available options. The supported sizes are 2048, 3072, and 4096.
1. Click **Next**.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key. By default, the Key Name specified on the previous screen is populated.
2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
3. Select the **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For vaults inside an Azure Managed HSM pool, the key type is **RSA HSM**.
 - For a premium vault, the key type can be **RSA** or **RSA HSM**.

4. (Optional) Set the key activation and expiration dates.

- Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
- Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.

5. (Optional) Select the **Enable Key** check box.6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

```
{
  "anyOf": [
    {
      "allof": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ],
      "authority": "https://sharedeus.eus.attest.azure.net/"
    },
    {
      "allof": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ],
      "authority": "https://sharedwus.wus.attest.azure.net/"
    }
  ]
}
```

```

    },
    {
      "allof": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ],
      "authority": "https://sharedneu.neu.attest.azure.net/"
    },
    {
      "allof": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ],
      "authority": "https://sharedweu.weu.attest.azure.net/"
    },
    {
      "allof": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ],
      "authority": "https://sharedeus2.eus2.attest.azure.net/"
    }
  ],
  "version": "1.0.0"
}

```

7. Select the **Key Attributes**. The supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; . ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Native (Azure)**: Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
 - **Luna**: HSM Luna. Also select a **Partition**.
 - **DSM**: Vormetric Data Security Manager. Also select a **Domain**.
3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.

-
5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **CCKM**.

Uploading CipherTrust (Local) Key Material

Upload the local key material using CipherTrust to configure source key.

Select Material Origin

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Configure Source Key screen is displayed.

Configure CipherTrust (Local) Key

1. Enter a **Key Name**.
2. Select the **Key Size** from the available options. The supported sizes are 2048, 3072, and 4096.
3. Click **Next**.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key. By default, the Key Name specified on the previous screen is populated.
 2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types
-

specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.

3. Select the **Key Type**.

- For a standard vault, the key type is **RSA**.
- For vaults inside an Azure Managed HSM pool, the key type is **RSA HSM**.
- For a premium vault, the key type can be **RSA** or **RSA HSM**.

4. (Optional) Set the key activation and expiration dates.

- Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
- Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.

5. (Optional) Select the **Enable Key** check box.

6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

```
{
  "anyOf": [
    {
      "allOf": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ],
      "authority": "https://sharedeus.eus.attest.azure.net/"
    },
    {
      "allOf": [
        {
```

```

        "claim": "x-ms-attestation-type",
        "equals": "sevsnpvm"
      },
      {
        "claim": "x-ms-compliance-status",
        "equals": "azure-compliant-cvm"
      }
    ],
    "authority": "https://sharedwus.wus.attest.azure.net/"
  },
  {
    "allof": [
      {
        "claim": "x-ms-attestation-type",
        "equals": "sevsnpvm"
      },
      {
        "claim": "x-ms-compliance-status",
        "equals": "azure-compliant-cvm"
      }
    ],
    "authority": "https://sharedneu.neu.attest.azure.net/"
  },
  {
    "allof": [
      {
        "claim": "x-ms-attestation-type",
        "equals": "sevsnpvm"
      },
      {
        "claim": "x-ms-compliance-status",
        "equals": "azure-compliant-cvm"
      }
    ],
    "authority": "https://sharedweu.weu.attest.azure.net/"
  },
  {
    "allof": [
      {
        "claim": "x-ms-attestation-type",
        "equals": "sevsnpvm"
      },
      {
        "claim": "x-ms-compliance-status",

```

```

        "equals": "azure-compliant-cvm"
      }
    ],
    "authority": "https://sharedeus2.eus2.attest.azure.net/"
  }
],
"version": "1.0.0"
}

```

7. Select the **Key Attributes**. The supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.

2. Select the **Key Origin** from the available options. The key origin can be:

- **CipherTrust**: CipherTrust Manager.
- **Native (Azure)**: Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
- **Luna**: HSM Luna. Also select a **Partition**.
- **DSM**: Vormetric Data Security Manager. Also select a **Domain**.

3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.

5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **CCKM**.

Creating Microsoft Azure (Native) Key Material

Create the Azure key material directly using the native Microsoft Azure application.

Select Material Origin

1. Select **Microsoft Azure (Native)**.

2. Click **Next**. The Configure Source Key screen is displayed.

Configure Source Key

-
1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key.
 2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
 3. Select the **Key Type**.
 - For a standard vault, the key type can be **RSA** or **Elliptic Curve**.
 - For vaults inside an Azure Managed HSM pool, the key type can be **RSA HSM** or **Elliptic Curve HSM**.
 - For a premium vault, the key type can be **Elliptic Curve**, **Elliptic Curve HSM**, **RSA**, or **RSA HSM**.
 4. (Applicable to **RSA** or **RSA HSM** key types) Select **Size** from the following options: 2048, 3072, and 4096.
 5. (Applicable to **Elliptic Curve** or **Elliptic Curve HSM** key types) Select **Curve** from the following options: P-256, P-384, P-521, and SECP256K1.
 6. (Optional) Set the key activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.
 7. (Optional) Select the **Enable Key** check box.
 8. Select the **Key Attributes**.

If the Key Type is **RSA** or **RSA HSM**, the supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

If the Key Type is **Elliptic Curve** or **Elliptic Curve HSM**, the supported attributes are:

- Sign
- Verify

9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:

- Alphanumeric characters
- Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`

c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**.

The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Native (Azure)**: Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
 - **Luna**: HSM Luna. Also select a **Partition**.
 - **DSM**: Vormetric Data Security Manager. Also select a **Domain**.
3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.
5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, NATIVE KEY and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **NATIVE KEY** and **KEY SCHEDULES** section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the **NATIVE KEY** and **KEY SCHEDULES** sections becomes **Complete** and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **Native**.

Uploading Luna HSM Key Material

Upload the key material using Luna HSM to configure source key.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Select Material Origin

1. Select **Luna HSM**.
2. Click **Next**. The Configure Source Key screen is displayed.

Configure Source Key

1. Enter a **Luna HSM Key Label**.
2. Select the **Partition ID** of the desired Luna HSM.
3. Select the key **Mechanism**. The supported key mechanisms are:
 - CKM_RSA_FIPS_186_3_AUX_PRIME_KEY_PAIR_GEN
 - CKM_RSA_X9_31_KEY_PAIR_GEN
 - CKM_RSA_FIPS_186_3_PRIME_KEY_PAIR_GEN
 - CKM_RSA_PKCS_KEY_PAIR_GEN
4. Select the **Key Size** from the available options. The supported sizes are 2048, 3072, and 4096.
5. Select the **Key Attributes**. The options are:
 - Encrypt, Decrypt, Wrap, Unwrap

- Sign, Verify, Derive

6. Click **Next**.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key. By default, the Key Name specified on the previous screen is populated.
2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
3. Select the **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For a premium vault, the key type can be **RSA** or **RSA HSM**.
4. (Optional) Set the key activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.
5. (Optional) Select the **Enable Key** check box.
6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

```
{
  "anyOf": [
    {
      "allof": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ]
    }
  ]
}
```

```

        }
    ],

```

7. Select the **Key Attributes**. The supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `**!@#$%)({}><?+ - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.

- **Native (Azure):** Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
- **Luna:** HSM Luna. Also select a **Partition**.
- **DSM:** Vormetric Data Security Manager. Also select a **Domain**.

3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.

5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY** and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **CCKM**.

Uploading Vormetric DSM Key Material

Upload the key material using Vormetric DSM to configure source key.

Select Material Origin

-
1. Select **Vormetric DSM**.
 2. Click **Next**. The Configure Source Key screen is displayed.

Configure Source Key

1. Enter a **DSM Key Name**.
2. (Optional) Provide a basic **Description** of the key.
3. Select the desired **DSM Domain**.
4. (Optional) Set the key expiration date. Select the **Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.
5. Select the key **Algorithm**. The supported algorithms are:
 - RSA-4048
 - RSA-3072
 - RSA-4096
6. Click **Next**.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key. By default, the Key Name specified on the previous screen is populated.
 2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
 3. Select the **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For a premium vault, the key type can be **RSA** or **RSA HSM**.
 4. (Optional) Set the key activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.
 5. (Optional) Select the **Enable Key** check box.
 6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.
-

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

```
{

    }
],
"version": "1.0.0"
}

```

7. Select the **Key Attributes**. The supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.

- CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`

c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Native (Azure)**: Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
 - **Luna**: HSM Luna. Also select a **Partition**.
 - **DSM**: Vormetric Data Security Manager. Also select a **Domain**.
3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.

5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as

appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **CCKM**.

Cloning Existing Key Material

To add a new Azure key by cloning existing key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click **Add Key**. The Select Material Origin screen of the Add Azure Key wizard is displayed.
4. Under **Select Method**, select **Clone Existing Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following:
 - CipherTrust (External)
 - CipherTrust (Local)
 - Luna HSM
 - Vormetric DSM

Cloning CipherTrust (External) Key Material

Upload the key material of an external CipherTrust Manager key using CipherTrust to configure source key.

Select Material Origin

1. Select **CipherTrust (External)**.
2. Click **Next**. The Select CipherTrust Key screen is displayed.

Select CipherTrust (External) Key

1. Select a **Domain** from the drop-down list. This field displays the domains of the external CipherTrust Manager.
2. Select the desired **Key Size**. The options are 2048, 3072, and 4096.

3. Select a **CipherTrust (External) Key** from the list. The list displays the keys of the selected domain of the external CipherTrust Manager.
4. Click **Next**. The Configure Destination (Azure) Key screen is displayed.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key.
2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
3. Select the **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For a premium vault, the key type can be **RSA** or **RSA HSM**.
4. (Optional) Set the key activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.
5. (Optional) Select the **Enable Key** check box.
6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

```
{
  "anyOf": [
    {
      "allOf": [
        {
          "claim": "x-ms-attestation-type",
          "equals": "sevsnpvm"
        },
        {
          "claim": "x-ms-compliance-status",
          "equals": "azure-compliant-cvm"
        }
      ]
    }
  ]
}
```

```

        }
    ],
    "authority": "https://sharedeus.eus.attest.azure.net/"

                "equals": "sevsnpvm"
            },
            {
                "claim": "x-ms-compliance-status",
                "equals": "azure-compliant-cvm"
            }
        ],
        "authority": "https://sharedeus2.eus2.attest.azure.net/"
    },
    "version": "1.0.0"
}

```

7. Select the **Key Attributes**. The supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `**!@#$%)( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.

- **Native (Azure):** Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
- **Luna:** HSM Luna. Also select a **Partition**.
- **DSM:** Vormetric Data Security Manager. Also select a **Domain**.

3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.

5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY and KEY SCHEDULES section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is CCKM.

Cloning CipherTrust (Local) Key Material

Upload the local key material using CipherTrust to configure source key.

Select Material Origin

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Select CipherTrust Key screen is displayed.

Select CipherTrust (Local) Key

1. Select the desired **Key Size**. The options are 2048, 3072, and 4096.
2. Select a **CipherTrust (Local) Key** from the list. The list displays the keys of the selected domain of the local CipherTrust Manager.
3. Click **Next**. The Configure Destination (Azure) Key screen is displayed.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key.
2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
3. Select the **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For a premium vault, the key type can be **RSA** or **RSA HSM**.
4. (Optional) Set the key activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.
5. (Optional) Select the **Enable Key** check box.
6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

```
{
  "anyOf": [
    {
      "allOf": [
```

```

        {
            "claim": "x-ms-attestation-type",
            "equals": "sevsnpvm"
        },
        {
            "claim": "x-ms-compliance-status",
            "equals": "azure-compliant-cvm"
        }
    ],
    "authority": "https://sharedeus.eus.attest.azure.net/"
},
{
    "allof": [
        {
            "claim": "x-ms-attestation-type",
            "equals": "sevsnpvm"
        },
        {
            "claim": "x-ms-compliance-status",
            "equals": "azure-compliant-cvm"
        }
    ],
    "authority": "https://sharedwus.wus.attest.azure.net/"
},
{
    "allof": [

      }
    ],
    "authority": "https://sharedeus2.eus2.attest.azure.net/"
  }
],
"version": "1.0.0"
}

```

7. Select the **Key Attributes**. The supported attributes are:

- Encrypt, Decrypt, Sign
- Verify, Wrap Key, Unwrap Key

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : . ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. Select **Rotation Schedule**.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust**: CipherTrust Manager.
 - **Native (Azure)**: Native Microsoft Azure application. Also select the Key Type - **RSA** or **EC**.
 - **Luna**: HSM Luna. Also select a **Partition**.
 - **DSM**: Vormetric Data Security Manager. Also select a **Domain**.
3. Select a **Key Size**.

Note

When the key origin is native Azure, select a curve for Elliptic Curve or Elliptic Curve HSM key types.

4. (Optional) Select the **Enabled** check box to enable the key.
5. Click **Next**.

The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY and KEY SCHEDULES section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **CCKM**.

Cloning Luna HSM Key Material

Upload the key material using Luna HSM to configure source key.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Select Material Origin

1. Select **Luna HSM**.
2. Click **Next**. The Select Luna HSM Key screen is displayed.

Select Luna HSM Key

1. Select the desired **Key Size**. The options are 2048, 3072, and 4096.
2. Select an **HSM Key** from the list. The list displays the keys of the selected domain of the external CipherTrust Manager.
3. Click **Next**. The Configure Destination (Azure) Key screen is displayed.

Configure Destination (Azure) Key

1. Enter a user-friendly alias as the **Azure Key Name**. This helps uniquely identify a key.
2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
3. Select the **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For a premium vault, the key type can be **RSA** or **RSA HSM**.
4. (Optional) Set the key activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the key.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the key expiration date and time.

5. (Optional) Select the **Enable Key** check box.
6. (Optional, applicable to premium Azure vaults and vaults stored in an Azure Managed HSM pool) Select the **Exportable** check box to enable Confidential Computing.

When you select **Exportable**, the Release Policy text box is displayed. In this text box, specify or paste the release policy in the JSON format. A release policy specifies the policy rules under which the key can be exported. The release policy must be specified when creating the first version of an exportable key.

A sample release policy is displayed below.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Azure Key wizard is closed.

The newly created key is displayed in the list of Azure keys. The origin of the key is **CCKM**.

Viewing Azure Keys

Search for Azure keys by Key Name, Key Vault, or Tags.

CCKM does not allow searching for keys:

- By tag values using colon (:)
 - By "key:value" pair using these characters:

\ , : " %

To view an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed. The Azure Keys page displays the following details:

Field	Description
Key Name	Unique, user-friendly alias of the key. This is useful

Field	Description
	in searching for specific keys.
Current Version	Current version of the key. Click the expand icon () corresponding to a key to view its versions.
Key Vault	Name of the Azure key vault.
Key State	State of the key. The status can be Enabled or Disabled. Click the filter icon () to view the list of Enabled or Disabled keys.
Region	Azure region where the key is created. Click the filter icon () to view the list of supported Azure regions.
Status	State of the key. The status can be: • Available • Soft Deleted • Deleted
Algorithm	Name of the algorithm. Supported algorithms are: • EC • RSA • EC-HSM • RSA HSM
Origin	Source of the key material. The origin of the key can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud.
Cloud	Name of the cloud. Supported clouds are: • Azure Cloud • Azure China Cloud • Azure German Cloud • Azure US Government • Azure Stack
Backup	State of the backup of the key. If the backup of the key exists, the backup icon becomes visible.
Creation Date	Time when the key is created.

Sometimes, you might notice certain keys are displayed as grayed out. This happens when the keys are no longer accessible. For example, when:

- Any cloud permissions on the keys are changed. The keys are no longer accessible from the Azure connection.
- Connection is changed in KMS. The new connection does not have permissions to access the keys.

Editing Azure Keys

To view or edit an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **View/Edit**.
4. Configure the **KEY SCHEDULES** and manage the **BACKUPS**. Refer to [KEY SCHEDULES](#) and [BACKUPS](#) for details.

KEY SCHEDULES

To configure the key schedules, go to the KEY SCHEDULES section and select/enter the following details:

1. From the **Select Rotation Schedule** drop-down list, select a rotation schedule.
2. Select the key origin. The available options are CipherTrust (External), CipherTrust (Local), Native (Azure), Luna, and DSM.

Click the desired tab to view the instructions.

CipherTrust (Local)

- a. Select the **Key Type**. The available options are RSA and RSA-HSM.
- b. Select the **Key Size**. The available options are 2048, 3072, and 4096.

Native (Azure)

- a. Select the **Key Type**. The available options are RSA, EC, RSA-HSM, and EC-HSM.
- b. select the **Elliptical Curve Name**. The available options are P-56, P-384, P-521, and SECP256K1.

CipherTrust (External)

- a. Select the **Key Type**. The available options are RSA and RSA-HSM.
- b. Select the **Key Size**. The available options are 2048, 3072, and 4096.

Luna

- a. Select the Partition.

-
- b. Select the **Key Type**. The available options are RSA and RSA-HSM.
 - c. Select the **Key Size**. The available options are 2048, 3072, and 4096.

DSM

- a. Select the Domain.
 - b. Select the **Key Type**. The available options are RSA and RSA-HSM.
 - c. Select the **Key Size**. The available options are 2048, 3072, and 4096.
3. Select **Enabled** if you want to enable the rotated key.
 4. Click **Update**.

A message **Key schedule updated successfully** is displayed on the screen.

To select the Key backup schedule.

1. From the **Select Backup Schedule** drop-down list, select a backup schedule.
2. Click **Update**.

BACKUPS

This section allows you to perform the following operations.

- View all the backups of the Azure key.
- Restore a service backup.
- Retrieve the latest service backup date
- Backup the Azure key.
- Restore the backups of the Azure key.
- Delete the backups of the Azure key.
- Delete multiple backups of the Azure key.
- Delete multiple backups of the Azure key by date.

To restore the service backup.

1. Click the overflow icon () corresponding to the Service Backup and click **Restore Backup**. The Restore Backup dialog box is displayed.
2. Click **Restore Backup**.

To view the latest backup date of the Service, click the **Refresh** icon to the left the Service Backup.

To backup the Azure key.

1. Click **Backup Now**. The Backup Now dialog box is displayed.
2. (Optional) Enter the **Backup Name**.
3. (Optional) Enter the **Description**.

Note

- The CCKM Users should have Add Key or Upload Key permissions. To add the permission in the vault, refer to [Managing User Permissions on Azure Vaults](#).
- Backup Now is the manual creation of a cloud key's backup.
- **Backup Limit:**
 - The default backup limit is 30.
 - You can change the limit at the domain level using the [Updating CCKM Settings API](#). The limit will be applicable to all the vaults in the domain.
 - You can change the limit at the vault level using the [Adding Azure Vaults](#) or [Updating Azure Vaults](#) APIs. The limit will apply to that particular vault.
 - If you have changed the limit at both levels, the changes made at the vault level will be applicable.
 - If the total Scheduled + Manual Backups exceed the maximum allowance, older backups will automatically be deleted.

To restore the backup of the Azure key.

4. Click the overflow icon () corresponding to the desired backup and click **Restore Backup**. The Restore Backup dialog box is displayed.
5. Click **Restore Backup**.

To delete the backup of the Azure key.

1. Click the overflow icon () corresponding to the desired backup and click **Delete Backup**. The Delete Backup dialog box is displayed.
2. Click **Delete Backup**.

To delete multiple backups of the Azure key.

1. Select the desired backups from the list to delete.

Note

If you want to delete all the backups, select **All**.

2. Click **Delete Selected**. The Delete Backups dialog box is displayed.
3. Click **Delete Backup**.

To delete multiple backups of the Azure key by date.

1. Click **Delete Backup by Date**. The Delete Backup by Date dialog box is displayed.
2. Select the date range, **From Date** and **To Date**.
3. Click **Delete Backups**.

Refreshing Azure Keys

Refreshing is the process of downloading keys created on the Azure key vault to CCKM.

Note

If the key vault of the key has been deleted from the Azure Portal and refreshed on CCKM, the key cannot be refreshed and restored. To refresh and restore the key, create a new key vault on the Azure Portal, in the same region with the same name, and refresh it on CCKM.

Refreshing All Keys

Keys from all key vaults can be refreshed at once. To refresh all the Azure keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Keys** tab. The list of available Azure keys is displayed.
4. Click **Refresh**. The **This may take a while...** message is displayed.

Note

Refresh is a time intensive operation that could take several hours or days to complete. It will continue

running in the background. Do you want to continue?

5. Click **Refresh** to continue.

A message **Refresh started...** is displayed on the screen. The refreshed keys are listed on the **Cloud Keys > Azure > Keys** tab.

To cancel the refresh:

1. Click **Cancel Refresh**. The **Cancel Refresh?** message is displayed. The action will terminate all currently active refresh operations. All progress will be lost and this action cannot be undone. Do you want to proceed to cancel refresh or cancel this action?
2. Click **Cancel Refresh**.

A message **Canceled Refresh** is displayed on the screen.

Refreshing a Desired Key

You can refresh a desired key from the list. To refresh an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the overflow icon () corresponding to the desired alias and click **Refresh**.

A message **Key refreshed successfully.** is displayed on the screen.

Disabling Keys and Versions

You can disable the Azure keys and key versions.

Disabling Keys

If required, you can disable an enabled key. A disabled key cannot operate on data. To disable an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the overflow icon () corresponding to the desired key and click **Disable**. The Confirm Disable Key dialog box is displayed.
4. Click **Disable**.

A confirmation message is displayed on the screen. The Key State changes to **Disabled**.

Disabling Key Versions

If required, you can disable an enabled version of a key. A disabled version cannot operate on data. To disable an Azure key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired version.
5. Click **Disable**. The Confirm Disable Version dialog box is displayed.
6. Click **Disable**.

A confirmation message is displayed on the screen. The Key State changes to **Disabled**.

Enabling Keys and Versions

You can enable the Azure keys and key versions.

Enabling Keys

If required, you can enable a disabled key. To enable an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the overflow icon () corresponding to the desired key and click **Enable**. The Confirm Enable Key dialog box is displayed.
4. Click **Enable**.

A confirmation message is displayed on the screen. The Key State changes to **Enabled**.

Enabling Key Versions

If required, you can enable a disabled version of a key. To enable an Azure key version:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Cloud Keys > Azure**.
 3. Click the expand icon () to the left of the desired key.
 4. Click the overflow icon () corresponding to the desired version.
 5. Click **Enable**. The Confirm Enable Version dialog box is displayed.
-

6. Click **Enable**.

A confirmation message is displayed on the screen. The Key State changes to **Enabled**.

Rotating Keys (Add Version)

Note

To rotate Azure keys, **CCKM Users** require **Add Key** and **Upload Key** permissions.

To rotate a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Rotate Now (Add Version)**. The Add New Version screen is displayed.
4. Select Key Material Origin. Depending on your requirements, select an appropriate option. Refer to the following sections for details:
 - [Creating/Uploading New Key Material](#)
 - [Cloning Existing Key Material](#)

A message **Azure Key successfully rotated** is displayed on the screen. Navigate to **Cloud Keys > Azure > View/Edit > Versions** to view the versions of the rotated Azure key.

Deleting Azure Keys

Non-soft-delete keys can be deleted directly from the Azure vaults using CCKM.

To delete an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Delete**. The Confirm Delete dialog box is displayed.
4. Click **Delete**.

A confirmation message is displayed on the screen. The key status changes to **DELETED**.

Soft-Deleting Azure Keys

Soft deleting is the process of deleting Azure keys from the Azure vaults and CCKM. These keys still exist on CCKM and in the Azure vaults. The soft-deleted keys can be recovered.

Note

This operation can be performed only on the Azure keys residing in the soft-enabled key vaults.

To soft-delete an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Soft Delete**. The Confirm Soft Delete dialog box is displayed.
4. Click **Soft Delete**.

A message **key <key name> soft-deleted** is displayed on the screen. The status of the key changes to **SOFT-DELETED**.

Recovering Soft-Deleted Azure Keys

If needed, you can recover a soft-deleted key.

To recover a soft-deleted Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Recover Soft Delete**. The Confirm Recover Key dialog box is displayed.
4. Click **Recover Key**.

A message **Key <key name> recovered from soft-delete.** is displayed on the screen. The status of the key changes to **AVAILABLE**.

Purging Azure Keys

Purging is the process of permanently deleting soft-deleted Azure keys from the Azure vaults. However, backup of the purged key can be restored on CCKM. If you wish to restore backup of the purged key, follow the steps mentioned in the [Restoring Backup](#) section.

Note

This operation can be performed only on the soft-deleted Azure keys residing in the soft-enabled key vaults.

To purge an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Purge**. The Purge Azure Key dialog box is displayed.
4. Select the **I wish to purge this key.** check box.
5. Click **Purge Key**.

Purging a key might take some time. After successful deletion, a message **key <key name> hard deleted** is displayed on the screen. The status of the key changes to **DELETED**.

If needed, you can restore a purged key from its backup. Refer to [Restoring Backup](#) for details.

Backing Up Azure Keys

Warning

- The Physical and Virtual storage appliances have storage limits. Ensure that you have sufficient storage before enabling scheduled backup.
- If you do have sufficient storage, you can extend the storage, refer to [Resizing the Virtual Hard Disk After Deployment](#) for details.

To backup an Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Backup Now**. The Backup Now dialog box is displayed.

Note

Backup Now is the manual creation of a cloud key's backup.

4. (Optional) Enter the **Backup Name**.
5. (Optional) Enter the **Description**.
6. Click **Backup**.

A message **Backup created successfully for key <key name>** is displayed on the screen.

Restoring Service Backup

To restore a purged Azure key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Restore Service Backup**. The Confirm Restore Key dialog box is displayed.
4. Select the desired key vault from the **Select Vault** drop-down list.

Note

- Restoration of keys among cross-region vaults is not allowed.

5. Click **Restore**.

A message **Key <key name> restored** is displayed on the screen. The key is restored to the selected key vault. The key status changes to **AVAILABLE**.

Deleting Backup

Deleting a backup permanently removes the backup of a deleted Azure key from CCKM.

Note

This operation can be performed only on keys with a **DELETED** status. You can [delete](#) or [purge](#) keys to change their status to **DELETED**.

To delete the backup of an Azure key from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Delete Backup**. The Hard Delete Azure Key dialog box is displayed.
4. Select the **I wish to delete the backup of this key.** check box.
5. Click **Delete Key Backup**.

A message **Key <key name> backup deleted** is displayed on the screen. The backup of the key is permanently deleted from CCKM.

Downloading Keys and Versions

Asymmetric RSA/RSA-HSM keys and their older versions with the status AVAILABLE can be downloaded to your local machines. Other keys cannot be downloaded.

Downloading Keys

To download an AVAILABLE asymmetric RSA/RSA-HSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the overflow icon () corresponding to the desired key and click **Download Key**. The key is downloaded.

Downloading Key Versions

To download an older version of an AVAILABLE asymmetric RSA/RSA-HSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The list of available Azure keys is displayed.
3. Click the expand icon () corresponding to the desired key. The Older Versions are displayed.
4. Click the overflow icon () corresponding to the desired key version and click **Download Key**. The key version is downloaded.

Alternatively, click the key link under the Key Name field to view the key details. Scroll down to the VERSIONS section.

Note

If an exportable Luna HSM key is created on Azure cloud, and the synchronization operation is performed on CCKM, the Exportable field under VERSIONS does not show any value for the key.

Managing Azure Certificates

This section describes how to manage Azure certificates on CCKM. Before proceeding, you must have an Azure vault added to the CCKM. Refer to [Managing Azure Vaults](#) for details.

A CCKM User must have the following permissions on the CipherTrust Manager to perform operations on certificates:

- ReadLocalCA
- ReadCertificate
- UpdateSoftDeleteAzureCertificateCCKM
- UpdateHardDeleteAzureCertificateCCKM
- UpdateRecoverAzureCertificateCCKM
- RestoreAzureCertificateCCKM
- CreatAzureCertificateCCKM
- UploadAzureCertificateCCKM

Adding Azure Certificates

CCKM provides two methods to add Azure certificates:

- [Generating Certificate](#)
- [Importing Certificate](#)

Generating Certificate

To add an Azure Certificate by generating a certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab.
4. Click **Add Certificate**. The Select Material Origin screen of the Add Certificate wizard is displayed.

Select Material Origin

1. Under **Select Method**, select **Generate Certificate**.
2. Click **Next**. The Configure Certificate screen is displayed.

Configure Certificate

1. Enter **Certificate Name**.
2. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types can be Standard and Premium. Vaults stored in Azure Managed HSM pools are not supported.
3. Enter **Issuer Name**.
4. Enter **Subject**.
5. (Optional) Enter **DNS Name**.
6. (Optional) Enter **Validity Period (in months)**.
7. Select **Content Type** from the available options. The supported types are PKCSW12 and PEM.
8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; . ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Enable or disable **Advanced Configuration**.
 - Click **Yes** to enable.
 - Click **No** to disable.
10. Click **Next**. The Add Schedule screen is displayed.

Add Schedule

1. Under **Lifetime Action Type**, select either **Automatically Renew** or **Email Contacts**.
 - **Automatically Renew**: Azure generates a new key pair and updates the certificate automatically.
 - **Email Contacts**: Renewal notifications are sent to contacts configured in Azure (not managed in CCKM).
2. Under **Select Action**, select either **Percentage Lifetime** or **Number of Days Before Expiry**.
3. As per the selection above, enter the **Percentage** of Lifetime or **Days** Before Expiry.
4. Click **Next**. The Advanced Configuration screen is displayed.

Advanced Configuration

Note

To provide the Advance Configuration details, you need to enable **Advance Configuration** when providing the Certificate Configuration details.

1. (Optional) Enter **Extended Key Usages (EKUs)** separated by comma.
2. (Optional) Select **X509 Key Usage Flags** from the drop-down list.
3. Select **Key Type**.
 - For a standard vault, the key type is **RSA**.
 - For a premium vault, the key type is **EC (Elliptic Curve)**.
4. (Applicable to **RSA** key type) Select **Key Size** from the following options: 2048, 3072, and 4096.
5. (Applicable to **Elliptic Curve** key type) Select **Elliptic Curve Name** from the following options: P-256, P-384, P-521, and P-256K.
6. (Optional) Select the **Reuse Key on Renewal** check box.
7. (Optional) Select the **Exportable Private Keys** check box.
8. (Optional) Select the **Enable Certificate Transparency** check box.
9. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the certificate details that you have provided. These details are divided into MATERIAL ORIGIN, CONFIGURE CERTIFICATE, ADD SCHEDULE, and ADVANCED CONFIGURATION sections.

Before adding the certificate, review all details. After the certificate is added, certain features will no longer be editable.

1. Review the certificate details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **MATERIAL ORIGIN**, **CONFIGURE CERTIFICATE**, **ADD SCHEDULE**, and **ADVANCED CONFIGURATION** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Certificate**.

The certificate creation starts. A Create Certificate In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the MATERIAL ORIGIN, CONFIGURE CERTIFICATE, ADD SCHEDULE, and ADVANCED CONFIGURATION sections becomes Complete, the certificate is created successfully.

3. Click **OK**. The Add Certificate wizard is closed.

Importing Certificate

Note

A CCKM User must have the **ReadLocalCA** and **ReadCertificate** permissions on the CipherTrust Manager to import certificates.

To add an Azure Certificate by importing a certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab.
4. Click **Add Certificate**. The Select Material Origin screen of the Add Certificate wizard is displayed.

Select Material Origin

1. Under **Select Method**, select **Import Certificate**.
2. Click **Next**. The Configure Certificate screen is displayed. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types can be Standard and Premium. Vaults stored in Azure Managed HSM pools are not supported.

Import Certificate

1. Enter **Certificate Name**.
2. Select the desired **Vault** from the drop-down list. Vaults stored in Azure Managed HSM pools are not supported.

3. Select **CA ID**.
4. Select **Certificate Identifier**.
5. Upload **Private Key (pem file)**.
6. Enable or disable **Is Certificate File Password Protected?**.
 - Click **Yes** to enable.
 - Click **No** to disable.
7. Enter **Password**.

Note

If the **Is Certificate File Password Protected?** option is disabled, then you do not need to provide the password.

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the certificate details that you have provided. These details are divided into MATERIAL ORIGIN and CONFIGURE CERTIFICATE sections.

Before adding the certificate, review all details. After the certificate is added, certain features will no longer be editable.

1. Review the certificate details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the MATERIAL ORIGIN and CONFIGURE CERTIFICATE sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Certificate**.

The certificate creation starts. A Create Certificate In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the MATERIAL ORIGIN and CONFIGURE CERTIFICATE sections becomes Complete, the certificate is created successfully.

3. Click **OK**. The Add Certificate wizard is closed.

Viewing Azure Certificates

Search for Azure Certificates by Certificate Name, Certificate Vault, or Tags.

CCKM does not allow searching for certificates:

- By tag values using colon (:)
- By "certificate:value" pair using these characters:

\, : " %

To view an Azure certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed. The Azure Certificates tab displays the following details:

Field	Description
Certificate Name	Unique, user-friendly alias of the certificate. This is useful in searching for specific certificates.
Version ID	Current version of the certificate. Click the expand icon (▸) corresponding to a certificate to view its versions.
Status	State of the certificate. The status can be: • Available • Soft Deleted • Deleted
Origin	Source of the certificate material. The origin of the

Field	Description
	certificate can be: • CCKM: Certificate material is created on CCKM. • Native: Certificate material is created on the cloud. • External (Unknown): Source of the certificate material is unknown. It is different than CCKM and the native cloud.
Source	The source of the certificate.
Creation Date	Time when the certificate is created.
Expiry Date	Time when the certificate is created.
Key Vault	Name of the Azure key vault.
Region	Azure region where the certificate is created. Click the filter icon () to view the list of supported Azure regions.
Issuer Name	Name for the referenced issuer object or reserved names. Set to Self for a self-signed certificate.

Sometimes, you might notice certain certificates are displayed as grayed out. This happens when the certificates are no longer accessible. For example, when:

- Any cloud permissions on the certificates are changed. The certificates are no longer accessible from the Azure connection.
- Connection is changed in KMS. The new connection does not have permissions to access the certificates.

Editing Azure Certificates

To view or edit an Azure certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **View/Edit**.
5. Configure the **CERTIFICATE SCHEDULES**. Refer to [CERTIFICATE SCHEDULES](#) for details.

CERTIFICATE SCHEDULES

To configure certificate schedules:

1. In the **KEY SCHEDULES** section, select/enter the following details:
 - From the **Select Rotation Schedule** drop-down list, select a rotation schedule.
 - In the **Rotation Settings** section, select/enter the following details:
 - a. **Key Origin:** Select the key origin from the available options. The key origin can be CipherTrust, Native (Azure), Luna, or DSM.
 - b. (Applicable to Luna key origin) **Select Partition:** Select the Luna HSM partition.
 - c. **Key Type:** Select the key type. Key types differ based on the key origin.
 - For CipherTrust, Luna, and DSM, the supported key types are RSA and RSA-HSM.
 - For Native (Azure), the supported key types are RSA, EC, RSA-HSM, and EC-HSM.
 - d. Select the **Key Size** or **Elliptical Curve Name** depending on the selected Key Type.
 - If the key type is RSA or RSA-HSM, select **Key Size**. The available options are 2048, 3072, and 4096.
 - If the key origin is Native (Azure) and key type is EC or EC-HSM, select **Elliptical Curve Name**. The available options are P-56, P-384, P-521, and SECP256K1.
 - e. Select **Enabled** if you want to enable the rotated key.
2. Click **Update**.

A message **Key schedule updated successfully** is displayed on the screen.

Refreshing Azure Certificates

Refreshing is the process of downloading secrets created on the Azure key vault to CCKM. Certificates from all key vaults are refreshed at once.

To refresh certificates:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click **Refresh**. The **This may take a while...** message is displayed.

Note

Refresh is a time intensive operation that could take several hours or days to complete. It will continue running in the background. Do you want to continue?

5. Click **Refresh** to continue.

A message **Refresh started...** is displayed on the screen. The refreshed certificates are listed on the **Cloud Keys > Azure > Certificates** tab.

To cancel the refresh:

1. Click **Cancel Refresh**. The **Cancel Refresh?** message is displayed. The action will terminate all currently active refresh operations. All progress will be lost and this action cannot be undone. Do you want to proceed to cancel refresh or cancel this action?
2. Click **Cancel Refresh**.

A message **Refresh cancelled successfully** is displayed on the screen.

Rotating Certificates (Add Version)

Note

To rotate Azure Certificates, **CCKM Users** require **Add Certificate** and **Upload Certificate** permissions.

To rotate a certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Rotate Now (Add Version)**. The Select Material Origin screen of the Add New Version wizard is displayed.
5. Select Key Material Origin. Depending on your requirements, select an appropriate option. Refer to the following sections for details:
 - [Generating Certificate](#)
 - [Importing Certificate](#)

Soft-Deleting Azure Certificates

Soft deleting is the process of deleting Azure certificates from the Azure vaults and CCKM. These certificates still exist on CCKM and in the Azure vaults. The soft-deleted certificates can be recovered.

Note

This operation can be performed only on the Azure certificates residing in the soft-enabled key vaults.

To soft-delete an Azure certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Soft Delete**. The Confirm Soft Delete dialog box is displayed.
5. Click **Soft Delete**.

A message **Certificate <certificate name> soft-deleted** is displayed on the screen. The status of the certificate changes to **SOFT - DELETED**.

Recovering Soft-Deleted Azure Certificates

If needed, you can recover a soft-deleted certificate.

To recover a soft-deleted Azure certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Recover**. The Confirm Recover Certificate dialog box is displayed.
5. Click **Recover**.

A message **Certificate <certificate name> recovered from soft-delete.** is displayed on the screen. The status of the certificate changes to **AVAILABLE**.

Purging Azure Certificates

Purging is the process of permanently deleting soft-deleted Azure certificates from the Azure vaults. However,

backup of the purged certificate can be restored on CCKM. If you wish to restore backup of the purged certificate, follow the steps mentioned in the [Restoring Backup](#) section.

Note

This operation can be performed only on the soft-deleted Azure certificates residing in the soft-enabled key vaults.

To purge an Azure certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Purge**. The Purge Azure certificate dialog box is displayed.
5. Select the **I wish to purge this certificate.** check box.
6. Click **Purge Certificate**.

Purging a certificate might take some time. After successful deletion, a message **Certificate <certificate name> hard deleted** is displayed on the screen. The status of the certificate changes to **DELETED**.

If needed, you can restore a purged certificate from its backup. Refer to [Restoring Backup](#) for details.

Restoring Backup

To restore a purged Azure certificate:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Restore**. The Confirm Restore certificate dialog box is displayed.
5. Select the desired certificate vault from the **Select Vault** drop-down list.

Note

Restoration of certificates among cross-region vaults is not allowed.

6. Click **Restore Certificate**.

A message **Certificate <certificate name> restored** is displayed on the screen. The certificate is restored to the selected key vault. The certificate status changes to **AVAILABLE**.

Deleting Backup

Deleting a backup permanently removes the backup of a deleted Azure certificate from CCKM.

Note

This operation can be performed only on the certificates with **DELETED** status.

To delete the backup of an Azure certificate from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Certificates** tab. The list of available Azure certificates is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Delete Backup**. The Hard Delete Azure Certificate dialog box is displayed.
5. Select the **I wish to delete the backup of this certificate.** check box.
6. Click **Delete Certificate Backup**.

A message **Backup of Certificate <certificate name> deleted successfully** is displayed on the screen. The backup of the certificate is permanently deleted from CCKM.

Managing Azure Secrets

This section describes how to manage Azure Secrets on CCKM. Before proceeding, you must have an Azure key vault added to the CCKM. Refer to [Managing Azure Vaults](#) for details.

Adding Azure Secrets

To add an Azure Secret:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Cloud Keys > Azure**.
 3. Click the **Secrets** tab. The Add Secret wizard is displayed.
 4. Enter **Secret Name**.
-

5. Enter **Secret Value**.
6. Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types can be Standard and Premium. Vaults stored in Azure Managed HSM pools are not supported.
7. Enter **Content Type**.
8. (Optional) Set the secret activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the secret.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the secret expiration date and time.
9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.
 To add a tag:
 - a. Specify a tag name.
 - b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`
 - c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.
10. Click **Save**.

Viewing Azure Secrets

Search for Azure Secrets by Secret Name.

CCKM does not allow searching for secrets:

- By tag values using colon (:)
 - By "secret:value" pair using these characters:

`\ , : " %`

To view an Azure secret:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Secrets** tab. The list of available Azure secrets is displayed. The Azure Secrets tab displays the following details:

Field	Description
Secret Name	Unique, user-friendly alias of the secret. This is useful in searching for specific secrets.
Version ID	Current version of the secret. Click the expand icon () corresponding to a secret to view its versions.
Status	State of the secret. The status can be: • Available • Soft Deleted • Deleted
Cloud	Name of the cloud.
Creation Date	Date and time when the secret is created.
Expiry Date	Date and time when the secret will expire.
Key Vault	Name of the Azure key vault.
Region	Azure region where the secret is created. Click the filter icon () to view the list of supported Azure regions.

Sometimes, you might notice certain secrets are displayed as grayed out. This happens when the secrets are no longer accessible. For example, when:

- Any cloud permissions on the secrets are changed. The secrets are no longer accessible from the Azure connection.
- Connection is changed in KMS. The new connection does not have permissions to access the secrets.

Refreshing Azure Secrets

Refreshing is the process of downloading secrets created on the Azure key vault to CCKM. Secrets from all key vaults are refreshed at once.

To refresh secrets:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Secrets** tab. The list of available Azure secrets is displayed.

- Click **Refresh**. The **This may take a while...** message is displayed.

Note

Refresh is a time intensive operation that could take several hours or days to complete. It will continue running in the background. Do you want to continue?

- Click **Refresh** to continue.

A message **Refresh started...** is displayed on the screen. The refreshed secrets are listed on the **Cloud Keys > Azure > Secrets** tab.

To cancel the refresh.

- Click **Cancel Refresh**. The **Cancel Refresh?** message is displayed. The action will terminate all currently active refresh operations. All progress will be lost and this action cannot be undone. Do you want to proceed to cancel refresh or cancel this action?
- Click **Cancel Refresh**.

A message **Refresh cancelled successfully** is displayed on the screen.

Rotating Secrets (Add Version)

Note

To rotate Azure Secrets, **CCKM Users** require **Add Secret** and **Upload Secret** permissions.

To rotate a secret:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Cloud Keys > Azure**.
- Click the **Secrets** tab. The list of available Azure secrets is displayed.
- Click the overflow icon () corresponding to the desired alias and click **Rotate Now (Add Version)**. The Add New Version screen is displayed.
- Enter **Secret Value**.
- Select the desired **Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types can be Standard and Premium. Vaults stored in Azure Managed HSM pools are not supported.

7. Enter **Content Type**.
8. (Optional) Set the secret activation and expiration dates.
 - Select the **Set Activation Date** check box and from the on-screen calendar, select the date and time to activate the secret.
 - Select the **Set Expiration Date** check box and from the on-screen calendar, select the secret expiration date and time.
9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
 - CCKM allows the following characters in tag values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; : ' " _ **`
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Save**.

A message **Secret successfully rotated** is displayed on the screen. Navigate to **Cloud Keys > Azure > View/Edit > Versions** to view the versions of the rotated Azure secret.

Soft-Deleting Azure Secrets

Soft deleting is the process of deleting Azure secrets from the Azure vaults and CCKM. These secrets still exist on CCKM and in the Azure vaults. The soft-deleted secrets can be recovered.

Note

This operation can be performed only on the Azure secrets residing in the soft-enabled key vaults.

To soft-delete an Azure secret:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.

3. Click the **Secrets** tab. The list of available Azure secrets is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Soft Delete**. The Confirm Soft Delete dialog box is displayed.
5. Click **Soft Delete**.

A message **Secret <secret name> soft-deleted** is displayed on the screen. The status of the secret changes to **SOFT-DELETED**.

Recovering Soft-Deleted Azure Secrets

If needed, you can recover a soft-deleted secret.

To recover a soft-deleted Azure secret:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Secrets** tab. The list of available Azure secrets is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Recover**. The Confirm Recover Secret dialog box is displayed.
5. Click **Recover**.

A message **Secret <secret name> recovered from soft-delete.** is displayed on the screen. The status of the secret changes to **AVAILABLE**.

Purging Azure Secrets

Purging is the process of permanently deleting soft-deleted Azure secrets from the Azure vaults. However, backup of the purged secret can be restored on CCKM. If you wish to restore backup of the purged secret, follow the steps mentioned in the [Restoring Backup](#) section.

Note

This operation can be performed only on the soft-deleted Azure secrets residing in the soft-enabled key vaults.

To purge an Azure secret:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Secrets** tab. The list of available Azure secrets is displayed.

4. Click the overflow icon () corresponding to the desired alias and click **Purge**. The Purge Azure secret dialog box is displayed.
5. Select the **I wish to purge this secret.** check box.
6. Click **Purge Secret**.

Purging a secret might take some time. After successful deletion, a message **Secret <secret name> hard deleted** is displayed on the screen. The status of the secret changes to **DELETED**.

If needed, you can restore a purged secret from its backup. Refer to [Restoring Backup](#) for details.

Restoring Backup

To restore a purged Azure secret:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Secrets** tab. The list of available Azure secrets is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Restore**. The Confirm Restore secret dialog box is displayed.
5. Select the desired secret vault from the **Select Vault** drop-down list.

Note

Restoration of secrets among cross-region vaults is not allowed.

6. Click **Restore Secret**.

A message **Secret <secret name> restored** is displayed on the screen. The secret is restored to the selected key vault. The secret status changes to **AVAILABLE**.

Deleting Backup

Deleting a backup permanently removes the backup of a deleted Azure secret from CCKM.

Note

This operation can be performed only on the secrets with **DELETED** status.

To delete the backup of an Azure secret from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**.
3. Click the **Secrets** tab. The list of available Azure secrets is displayed.
4. Click the overflow icon () corresponding to the desired alias and click **Delete Backup**. The Hard Delete Azure Secret dialog box is displayed.
5. Select the **I wish to delete the backup of this secret.** check box.
6. Click **Delete Secret Backup**.

A message **Secret <secret name> backup deleted** is displayed on the screen. The backup of the secret is permanently deleted from CCKM.

Scheduling Operations

CCKM allows you to periodically refresh keys, rotate keys, or add KMS containers in the background. To refresh keys, rotate keys, or add KMS containers, you need to create schedule configuration. A schedule configuration defines when to run a refresh, rotation, or KMS container job. You can use either the basic or cron format to specify when the rotation, refresh, or KMS container job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- Repeats: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- at: specific time at which the rotation or refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

"* * * * *"

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. Select **Schedule Type** as **Key Rotation**.
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Azure** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. Set the values on the **Schedule Config** screen.

You can schedule configuration for:

- **All Keys**: Refer to [Configuring Rotation Schedule for All Keys](#) for details.
- **Only Expiring Keys**: Refer to [Configuring Rotation Schedule for Expiring Keys](#) for details.
- **All Keys Based on Creation/Last Rotation Date**: Refer to [Configuring Rotation Schedule for All Keys Based on Creation or Last Rotation Date](#) for details.

Configuring Rotation Schedule for All Keys

To configure rotation schedule for all keys:

1. Configure **DURATION** for the scheduler. Specify the following values:
 - a. **Schedule Starts**
 - b. **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

2. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either the **Basic** or the **Raw (Cron)** format to specify the value.
3. (Optional) Set the expiry of the new key that will be created through rotation. If not specified, the new key material never expires. For example, if you set the expiry time to **6 Hours**, the key material of the new key will expire in 6 hours.
4. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Configuring Rotation Schedule for Expiring Keys

To configure rotation schedule for expiring keys:

1. In the **SELECTION** section, select the keys to be rotated based on their expiry time. In the **Only rotate keys within _ of material expiration** field, select or enter the key expiry time. For example, if the value of **Only rotate keys within _ of material expiration** field is set to **4 Days**, then the rotation schedule is created for all the keys that will expire in 4 days.
2. Configure **DURATION** for scheduler. Specify the following values:

a. **Schedule Starts**

b. **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the **Schedule Ends** field becomes unavailable.

3. (Optional) Set the expiry of the new key that will be created through rotation. If not specified, the new key material never expires. For example, if you set the expiry time to **6 Hours**, the key material of the new key will expire in 6 hours.
4. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Configuring Rotation Schedule for All Keys Based on Creation or Last Rotation Date

To configure rotation schedule for all keys based on their creation or last rotation date:

1. In the **SELECTION** section, select the keys to be rotated based on their creation or last rotation date.

In the **Only rotate keys after _ of creation/last rotation date** field, select or enter the number of days, weeks, months, or years. For example, if the value of **Only rotate keys after _ of creation/last rotation date** field is set to **4 Days**, then all the keys will rotate after 4 days of their creation or last rotation date. The default duration is 7 Days.

2. Configure **DURATION** for scheduler. Specify the following values:

- a. **Schedule Starts**
- b. **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

3. (Optional) Set the expiry of the new key that will be created through rotation. If not specified, the new key material never expires. For example, if you set the expiry time to **6 Hours**, the key material of the new key will expire in 6 hours.
4. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Adding Key Refresh Schedule

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. Select **Schedule Type** as **Key Refresh**.
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Azure** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the following values:
 - **Schedule Starts**
 - **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
- c. Click **Next**.

8. On the **Add Vaults** screen:

- a. Select the vault name from the **Refresh Keys, Certificates and Secrets from Selected Vault(s)** drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types can be Standard, Premium, and ManagedHSM.
- b. Click **+** button.

Similarly, you can add more vaults.

- c. Select the **Refresh All Vaults** option if you want to refresh all the existing vaults.
- d. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Automatic Cloud Key Discovery

A KMS container schedule automatically detects the KMS containers based on the Azure Cloud connection and adds them to the CipherTrust Cloud Key Manager.

Adding a KMS container (vault or subscription) to CCKM consumes one CCKM license count.

To add a KMS container schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Select Schedule Type screen of the Add New Schedule wizard is displayed.

Schedule Type

1. Select Schedule Type as **Add KMS Container**.
2. Click **Next**. The General Info screen is displayed.

General Info

1. Enter a unique **Schedule Name**.
 2. Select **Azure** from the **Cloud Name** drop-down list.
 3. (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
-

4. (Optional) Select **Enable Schedule** to enable the schedule.
5. Select a **Define Job Type**. You can select either **Discover Only** or **Discover and Add**.

Note

Discover Only lists all the discovered containers. Discover and Add adds all the discovered containers to the CCKM.

6. Click **Next**. The Connection & ACL Info screen is displayed.

Connection & ACL Info

1. Select a **Connection**.
2. In the ACCESS CONTROL section.
 - a. Click **Keys**, **Certificates**, **Secrets**, or **Reports** tab.
 - b. Click **Assign User/Group**. The Assign User/Group dialog box is displayed.
 - c. Select the desired user or group from the **User/Group** drop-down list.
 - d. Click **Save**. The newly added user/group is displayed under **Name** in the ACCESS CONTROL section.
 - e. Grant the permissions to the user/group, as appropriate.

Granting additional permissions

To grant the additional permissions, select the check box under the desired operation corresponding to the desired users or groups. The following permissions can be granted.

- **Keys:** View, Add Key, Edit Key, Recover Key, Purge Key, Upload Key, Restore Key, Soft Delete Key, Delete Key Backup, Refresh Key
- **Certificates:** View, Add, Upload, Edit, Soft Delete, Recover, Purge, Restore, Delete Backup, Refresh
- **Secrets:** View, Add, Edit, Soft Delete, Recover, Purge, Restore, Delete Backup, Refresh
- **Reports:** View Report, Add Report, Download Report, Delete Report

To remove a permission, clear the check box under the desired operation.

- f. Remove a user or group.
 - a. Under **Unassign**, click **X** corresponding to the desired user/group. The Remove Group dialog box is displayed.

b. Click **Remove**.

3. Click **Next**. The Schedule Config screen is displayed.

Schedule Config

1. Configure **DURATION** for the scheduler. Specify the schedule start and end time:

- **Schedule Starts**: Specify time when the schedule starts.
- **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
- **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

2. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.

3. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

After the schedule is run successfully, Azure Key Vaults and Azure Subscriptions will be added to the CCKM. You can see them in the Vaults and Subscriptions sections, of the Azure Key Vaults page in the CCKM.

Adding Key Backup (Azure only) Schedule

A key backup schedule downloads and saves encrypted cloud key backup blobs at specified time intervals. These backups can be used to restore keys.

Warning

- The Physical and Virtual storage appliances have storage limits. Ensure that you have sufficient storage before enabling scheduled backup.
- If you do have sufficient storage, you can extend the storage, refer to [Resizing the Virtual Hard Disk After Deployment](#) for details.

To add a Key Backup (Azure only) schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Select Schedule Type screen of the Add New Schedule wizard is displayed.

Schedule Type

1. Select Schedule Type as **Key Backup (Azure only)**.
2. Click **Next**. The General Info screen is displayed.

General Info

1. Enter a unique **Schedule Name**.
2. (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
3. (Optional) Select **Enable Schedule** to enable the schedule.
4. Click **Next**. The Schedule Config screen is displayed.

Schedule Config

Note

Backup Limit: If the sum of Scheduled and Manual Backups exceeds the maximum allowance of 30 instances, older backups will be deleted automatically.

1. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.
2. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
3. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only) • Cloud Key Backup
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Creation time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

- Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.
- Edit or configure the following fields:
 - Description.
 - Status of the scheduler configuration.
 - (For KMS Container schedule) Define Job Type.
 - **CONNECTION & ACL INFO** details, refer to the add KMS container [Connection & ACL Info](#) section.
 - Scheduler configuration parameters such as duration, frequency, and expiry time of the key. Refer to the key rotation [Schedule Config](#) screen, key refresh [Schedule Config](#) screen, or KMS container [Schedule Config](#) screen for details, as appropriate.
- Click **Update** to save the changes.

JOB HISTORY

The Schedules page also contains a section named JOB HISTORY. Every time a schedule is run, a Job is created.

- This section displays information related to a job such as **Run Date**, **Job ID**, **Status**, and **Errors**.
- To view the details of the job, click the **Job ID** link corresponding to the desired job. The Job details page is displayed. It shows the list of Subscriptions and Vaults along with their details.

- To download the reports of Subscriptions and Vaults, go to the top left of the Job details page, click **Download**, and select a **report** from the drop-down menu. The options are **Subscriptions Only**, **Vaults Only**, and **Subscriptions and Vaults**.

Note

You can download the report after the schedule has run successfully.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Managing Azure Reports

CCKM provides options to generate key visibility reports based on:

- Key-related activities between CCKM and Azure Vault
- Track keys by their expiration dates
- What applications are using the keys

Azure reports are categorized as:

- **Key Activity Report:** Inspect individual Azure key histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and Azure Vault.
- **Key Aging Report:** Track keys by their expiration dates. Audit a range of dates, from past material deletions to future scheduled deletions, within the selected Azure Vault.
- **Service/Usage Report:** Monitor key usage by tracking services and applications consuming the keys. View when and where a service requests the use of each key.

Prerequisites

For managing Azure reports on CCKM, you need an Azure Log Analytics workspace ID. This ID needs to be configured in the Diagnostic settings of the key vault for which reports need to be generated. To determine the workspace ID:

1. Configure Log analytics workspace. Refer to [Create a Log Analytics workspace in the Azure portal](#) for details.

Note

The Log Analytics Reader role is required to access Log Analytics workspace to generate the Azure reports on CCKM. Usually, the role comes via inheritance when the Reader role is assigned to an App on subscription. If the App does not have the read permission at the subscription level, the read permission should be explicitly provided at the individual resource level (Log Analytics workspace).

2. Determine the Workspace ID of the desired Log Analytics workspace. Click the workspace name to view its details including the **Workspace ID**.
3. Navigate to the Key vaults page. This page shows the list of existing Azure key vaults.
4. Perform the following steps:
 - a. Under **Name**, click the desired key vault. The <key-vault> page is displayed.
 - b. Click **Diagnostic settings > Add diagnostic setting**.
 - c. Specify a **Diagnostic setting name**.
 - d. Under **Category details**, select **AuditEvent** and **AllMetrics**.
 - e. Under **Destination details**:
 - a. Select **Send to Log Analytics workspace**.
 - b. Select the desired **Subscription** from the drop-down list.
 - c. Select the desired **Log Analytics workspace** from the drop-down list.
5. Save the changes.

The changes may take some time to take effect. After the changes are effective, you can manage Azure reports on CCKM, as described below.

Creating Azure Reports

CCKM users with the **Add Report** permission can create reports.

To create an Azure report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Azure**. The Azure Reports page is displayed.
3. Click **Add Report**. The Choose Report Type and Name screen of the Add Azure Report wizard is displayed.
4. Select a report type. The options are:

-
- Key Activity Report
 - Key Aging Report
 - Service/Usage Report
5. Specify a **Report Name**. This is a mandatory field.
 6. Click **Next**. The Select Analytics Parameters screen of the wizard is displayed.
 7. Select an **Azure Vault** from the drop-down list. The list shows the available Azure key vaults with their types specified in parenthesis. The Azure key vault types are Standard, Premium, and ManagedHSM.
 8. *(Not applicable to Key Aging Report)* Specify a **Workspace ID**. Refer to [Prerequisites](#) for instructions to determine the Workspace ID.
 9. Click **Add**. The selected Azure Vault is displayed under Selected Log Analytics Parameters. Add more vaults, if required.
 10. Click **Next**. The Set Start and End Dates screen of the wizard is displayed.
 11. In the **Include Entries From** field, specify the start date and time for the report.
 - Click the field and select the date and time on the on-screen calendar.
 - Alternatively, enter the time in **MM/DD/YYYYHH:MM** format.
 12. In the **To** field, specify the end date and time for the report.
 13. Click **Save**.

A success message **Created report** is displayed. The newly created report is displayed under the Azure reports list. The report status becomes Running Now.

Viewing Azure Reports

CCKM users with the **View Report** permission can view reports.

The Azure Reports page displays the list of existing reports. Filter the reports by their names.

To view existing Azure reports:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Azure**. The list of available reports is displayed. The following details of the reports are displayed:

Column Name	Description
Report Name	Name of the report.

Column Name	Description
Run Date	When the report is run.
Type	Type of the report. The type can be: • Key Activity Report • Key Aging Report • Service/Usage Report
Start Date	Start date from when the report is generated. If a report is run now, its status becomes Running Now.
End Date	End date for the report.

Viewing Details of an Azure Report

CCKM users with the **View Report** permission can view reports.

To view the details of an Azure report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Azure**. The list of available reports is displayed.
3. Click the desired **Report Name** link. The details of report are displayed.

Alternatively, click the overflow icon () corresponding to the desired alias and click **View**.

Downloading Azure Reports

CCKM users with the **Download Report** permission can download reports.

To download an Azure report as a CSV file:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Azure**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Download**.

Alternatively, click the desired report under **Report Name**, and click **Download CSV** in the detail view.

The report is downloaded as a CSV file.

Deleting Azure Reports

CCKM users with the **Delete Report** permission can delete reports.

To delete an Azure report:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Reports > Azure**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired alias and click **Delete**. The Confirm Delete Report message is displayed.
4. Click **Delete Report**.

The report is removed from the list of reports.

Viewing Azure Subscriptions

In Azure, a subscription is added automatically when a vault is added to the CipherTrust Cloud Key Manager. When the last vault associated with a subscription is removed from CCKM, the subscription is automatically removed from CCKM.

To view the list of Azure subscriptions added to the CipherTrust Manager:

1. Log on to the **CipherTrust Manager** GUI as administrator.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab shows the list of Azure vaults added to the CipherTrust Manager.
4. Click the **Subscriptions** tab. The tab displays the following details:

Column	Description
Subscription ID	ID of the Azure subscription.
Subscription Name	Name of the Azure subscription.
Created At	Date and time when the subscription is added to the CipherTrust Manager.
State	State of the subscription, enabled or disabled.

Performance Summary

This section provides metrics and results of Azure performance testing.

Test Setup

Test Runner	
Operating System	Ubuntu 20.4
RAM	32GB
Core	16

Appliance	
Build	2.8.0.7157
RAM	16GB

Process

Scripts are written on top of the Locust Framework for load and stress testing. The testing is done for create, read, update, and delete (CRUD) key operations with respect to different numbers of virtual users (VUS) over parallel connections, one for every virtual user.

The testing also done to determine the response for uploading keys by a number (N) of virtual users in time (T).

CRUD Operations

Expand the headings below to view performance numbers.

Time taken per key upload with respect to virtual users

Virutal Users	Minimum	Average	Maximum
10	2.971	6.911	11.698
30	5.672	18.155	27.679
50	6.714	22.403	38.941

In the graph above:

- X-axis represents the increment of virtual users.
- Y-axis represents the time taken by a virtual user to perform BYOK operations.
- 3 line graphs display information for minimum (min), average (avg), and maximum (max) time taken by one of the virtual users running at that time.

Response with request coverage in percentile (10 VUS, 180 seconds)

X% percentile	create_byok	get	update	soft-delete	hard-delete	delete-backup
50	6	0.36	8	9.7	5.7	4.2
60	6.2	0.41	8.7	10	7.6	4.3
70	6.5	0.55	9.3	10	8.9	4.4
80	6.6	0.63	10	11	10	4.5
90	7.1	0.82	11	12	11	5.7
100	7.7	1.3		12	12	6.7

Here, X% percentile indicates that X percent requests are completed before this time.

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform any CRUD operation.
- An individual virtual user has performed these CRUD operations sequentially, whereas all the virtual users are spawned in parallel.

Response with request coverage in percentile (30 VUS, 180 seconds)

X% percentile	create_byok	get	update	soft-delete	hard-delete	delete-backup
50	18	0.4	22	23	21	16
60	23	0.44	24	25	23	17
70	26	0.48	26	26	23	18
80	27	0.56	26	27	23	20
90	27	0.8	27	27	23	21
100	28	1.3	29	28	23	23

Here, X% percentile indicates that X percent requests are completed before this time.

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform any CRUD operation.
- An individual virtual user has performed these CRUD operations sequentially, whereas all the virtual users are spawned in parallel.
- t represents time taken for a key operation when N virtual users are running in parallel.

Response with request coverage in percentile (50 VUS, 180 seconds)

X% percentile	create_byok	get	update	soft-delete	hard-delete	delete-backup
50	24	0.43	39	38	34	33
60	29	0.55	40	38	35	34
70	31	0.69	40	38	35	35
80	34	0.78	41	38	35	35
90	37	0.99	41	39	35	35
100	39	1.4	43	41	36	35

Here, X% percentile indicates that X percent requests are completed before this time.

- In the graph above:
- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
 - Y-axis represents the time taken by a virtual user to perform any CRUD operation.
 - An individual virtual user has performed these CRUD operations sequentially, whereas all the virtual users are spawned in parallel.
 - t represents time taken for a key operation when N virtual users are running in parallel.

Key Upload

This section provides performance numbers for uploading keys by a number (N) of virtual users in time (T).

Expand the headings below to view performance numbers.

Number of keys uploaded by virtual users in 100 seconds

Virtual Users	Number of Keys
10	135

Virtual Users	Number of Keys
30	130
50	116

The graph above shows the number of keys uploaded in t time when N virtual users are spawned in parallel. Also, it indicates throttling condition breakpoints and helps you calculate throughput per second (TPS).

Response for upload with percentile request coverage

X% percentile	10 VUS	30 VUS	50 VUS
50	5.9	21	37
60	6.3	23	38
70	7.5	25	38
80	9.2	25	38
90	11	28	39
100	12	28	42

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform the BYOK (upload key) operation.
- While calculating TPS, Locust informs about the time taken to complete X% requests when all the virtual users are spawned in parallel.
- The number of virtual users does not significantly affect the number of keys being uploaded. This proves the rate limit implemented by Azure side causes throttling.

Allowing AD Users to Manage Azure Vaults

This section describes how to allow AD users to manage Azure vaults using CCKM. Change the sample values according to your requirements.

Note

This feature works in the root domain only.

1. Create an LDAP connection (for example, `ldapcon`) on the CipherTrust Manager.

```
curl -k '<IP>/v1/usermgmt/connections' -H 'Authorization: Bearer AUTHTOKEN' -H 'Content-Type: application/json' -H 'accept: application/json' --data-binary $'{\n "name": "ldapcon",\n "strategy": "ldap",\n "options": {\n "server_url": "ldap://<ldap-server-ip>\",\n "root_dn": "dc=calculate",\n "uid_field": "ui
```

```
d",\n "user_dn_field": "dn",\n "bind_dn": "cn=ldapadmin,dc=calculate",\n "bind_password": "<password>",\n "group_base_dn": "dc=calculate",\n "group_member_field": "memberUid",\n "group_id_field": "cn",\n "group_filter": "objectClasses=posixGroup",\n "guid_field": "uid"\n }\n }
```

Here, `server_url` is the URL of the LDAP server.

2. Create a local group (for example, `localgroup`) on the CipherTrust Manager.

```
curl -k '<IP>/v1/usermgmt/groups' -H 'Authorization: Bearer AUTHTOKEN' -H 'Content-Type: application/json' -H 'accept: application/json' --data-binary '${\n "name": "localgroup"\n }' --compressed
```

3. Map the LDAP group on LDAP server (for example, `ldapgroup`) to the newly created `localgroup`.

```
curl -k '<IP>/v1/usermgmt/groupmaps' -H 'Authorization: Bearer AUTHTOKEN' -H 'Content-Type: application/json' -H 'accept: application/json' --data-binary '${\n "connection_name": "ldapcon",\n "connection_group_name": "ldapgroup",\n "group_name": "localgroup"\n }' --compressed
```

4. Map the LDAP group on LDAP server (for example, `ldapgroup`) to the "CCKM Users" group.

```
curl -k '<IP>/v1/usermgmt/groupmaps' -H 'Authorization: Bearer AUTHTOKEN' -H 'Content-Type: application/json' -H 'accept: application/json' --data-binary '${\n "connection_name": "ldapcon",\n "connection_group_name": "ldapgroup",\n "group_name": "CCKM Users"\n }' --compressed
```

5. Add an Azure connection. Refer to [Microsoft Azure](#) for details on required fields.
6. Add an Azure vault. Refer to [Adding Existing Vaults](#) for details.
7. Assign the `localgroup` to this vault.
8. Log on to the Ciphertrust Manager using `ldapgroup` over the LDAP connection, `ldapcon`.

```
username: ldapcon/<ldap-user-name>
password: <ldap-user-login-password>
```

The newly added Azure vault should be visible.

Configuring Connection to Azure Using Private Link

This section describes how to configure connection to azure using [private link](#).

Prerequisites

1. Integrate the Azure key vault with the Azure private link
2. Add a Microsoft Azure connection to the CipherTrust Manager

Adding the Integrated Azure Key Vault to CCKM

You need to add the integrated Azure key vault to CCKM. Refer to [Adding the existing Azure vaults](#) for details.

When adding the Azure key vault, if you do not see the name of the vault, there is missing direct connectivity or DNS resolution failure. You can resolve the DNS resolution failure by adding a DNS host.

To add a DNS host.

1. Log on to the **CipherTrust Manager** GUI.
2. In the left pane, click **Admin Settings > DNS Hosts**.
3. Click **Add DNS Host**.
4. Enter **Hostname**.
5. (Optional) Select either **Address** or **Host-Record**.
6. Enter **DNS IP Address**, it can be either a private IP or a public IP.
7. Click **Add DNS Host**.

Downloading Azure Metadata

Downloading Azure Keys Metadata

CCKM users with permissions to view the Azure keys can export and download the keys metadata displayed on the CCKM GUI. Filter the keys metadata to display on the GUI based on your requirements, for example, all keys created in the past 12 months, all keys residing in a specific vault, and all keys based on a specific algorithm. You can then download the filtered metadata as a CSV file.

To download the Azure keys metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Azure**. The Keys tab of the Azure page is displayed.
3. Filter the keys metadata based on your requirements.

Use the Search box to filter the keys. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The metadata of Azure keys and their key versions visible on the Keys tab is downloaded as a CSV file.

Downloading Azure Key Vaults Metadata

CCKM users with permissions to view the Azure key vaults can export and download the vaults metadata displayed on the CCKM GUI. Filter the vaults metadata to display on the GUI based on your requirements. You can then download the filtered metadata as a CSV file.

Metadata of a maximum of 100 Azure key vaults can be exported and downloaded.

To download the Azure key vaults metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Azure Key Vaults**. The Vaults tab of the Azure Key Vaults page is displayed.
3. Filter the key vaults metadata based on your requirements.

Use the Search box to filter the key vaults. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The metadata of Azure key vaults visible on the Vaults tab is downloaded as a CSV file.

Microsoft Double Key Encryption (DKE) Resources

CCKM provides support for Double Key Encryption (DKE) for Microsoft 365. With DKE, two keys are used to access content (such as files or documents) that is protected with the sensitivity labels that you apply when using any one of the supported Microsoft Office apps. You hold one key in CCKM, which you maintain full control over using Microsoft's Double Key Encryption service. The other is securely stored within Microsoft Azure. To decrypt and gain access to the protected content, both keys are required. Since Microsoft holds only one of the keys, this solution ensures that Microsoft cannot independently access this content. Only your authorized users can access the protected content.

Only your highly confidential data should be protected by DKE, which is typically a small percentage of your organization's overall data. For more information about DKE, guidance on what type of content to protect, the supported office applications, and other information, refer to [Double Key Encryption](#).

DKE encryption workflow

1. User adds a DKE label to a document. The Microsoft Office client connects to Azure RMS (Protection Service).

Note

For detailed information on DKE labeling requirements, see [DKE labeling requirements for Office apps](#).

To learn about the minimum supported versions for sensitivity labels, see [Minimum versions for sensitivity labels in Office apps](#).

2. User certificate, API templates, and Azure RMS key are sent to the Microsoft Office client.
3. Microsoft Office client requests CCKM for the DKE public key associated with the applied label.
4. CCKM verifies the request. After authorization succeeds, CCKM sends the DKE public key to the Microsoft Office client.
5. Microsoft Office client encrypts the document content with the content key.
6. Microsoft Office client encrypts the part of the metadata that controls access to the content with the DKE public key.
7. Microsoft Office client encrypts the encrypted metadata with the Azure RMS key.

The content is protected with the double-encrypted content key, RMS key and DKE public key. The following illustration shows the DKE encryption workflow:

DKE decryption workflow

1. User opens a document which has a DKE label. The Microsoft Office client first sends the double-encrypted metadata to Azure RMS (Protection Service).

2. Azure RMS (Protection Service) decrypts the double-encrypted metadata using the Azure RMS key and returns the simple-encrypted metadata.
3. Microsoft Office client sends the simple-encrypted metadata to CCKM and requests CCKM to decrypt it.
4. CCKM verifies the request and goes through the authorization process. When authorization passes successfully, CCKM decrypts the simple-encrypted metadata and returns the decrypted metadata to the Microsoft Office client.
5. Microsoft Office client uses the content key to decrypt the document. The user can view the document content.

The following illustration shows the DKE decryption workflow:

The following are the high-level steps to configure DKE within Microsoft and CipherTrust Manager/CCKM:

1. [Complete the prerequisites.](#)
2. [Configure DKE on CCKM.](#)
3. [Register your DKE service from Microsoft Azure portal.](#)

Prerequisites

In preparation for deploying DKE, ensure that the following prerequisites are met:

1. Ensure CipherTrust Manager/CCKM is installed and running. In addition, ensure to activate and install the CCKM license. Refer to the [CipherTrust Manager Deployment Guide](#) and [Licensing](#) for details.
2. The NTP server is added. Refer to [Add an NTP Server](#) for details.
3. Install a third-party CA certificate on the web interface.

Note

We recommend obtaining a CA-signed certificate for the web interface from trusted CAs that are part of the Microsoft Trusted Root Program. For more information, refer to [Microsoft Trusted Root Program participants](#).

4. Ensure the following.
 - If you have a load balancer that terminates the TLS connection and has mTLS disabled, the load balancer has a valid TLS certificate signed by a trusted CA.
 - If you have a load balancer that doesn't terminate the TLS connection or you don't have a load balancer in front of CipherTrust Manager, CipherTrust Manager has a valid TLS certificate signed by a trusted CA.

- Additional DNS record is configured with **dke.** prefix and pointing to the same IP Address of the CipherTrust Manager or SSL Passthrough Load Balancer.
 - Subject Alternative Name (SAN) in the TLS certificate includes **dke.** prefixed DNS name, along with other DNS names associated with CipherTrust Manager or SSL Passthrough Load Balancer.
5. **Microsoft 365 E5 License:** Windows clients must have a Microsoft 365 E5 license. Refer to information about [system and licensing requirements for DKE](#) for more information these licensing requirements.

Note

CCKM supports built-in sensitivity labeling with Office apps. CCKM does not support Azure Information Protection unified labeling client, which is to be deprecated in the future.

6. **User Presence in Azure Directory:** Users who have to create and share documents or files protected by DKE must be part of the Azure Active Directory (Azure AD) associated with the organization's tenant.

Note

- DKE is tested on the Windows and iOS devices. It is not tested on macOS and Android devices.
- To configure the B2B cross-tenant access settings, refer to [Configure cross-tenant access settings for B2B collaboration](#).

You can now Configure DKE on CCKM.

Configure DKE on CCKM

To configure DKE on CCKM, do the following:

1. From the CCKM GUI or API, create a DKE endpoint. Refer to [Creating Microsoft DKE Endpoints](#) for details on how to create a DKE endpoint from the CCKM GUI or [Creating Microsoft DKE Endpoints using the CCKM API](#).

Note

- Only Azure AD users are currently supported. The email addresses included in the API call must be associated with a user Azure AD. The email address parameter an optional field applicable only if `authorization_type` is set to email.

If you specify one or more email addresses in a DKE endpoint, this field is validated against the User Principal Name (UPN) claim in the JWT received during the decrypt operation. The UPN is the unique sign-in identifier for each user in Microsoft Entra ID. For guest access, where the UPN claim might not be present in the token, the 'email' claim in the token is used instead.

- A Microsoft Office 365 client user and email (if configured in CipherTrust Manager) must match.
- The *Issuer* field must be specific to the tenant configured in the Microsoft Azure Portal.
- The web interface port within CipherTrust Manager can be changed from the default port of 443 to another port. If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it BEFORE configuring the Microsoft DKE service on CCKM. Also reflect this port change when creating a DKE endpoint on CCKM as part of the prerequisites for deploying DKE. **Changing the default port AFTER configuring Microsoft DKE is not supported.**

Register DKE Service

After creating a DKE endpoint, register your DKE service from the Microsoft Azure portal.

Note

- When registering your DKE service, ensure that **Application ID URI** matches the FQDN of the CipherTrust Manager. In the case where you are using a load balancer in front of the CipherTrust Manager, ensure that Application ID URI matches the FQDN of the load balancer. You can only register one DKE service per one instance of CipherTrust Manager.
- Also, ensure that the publisher domain on the *Branding and Properties* page is set to the domain in which CipherTrust Manager is deployed. For example, if CipherTrust Manager is `test.thalescpl.io`, then ensure that the publisher domain includes `thalescpl.io`.

Single Tenant Application

When to Use the Single Tenant Application

Single tenant applications are only available in the tenant they were registered in, also known as their home tenant. DKE-labeled data will only be used within home tenant, configured with one CCKM environment.

For more details, refer to [Tenancy in Microsoft Entra ID](#).

Register a Single Tenant Application

To register a single tenant application.

1. Sign in to the [Microsoft Azure portal](#).
2. Under Azure services, click **App registrations**.
3. Click **New registration**.
4. Enter **Name**, like SingleTenantApplication.
5. Select **Accounts in any organizational directory (Any Microsoft Entra ID tenant - Single Tenant)** as the account type.
6. Under **Redirect URI**:
 - a. Select **Web** as the platform.
 - b. Enter the **URI** of CipherTrust Manager, like `https://dke.thalescpl.io`.
7. Click **Register**.

Copy the **Application (client) ID** and **Directory (tenant) ID**.

Now configure the single tenant application that includes the following.

1. [Authenticate Tokens and ID Tokens](#)
2. [Adding a Certificate or Secret](#).

Note

- It is optional to add a certificate or secret.
- You will get the credentials after adding a certificate or secret. You will need the credentials during the role-based authentication.

3. [Adding an API permission](#).
4. [Exposing an API](#).
5. [Adding the Owner](#).

Note

It is optional to add the owner.

Authenticate Tokens and ID Tokens

To authenticate the tokens and ID tokens.

1. Go to the left pane, click **Manage > Authentication**.
2. Enable **Access tokens**
3. Enable **ID Tokens**.
4. Click **Save**.

Adding a Certificate or Secret

To add a certificate or secret.

1. Go to the left pane, click **Manage > Certificates & secrets**.
2. Click **New client secret**. The Add a client secret wizard is displayed.
3. Enter **Description**.
4. (Optional) Select the desired **Expires** (Expiry days) from the drop-down list.
5. Click **Add**.

Copy the **Value** and **Secret ID** of the secret. You will need the Value and Secret ID to [add an Azure connection on CCKM](#).

Adding an API Permission

For role-based authorization, the **User.Read.All** and **RoleManagement.Read.Directory** permissions are required to retrieve user details and their assigned roles.

To add an API permission.

1. Go to the left pane, click **Manage > API permissions**.
2. Click **Add a permission**. The Request API permissions wizard is displayed.
3. Click **Microsoft Graph**.
4. Click **Application permissions**.
5. Add the **User.Read.All** and **RoleManagement.Read.Directory** permissions.

To add the **User.Read.All** permission.

- a. In the Select permissions search box, search for **User**.
- b. Expand **User** from the result.

-
- c. Select **User.Read.All** from the User list.

To add the **RoleManagement.Read.Directory** permission.

- a. In the Select permissions search box, search for **RoleManagement**.
 - b. Expand **RoleManagement** from the result.
 - c. Select **RoleManagement.Read.Directory** from the RoleManagement list.
6. Click **Add permissions**.
 7. Click **Grant admin consent for {tenant}**. The Grant admin consent confirmation dialog box is displayed.
 8. Click **Yes**.

Note

If you do not have the admin rights, please ask your admin to grant the admin consent. You need to share the consent grant URI to your admin, like https://login.microsoftonline.com/{organization}/adminconsent?client_id={client-id}. In the URI, the {organization} is Directory (tenant) ID and {client-id} is Application (client) ID that you copied during the registration.

Exposing an API

Exposing an API includes adding the Application ID URI, adding a scope, and authorizing the client applications.

Adding the application ID URI.

1. Go to the left pane, click **Manage > Expose an API**.
2. Click **Add**. The Edit application ID URI is displayed.
3. Enter **Application ID URI**, the URI of the CipherTrust Manager.
4. Click **Save**.

Adding a scope.

1. Click **Add a scope**. The Add a scope wizard is displayed.
 2. Enter **Scope name**, like "user_impersonation".
 3. Select the Consent as **Admins and users**.
 4. Enter **Admin consent display name**.
 5. Enter **Admin consent description**.
-

-
6. (Optional) Enter **User consent display name**.
 7. (Optional) Enter **User consent description**.
 8. (Optional) Enable **State**.
 9. Click **Add scope**.

Authorizing the client applications.

You need to authorize the Microsoft Office and Azure Information Protection applications. Perform the below steps for both the applications.

1. Click **Add a client application**. The Add a client application wizard is displayed.
2. Enter **Client ID**.

Note

The Client ID of Microsoft Office and Azure Information Protection applications are d3590ed6-52b3-4102-aeff-aad2292ab01c and c00e9d32-3c8d-4a7d-832b-029040e7db99, respectively.

3. Enable **Authorized scopes**.
4. Click **Add application**.

Adding the Owner

To add the owner.

1. Go to the left pane, click **Manage > Owners**.
2. Click **Add owners**.
3. Search and select the desired owner.
4. Click **Select**.

Multitenant Application

When to Use the Multitenant Application

Multitenant applications are available to the users in both their home tenant and other tenants. Multitenant application can be used for the following.

- Cross-tenant access for B2B collaboration.

- Sharing one DKE endpoint across multiple Azure tenants.
- Using one CCKM environment for supporting DKE in multiple Azure tenants. For example Managed Service Providers need to create a multitenant application when their customers share one CCKM environment.

For more details, refer to [Tenancy in Microsoft Entra ID](#).

Register a Multitenant Application

Note

To trust the multitenant application, the admin of other tenant needs to add this application to their enterprise applications. The the admin of other tenant should enter and accept the consent grant URI, like `https://login.microsoftonline.com/{organization}/adminconsent?client_id={client-id}`.

Here, the {organization} is the **Directory (tenant) ID** of the other tenant and {client-id} is the **Application (client) ID** of the home tenant.

To create a multitenant application.

1. Sign in to the [Microsoft Azure portal](#).
2. Go to the left pane, click **Authentication**.
3. Click **App registrations**.
4. Click **New registration**.
5. Enter **Name**, like MultiTenantApplication.
6. Select **Accounts in any organizational directory (Any Microsoft Entra ID tenant - Multitenant)** as the account type.
7. Under **Redirect URI**:
 - a. Select **Web** as the platform
 - b. Enter the **URI** of CipherTrust Manager, like `https://dke.thalescpl.io`.
8. Click **Register**.

Copy the **Application (client) ID** and **Directory (tenant) ID**.

Now configure the multitenant application that includes the following.

1. [Authenticate Tokens and ID Tokens](#)
2. [Adding a Certificate or Secret](#).

Note

- It is optional to add a certificate or secret.
- You will get the credentials after adding a certificate or secret. You will need the credentials during the role-based authentication.

3. Adding an API permission.

4. Exposing an API.

5. Adding the Owner.

Note

It is optional to add the owner.

Authenticate Tokens and ID Tokens

To authenticate the tokens and ID tokens.

1. Go to the left pane, click **Manage > Authentication**.
2. Enable **Access tokens**
3. Enable **ID Tokens**.
4. Click **Save**.

Adding a Certificate or Secret

To add a certificate or secret.

1. Go to the left pane, click **Manage > Certificates & secrets**.
2. Click **New client secret**. The Add a client secret wizard is displayed.
3. Enter **Description**.
4. (Optional) Select the desired **Expires** (Expiry days) from the drop-down list.
5. Click **Add**.

Copy the **Value** and **Secret ID** of the secret. You will need the Value and Secret ID to [add an Azure](#)

connection on CCKM.

Adding an API Permission

For role-based authorization, the `User.Read.All` and `RoleManagement.Read.Directory` permissions are required to retrieve user details and their assigned roles.

To add an API permission.

1. Go to the left pane, click **Manage > API permissions**.
2. Click **Add a permission**. The Request API permissions wizard is displayed.
3. Click **Microsoft Graph**.
4. Click **Application permissions**.
5. Add the `User.Read.All` and `RoleManagement.Read.Directory` permissions.

To add the `User.Read.All` permission.

- a. In the Select permissions search box, search for **User**.
- b. Expand **User** from the result.
- c. Select **User.Read.All** from the User list.

To add the `RoleManagement.Read.Directory` permission.

- a. In the Select permissions search box, search for **RoleManagement**.
- b. Expand **RoleManagement** from the result.
- c. Select **RoleManagement.Read.Directory** from the RoleManagement list.
6. Click **Add permissions**.
7. Click **Grant admin consent for {tenant}**. The Grant admin consent confirmation dialog box is displayed.
8. Click **Yes**.

Note

If you do not have the admin rights, please ask your admin to grant the admin consent. You need to share the consent grant URI to your admin, like `https://login.microsoftonline.com/{organization}/adminconsent?client_id={client-id}`. In the URI, the {organization} is **Directory (tenant) ID** and {client-id} is **Application (client) ID** that you copied during the registration.

Exposing an API

Exposing an API includes adding the Application ID URI, adding a scope, and authorizing the client applications.

Adding the application ID URI.

1. Go to the left pane, click **Manage > Expose an API**.
2. Click **Add**. The Edit application ID URI is displayed.
3. Enter **Application ID URI**, the URI of the CipherTrust Manager.
4. Click **Save**.

Adding a scope.

1. Click **Add a scope**. The Add a scope wizard is displayed.
2. Enter **Scope name**, like "user_impersonation".
3. Select the Consent as **Admins and users**.
4. Enter **Admin consent display name**.
5. Enter **Admin consent description**.
6. (Optional) Enter **User consent display name**.
7. (Optional) Enter **User consent description**.
8. (Optional) Enable **State**.
9. Click **Add scope**.

Authorizing the client applications.

You need to authorize the Microsoft Office and Azure Information Protection applications. Perform the below steps for both the applications.

1. Click **Add a client application**. The Add a client application wizard is displayed.
2. Enter **Client ID**.

Note

The Client ID of Microsoft Office and Azure Information Protection applications are d3590ed6-52b3-4102-aeff-aad2292ab01c and c00e9d32-3c8d-4a7d-832b-029040e7db99, respectively.

3. Enable **Authorized scopes**.
4. Click **Add application**.

Adding the Owner

To add the owner.

1. Go to the left pane, click **Manage > Owners**.
2. Click **Add owners**.
3. Search and select the desired owner.
4. Click **Select**.

Note

Microsoft DKE supports guest accounts for external users to open the encrypted documents. For more details, refer to [Guest accounts for external users to open encrypted documents](#).

Managing DKE Endpoints

This section describes how to manage DKE endpoints from CCKM.

Microsoft Double Key Encryption (DKE) service can access CipherTrust Cloud Key Manager (CCKM) after you meet some prerequisites. Refer to [Microsoft Double Key Encryption \(DKE\) Resources](#) for more information about Microsoft DKE and the prerequisites.

Part of the prerequisites is [creating a DKE endpoint](#). After you have created a DKE endpoint, you can:

- [View DKE endpoints](#)
- [View and edit details of a DKE endpoint](#)
- [Enable a DKE endpoint](#)
- [Disable a DKE endpoint](#)
- [Rotate a DKE endpoint](#)
- [Delete a DKE endpoint](#)
- [Archive a DKE endpoint](#)
- [Recover a DKE endpoint](#)

Note

Users of the CCKM Admins group can manage DKE endpoints, whereas the users of the CCKM Users group can only view the DKE endpoints.

Caution

Modify endpoints only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not modify the KEK using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the KEK unavailable to the Microsoft DKE service.

Creating DKE Endpoints

From CCKM GUI, create a DKE endpoint to make it available to the Microsoft DKE service. You can either create a new key encryption key (KEK) or select an existing KEK for the getkey and decrypt operations. If you do not specify a key, CCKM will automatically create a CipherTrust Manager key for you.

Note

- Ensure that you have already created an authorized tenant, refer to [Managing DKE Authorized Tenants](#) for details.
- If you plan to use the authorization method of Role ID for the access settings of DKE keys, you are required to set up an Azure connection before creating a DKE endpoint. For more information on how to add an Azure connection, refer to [Microsoft Azure Connection](#).
- In the Microsoft Azure application, go to the API Permissions section and configure the **Directory.Read.All** permission. Ensure that the **Type** for this permission is Application.

API / Permission name	Type	Description	Admin consent requ...	Status
no Microsoft Graph (0)				See...
Directory.Read.All	Application	Read directory data	Yes	Consent required

To create a DKE endpoint from the CCKM GUI:

1. Log on to the **CipherTrust Manager** GUI as a member of the CCKM Admins group.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is

displayed.

4. Click **Create Endpoint**. The **Add Double Key Encryption (DKE) Endpoint** dialog box is displayed.
5. Under **General Info**, enter a unique **Name** and a description for the endpoint.
6. Click **Next**.
7. Under **Endpoint Settings**, provide the following settings:
 - **Key URI Hostname**. Enter the hostname at which CipherTrust Manager will be visible to Microsoft.
 - The Key URI Hostname will be used to construct the URL Microsoft will use to send requests to CipherTrust Manager.
 - The web interface of the CipherTrust Manager must have a valid TLS certificate signed by a trusted CA.
 - If the SSL termination takes place at the CipherTrust Manager, the Key URI Hostname must match the FQDN of the CipherTrust Manager. If the SSL termination takes place at the load balancer in front of the CipherTrust Manager, the Key URI Hostname must match the FQDN of the public-facing load balancer. Wildcard certificates are supported.
 - If you changed the web interface port within the {cm} from the default port (443) to another port (say 8443), add the same port when configuring the Key URI Hostname. Specify the new port number with the Key URI Hostname, for example, `example.com:8443`.
 - If you have a load balancer with SSL termination and mTLS disabled, the Key URI Hostname must match the FQDN of the public-facing load balancer.
 - If you have a load balancer without SSL termination, the Key URI Hostname must match `dke.<load balancer hostname>`.
 - If you don't have a load balancer in front of CipherTrust Manager, the Key URI Hostname must match `dke.<CipherTrust Manager hostname>`.
 - **Key Algorithm**. The only option available for the DKE key algorithm is `RSA_DECRYPT_OAEP_2048_SHA256`. This box is greyed out.
 - **Enable success audit events**. Use this toggle to enable or disable audit recording of successful Microsoft DKE operations on this endpoint. This is optional. By default, this toggle is turned on.
8. Click **Next**.
9. Under **Key Material**, choose to either create a new key or copy an existing key.

Note

If you do not specify a key, CCKM will automatically create a CipherTrust Manager key for you.

If creating a new key, select **Create New Key**, and enter the **Key Name**. If copying an existing key, select **Copy Existing Key**, and select a **CipherTrust (Local) Key** from the list.

Note

For Copy Existing Key, by default, the Algorithm and Key Size will be **RSA** and **2048**, respectively.

10. Click **Next**.
11. Under **Authorized Tenants**, select the Authorized Tenant from the drop-down list.

Note

Select at least one authorized tenant. Multiple authorized tenants with the same issuer are not allowed.

12. Click **Next**.
13. Under **Review and Add**, review the details you provided for the new endpoint. These details are divided into GENERAL INFO, ENDPOINT SETTINGS, KEY MATERIAL, and AUTHORIZED TENANTS sections.

Note

After the endpoint is added, KEY MATERIAL will no longer be editable.

14. Click **Add Endpoint**.

The endpoint creation starts. A Create Endpoint In Progress message is displayed on the screen. Leave the window open until the process is completed.

15. Click **Close**. The Add Double Key Encryption (DKE) Endpoint wizard is closed.

The newly created endpoint is displayed in the list of Microsoft DKE endpoints.

Viewing DKE endpoints

The **Microsoft Double Key Encryption (DKE)** page shows the list of existing DKE endpoints residing within a given URI hostname. Search for endpoints by endpoint name or key URI.

To view the list of DKE endpoints available on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is displayed. The list of DKE endpoints added to CCKM is displayed. The page displays the following details:

Field	Description
Name	Name of the DKE endpoint.
Key URI Hostname	Base url hostname for KeyURI.
Status	State of the key. The status can be: • Enabled • Disabled
KEK Name	Name of KEK.
Key Version	Version of the key.
Algorithm	DKE key algorithm. The only option currently supported is RSA_DECRYPT_OAEP_2048_SHA256, which is the default value.
Authorization Method	Authorization type for DKE key: Email or Role ID.
Creation Date	Time when the endpoint was created.
Last Modified	Date and time the DKE endpoint was modified. Timestamp in format Day-Month-Year time in 24-hour notation.
Description	Description for the endpoint.

To view the custom columns, click the Customize View (⚙️) icon, select the desired option(s), and click **OK** to display the column(s).

Viewing and editing details of a DKE endpoint

After an endpoint is created, you can view and modify the endpoint details, such as the endpoint name and authorization parameters.

This section describes how to view the details of a DKE endpoint and update details relating to GENERAL INFO, ENDPOINT SETTINGS, and AUTHORIZATION PARAMETERS as needed.

To view and edit the details of Microsoft DKE endpoints on CCKM:

-
1. Log on to the **CipherTrust Manager** GUI as a member of the CCKM Admins group.
 2. Open the **Cloud Key Manager** application.
 3. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is displayed. The list of DKE endpoints added to CCKM is displayed.
 4. Click the **Name** link of the desired DKE endpoint.
Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **View/Edit**.

The edit view of the Microsoft Double Key Encryption (DKE) page is displayed.

Under VERSIONS

1. (Optional) Click **Rotate** to create a new version of the endpoint's encryption key. The Rotate Endpoint dialog box will open.
2. Click **Rotate**.

Under GENERAL INFORMATION

1. (Optional) Update the description of the DKE endpoint in the **Description** field.
2. Click **Update**.

Under ENDPOINT SETTINGS

1. (Optional) Enter a new **Key URI hostname** to use a different URI hostname.
2. (Optional) Depending on current setting, set the **Enable success audit events** toggle to enable or disable audit recording of successful operations related to Microsoft DKE operations on this endpoint.
3. Click **Update**.

Under AUTHORIZED TENANTS

(Optional) Add Authorized Tenants

1. Click **Add Authorized Tenants** to add multiple authorized tenants. The Add Authorized Tenants wizard will open.
2. Select the desired Authorized Tenant(s) from the list.
3. Click **Add Authorized Tenants**.

(Optional) Remove Authorized Tenants

Click the overflow icon () corresponding to the desired authorized tenant, and click **Remove**.

(Optional) View or Edit Authorized Tenants

Click the overflow icon () corresponding to the desired authorized tenant, and click **View/Edit**. Refer to [Managing DKE Authorized Tenants](#).

Under KEY SCHEDULE

1. (Optional) Select a **Rotation** from the drop-down list.
2. Click **Update**.

Enabling a DKE endpoint

From the Microsoft Double Key Encryption (DKE) page, you can enable a DKE endpoint. Enabling a DKE endpoint allows the getkey and decrypt/unwrap operations for the given Microsoft DKE endpoint.

To enable a DKE endpoint on CCKM:

1. Click the **Name** link of the desired DKE endpoint you wish to enable.
The edit view of the Microsoft Double Key Encryption (DKE) page displays.
2. Under the **Actions** drop-down menu, select **Enable**. The **Enable Endpoint** dialog box displays.

Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **Enable**. The **Enable Endpoint** dialog box displays.

3. Click **Enable** to proceed. After the endpoint is successfully enabled, a message displays indicating "Successfully enabled Microsoft DKE endpoint".

Disabling a DKE endpoint

From the Microsoft Double Key Encryption (DKE) page, you can disable a DKE endpoint. Disabling a DKE endpoint disallows the getkey and decrypt/unwrap operations for the given Microsoft DKE endpoint.

To disable a DKE endpoint on CCKM:

1. Click the **Name** link of the desired DKE endpoint you wish to disable.
The edit view of the Microsoft Double Key Encryption (DKE) page displays.
2. Under the **Actions** drop-down menu, select **Disable**. The **Disable Endpoint** dialog box displays.

Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **Disable**. The **Disable Endpoint** dialog box displays.

3. Click **Disable** to proceed. After the endpoint is successfully disabled, a message displays indicating "Successfully disabled Microsoft DKE endpoint".

Rotating a DKE endpoint

From the Microsoft Double Key Encryption (DKE) page, you can rotate a DKE endpoint, which adds a new KEK version to this endpoint. Subsequent encrypt/wrap operations this endpoint performs will use the new version of the key. Decrypt/Unwrap operations will use whichever version of the key was originally used to encrypt/wrap.

Rotating a DKE endpoint's KEK can be done even if the endpoint is disabled. Rotating the KEK regularly is a security best practice.

To rotate a DKE endpoint on CCKM:

1. Click the **Name** link of the desired DKE endpoint you wish to rotate.
The edit view of the Microsoft Double Key Encryption (DKE) page displays.
2. Under the **VERSIONS**, click **Rotate**. The **Rotate Endpoint** dialog box displays.
Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **Rotate**. The **Rotate Endpoint** dialog box displays.
3. Click **Rotate** to proceed. After the endpoint is successfully rotated, a message displays indicating "Successfully rotated Microsoft DKE endpoint". The new key version displays in list of key versions under the **VERSIONS** of the edit view of the Microsoft Double Key Encryption (DKE) page.

Deleting a DKE Endpoint

From the Microsoft Double Key Encryption (DKE) page, you can delete a DKE endpoint. The getkey and decrypt operations associated with this endpoint are also deleted from the database as part of the deletion. Essentially, the record of this endpoint is deleted from the database and CCKM. A deleted endpoint is no longer included in the list DKE endpoints displayed on the Microsoft Double Key Encryption (DKE) page.

Note

Before deleting a DKE endpoint, you must first archive it.

To delete a DKE endpoint on CCKM:

1. Click the **Name** link of the desired DKE endpoint you wish to delete.
The edit view of the Microsoft Double Key Encryption (DKE) page displays.
2. Under the **Actions** drop-down menu, select **Delete**. The **Delete Endpoint** dialog box displays.

Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **Delete**. The **Delete Endpoint** dialog box displays.
3. Enable the **I wish to delete this endpoint** checkbox and click **Delete**. After the endpoint is successfully deleted, a message displays indicating "Successfully deleted Microsoft DKE endpoint".

Archiving a DKE Endpoint

From the Microsoft Double Key Encryption (DKE) page, you can archive a DKE endpoint. Archiving allows you preserve a record of this endpoint in "Archived" state, which can be recovered thereafter.

Note

- An archived DKE endpoint does not consume a CCKM license.
- When a key is in archived state, it can be viewed, recovered, or deleted. It is included in the list of DKE endpoints on the **Microsoft Double Key Encryption (DKE)** page.
- A new KEK version cannot be added to an Archived DKE endpoint as this endpoint cannot be rotated.

To archive a DKE endpoint on CCKM:

1. Click the **Name** link of the desired DKE endpoint you wish to archive.
The edit view of the Microsoft Double Key Encryption (DKE) page displays.
2. Under the **Actions** drop-down menu, select **Archive**. The **Archive Endpoint** dialog box displays.

Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **Archive**. The **Archive Endpoint** dialog box displays.

3. Enable the **I wish to archive this endpoint** checkbox and click **Archive**. After the endpoint is successfully archived, a message displays indicating "Successfully archived Microsoft DKE endpoint".

Recovering a DKE Endpoint

From the Microsoft Double Key Encryption (DKE) page, you can recover a DKE endpoint. Recovering a DKE endpoint in an archived state allows you enable the endpoint thereby allowing subsequent requests for the getkey and decrypt/unwrap operations for the endpoint.

Note

An recovered DKE endpoint consumes a CCKM license.

To recover a DKE endpoint on CCKM:

1. Click the **Name** link of the desired DKE endpoint you wish to recover from an archived state.
The edit view of the Microsoft Double Key Encryption (DKE) page displays.
2. Under the **Actions** drop-down menu, select **Recover**. The **Recover Endpoint** dialog box displays.

Alternatively, click the overflow icon () corresponding to the desired DKE endpoint, and click **Recover**. The **Recover Endpoint** dialog box displays.

3. Enable the **I wish to recover this endpoint** checkbox and click **Recover**. After the endpoint is successfully recovered, a message displays indicating "Successfully recovered Microsoft DKE endpoint".

Managing DKE Authorized Tenants

This section describes how to manage DKE authorized tenants from CCKM.

- Create a DKE Authorized Tenant
- View DKE Authorized Tenants
- View and Edit Details of a DKE Authorized Tenant
- Delete a DKE Authorized Tenant

Creating a DKE Authorized Tenant

To create a DKE authorized tenant from the CCKM GUI:

1. Log in to the **CipherTrust Manager** GUI as a member of the CCKM Admins group.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is displayed.
4. Go to the AUTHORIZED TENANTS section.
5. Click **Create Tenant**. The General Info screen of the **Add Double Key Encryption (DKE) Authorized Tenant** wizard is displayed.

General Info

1. Enter the **Name**
2. Enter the **Description**.
3. Click **Next**. The Issuer Settings screen is displayed.

Issuer Settings

1. Enter a **Valid Issuer**. A trusted issuer for the DKE authorized tenant. An example of a valid issuer is `https://sts.windows.net/<azure_tenant_ID>/`.

Note

The following requirements apply for the issuer:

- Must match the issuer within the JWT that the CCKM receives.

- If the issuer's hostname is `https://sts.windows.net/<azure_tenant_ID>/`, you must include the trailing slash `/`.

2. Click **Next**. The Authorization Parameters screen is displayed.

Authorization Parameters

1. Select an authorization method to the access settings of DKE keys. The options are **Use Email(s)** and **Use Role(s)**.
2. Click the desired tab to view the instructions.

Use Email(s)

Use Email(s) allows your organization to authorize access to the DKE keys based on email addresses.

Under **Add Email(s)**, enter the email addresses that are authorized to use the DKE key and click **Add Email(s)**. The added emails are displayed in the list of Emails.

If you specify one or more email addresses in a DKE endpoint, this field is validated against the User Principal Name (UPN) claim in the JWT received during the decrypt operation. The UPN is the unique sign-in identifier for each user in Microsoft Entra ID. For guest access, where the UPN claim might not be present in the token, the 'email' claim in the token is used instead.

Note

The use of wildcards '*' and '?' are supported for email addresses. The following are examples of supported wildcard formats:

- `abc*@gmail.com`: supports any email that starts with abc and ends with "@gmail.com".
- `abc@?.com`: supports any email that starts with abc, contains "@" followed by at least one character and ends with ".com".
- `abc@?.?*`: supports any email that starts with abc, contains "@" followed by at least one character, followed by the dot character (.), and ends with at least one character.
- `?*@gmail.com`: supports any email that starts with at least one character and ends with "@gmail.com".

Use Role(s)

Use Role(s) allows your organization to authorize access to the DKE keys based on Active Directory groups.

The format is `xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx` where `x` is an alphanumeric character.

From the **Select Azure Connection** drop-down menu, select an Azure connection to use for this DKE authorized tenant, and add the role IDs that are authorized to use the DKE key.

Note

- An [Azure connection](#) must be created for role-based authorization.
- To create this connection, you can either register a new application on the Azure portal or use the application that was registered for DKE. For more information, refer to [Register DKE Service](#).
- The required API permissions for this connection are `User.Read.All` and `RoleManagement.Read.Directory`.
- If you're selecting role as the authorization method, ensure that the tenant ID from the connection must match the tenant ID in the Issuer field.

You can select the roles from the list and you can add the roles manually. Click the desired tab to view the instructions.

List

Click **List Roles** and select the desired roles from the list.

Manually

Scroll down the page, enter the **Role ID(s)** that are authorized to use the DKE key, and click **Add Role ID(s)**. The added role IDs are displayed in the list of Role IDs.

To find out the role ID in Azure:

- a. Log on to the Microsoft Entra portal.
- b. In the left pane, click **Identity > Users > All users**.
- c. On the Users page, search for the desired user.
- d. Under Display Name, click the user name link. The details of the selected user are displayed.
- e. Click **Assigned roles**. The Active assignments tab shows the roles currently assigned to the user.
- f. Note down the role for which you want to find out the role ID.
- g. In the left pane, click **Roles & admins > Roles & admins**. The Roles and administrators page displays all roles on the right.

- h. Search and select the role you noted down earlier. The "<user role> | Assignments" page is displayed.
- i. Under Manage, click **Description**. The Summary of the role is displayed.
- j. Copy the value of the **Template ID**.

3. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the authorized tenant details that you have provided. These details are divided into GENERAL INFO, ISSUER SETTINGS, and AUTHORIZATION PARAMETERS sections.

Before adding the authorized tenant, review all details. After the authorized tenant is added, certain features will no longer be editable.

1. Review the authorized tenant details displayed on the screen.

If the details are incorrect or you want to make any changes, click **Edit** next to the **GENERAL INFO**, **ISSUER SETTINGS**, and **AUTHORIZATION PARAMETERS** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Authorized Tenant**.

3. Click **Close**.

The newly created authorized tenant is displayed in the list of Microsoft DKE authorized tenants.

Viewing DKE Authorized Tenants

The **Microsoft Double Key Encryption (DKE)** page shows the list of existing DKE authorized tenants residing within a given ID. Search for the authorized tenants by name or ID.

To view the list of DKE authorized tenants available on CCKM:

1. Log in to the **CipherTrust Manager** GUI as a member of the CCKM Admins group.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is displayed.
4. Go to the **AUTHORIZED TENANTS** section. The list of DKE authorized tenants added to the CCKM is displayed. The page displays the following details:

Field	Description
Name	Name of the DKE authorized tenant.
Tenant ID	ID of the authorized tenant.
Authorization Method	Authorization type for DKE key: Email or Role ID.

Field	Description
Creation Date	Time when the authorized tenant was created.
Last Modified	Date and time the authorized tenant was modified. Timestamp in format Day-Month-Year time in 24-hour notation.
Description	Description of the authorized tenant.

Viewing and Editing Details of a DKE Authorized Tenant

After an authorized tenant is created, you can view and modify the authorized tenant details, such as the name and authorization parameters.

This section describes how to view the details of a DKE authorized tenant and update details relating to GENERAL INFORMATION and AUTHORIZATION PARAMETERS as needed.

To view or edit a DKE authorized tenant:

1. Log in to the **CipherTrust Manager** GUI as a member of the CCKM Admins group.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is displayed.
4. Go to the AUTHORIZED TENANTS section. The list of DKE authorized tenants added to CCKM is displayed.
5. Click the **Name** link of the desired DKE authorized tenant.

Alternatively, click the overflow icon () corresponding to the desired DKE authorized tenant, and click **View/Edit**.

The edit view of the Microsoft Double Key Encryption (DKE) page is displayed.

Under GENERAL INFORMATION

1. (Optional) Update the **Name**.
2. (Optional) Update the **Description**.
3. Click **Update**.

Under AUTHORIZATION PARAMETERS

1. (Optional) Depending on which authorization method you previously configured:

If using Email authorization

- In **Use Email(s)**, enter additional email addresses and click **Add Email(s)**. Your entries are displayed under **Email(s)**. You can also edit and delete the desired email address by clicking the **Edit** and **Delete**

icon, respectively.

If using Role authorization

- In **Use Role ID(s)**, you can change an Azure connection and add the additional role IDs. You need to click **Edit Authorized Roles**. The Edit Authorized Roles wizard is displayed.
- You can select the roles from the list and you can add the roles manually. Click the desired tab to view the instructions.

List

Select an **Azure Connection**.

Click **List Roles** and select the desired roles from the list.

Click **Edit Authorized Roles**.

Manually

Select an **Azure Connection**.

Scroll down the page, enter the **Role ID(s)** that are authorized to use the DKE key, and click **Add Role ID(s)**. The added role IDs are displayed in the list of Role IDs.

Click **Edit Authorized Roles**.

2. Click **Update**.

Deleting a DKE Authorized Tenant

To delete a DKE authorized tenant from CCKM:

1. Log in to the **CipherTrust Manager** GUI as a member of the CCKM Admins group.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **Services > Microsoft DKE**. The Microsoft Double Key Encryption (DKE) page is displayed.
4. Go to the **AUTHORIZED TENANTS** section.
5. Click the overflow icon () corresponding to the desired DKE authorized tenant, and click **Delete**. The **Delete Authorized Tenant** message is displayed.
6. Select **I wish to delete this authorized tenant**.
7. Click **Delete**.

After the authorized tenant is successfully deleted, a message displays indicating "Successfully deleted Authorized Tenant."

Microsoft DKE service performance summary

We have tested different environments to capture performance metrics for the CipherTrust Cloud Key Manager (CCKM) Microsoft Double Key Encryption (DKE) integration. The performance results provided within this document demonstrate the effects of deployment choices on throughput for Microsoft DKE key encrypt operations for one key. This can help you plan your Ciphertrust Manager deployment to meet your performance needs for Microsoft DKE integration.

All environments used an open source [k6.io](#) tool as the REST client to simulate DKE decrypt requests from Microsoft clients.

Note

- Actual performance numbers in your environment may be different. The results can vary based on factors, such as how and where the CipherTrust Manager is deployed, CipherTrust Manager resources, the location of cloud KMS, the key source of your choice, the network connectivity between the CipherTrust Manager, Microsoft DKE Cloud and your key source, as well as how the traffic is load balanced.
- This document, may at times, abbreviate Ciphertrust Manager as CM.

Tested environments

The following deployments were tested:

- Ciphertrust Manager and K6 client are on Azure
 - Endpoint is configured with email for authentication and tenancy is a single-tenant
 - Endpoint is configured with role for authentication and tenancy is a single-tenant
- Two node cluster of Ciphertrust Manager behind load balancer is on Azure and K6 client is also on Azure
 - Endpoint is configured with email for authentication and tenancy is a single-tenant
 - Endpoint is configured with role for authentication and tenancy is a single-tenant
- Ciphertrust Manager is on AWS and K6 client is on Azure
 - Endpoint is configured with email for authentication and tenancy is a single-tenant
 - Endpoint is configured with role for authentication and tenancy is a single-tenant

The following CipherTrust Manager release version was employed in the tested deployments:

Description	Value
Release version	2.19.0.13525

Test process

The test consisted of starting a given number of Virtual users to perform decrypt operations on the Microsoft DKE key. Each user simulated a separate thread. The total test duration was 40 seconds for each reading.

Microsoft DKE deployment results

- Ciphertrust Manager and K6 client are on Azure
- Two node cluster of Ciphertrust Manager behind load balancer is on Azure and K6 client is also on Azure
- Ciphertrust Manager is on AWS and K6 client is on Azure

Ciphertrust Manager and K6 client are on Azure

Endpoint is configured with email for authentication and tenancy is a single-tenant

4 CPU 16 GB

Here are the details of this deployment:

CM details

CM environments	Volume	CPU	Memory	Authentication	Tenancy
Ciphertrust Manager (Azure)	50 GB	4	16 GB	Email	Single-tenant

K6 details

K6	Volume	CPU	Memory
K6 client (Azure)	50 GB	8	64 GB

Results

Virtual users	Run time (seconds)	Operations/seconds	Time taken (P90) (seconds)

14000	40	929.9176/s	21.49

Endpoint is configured with role for authentication and tenancy is a single-tenant

4 CPU 16 GB

Here are the details of this deployment:

CM details

CM environments	Volume	CPU	Memory	Authentication	Tenancy
Ciphertrust Manager (Azure)	50 GB	4	16 GB	Role	Single-tenant

K6 details

K6	Volume	CPU	Memory
K6 client (Azure)	50 GB	8	64 GB

Results

Virtual users	Run time (seconds)	Operations/seconds	Time taken (P90) (seconds)
200	40	70.588858/s	3s
400	40	73.897893/s	6.41s
600	40	73.435278/s	11.37s
800	40	71.563103/s	14.87s
1000	40	59.223803/s	18.47s
1200	40	68.782213/s	23.68s
1400	40	63.355995/s	27.76s
1600	40	69.152327/s	27.5s
1800	40	66.602176/s	31.89s
2000	40	64.757942/s	35.27s
2200	40	55.541948/s	37.44s

8 CPU 64 GB

Here are the details of this deployment:

CM details

CM environments	Volume	CPU	Memory	Authentication	Tenancy
Ciphertrust Manager (Azure)	50 GB	8	64 GB	Role	Single-tenant

K6 details

K6	Volume	CPU	Memory
K6 client (Azure)	50 GB	8	64 GB

Results

Virtual users	Run time (seconds)	Operations/seconds	Time taken (P90) (seconds)
500	40	121.0911/s	4.3
1000	40	152.8317/s	8.54
1500	40	154.01/s	13.5
2000	40	123.0743/s	19.4
2500	40	149.6086/s	23.22
3000	40	147.4008/s	28.78
3500	40	144.5733/s	34.89
4000	40	135.8877/s	40.77
4500	40	138.8102/s	43.15
5000	40	130.9184/s	50.3
5500	40	140.8138/s	50.65
6000	40	148.9094/s	50.56

Conclusion

- Increasing CM RAM and CPU increases the performance.

- Increasing the number of nodes enhances the performance.

- The performance is better when the endpoint is configured with the email as compared to the role.

- The performance is better when the server and client are geographically close compared to when they are far apart.

Sizing the environment

To size the environment, you must evaluate the peak traffic of DKE by establishing the maximum number of requests hitting the DKE infrastructure. The following factors must be considered.

- The number of total users.
- The geographic distribution and flexibility in working hours.
 - Suppose a 100k users company named ABC is located in a one-time zone only. All of its employees have a shift from 9 am to 5 pm. So, there might be 95k users opening one particular DKE-protected email or document within 5 minutes at the start of their shift, which is 320 requests per second. The peaks likely exceed 1000 requests per second.
 - But suppose a 100k users company named XYZ is evenly distributed among 10 different time zones across the world. All of its employees have flexible working hours. A document opened at the start of their shift may be opened by 10k users in a 20-minute window, which is 10 requests per second. The peaks are likely below 50 requests per second.
- The usage of DKE in the protection of emails and documents. On an hourly basis, a user may open 20 DKE-

protected emails and up to 2 DKE-protected documents.

- Accessing the DKE templates and client configuration offline.
 - If a DKE-protected email thread or document is available offline for 7 days, opening it will result in one request per user.
 - If the offline caching is disabled, editing the same email thread or document may result in several requests per hour. At least one request each time the same user opens the same email or document.
- The number of total DKE-protected emails or documents opened by the average user on a daily basis.
 - If only the most sensitive content is DKE-protected, an average ABC user may access 2 DKE-protected emails or documents per day. It will generate 200k requests per day, which is less than 10 requests per second.
 - If all emails and documents are DKE-protected, the 100k users of XYZ can access 50 DKE-protected emails or documents per day. It may generate nearly 200 requests per second even with offline access, which is likely 500 requests without offline access.

To ensure high availability, DKE infrastructure must be fault-tolerant, behind a network load balancer.

If you already have the Managed Service Providers, a good way to estimate the load is by checking the number of documents accessed with the highest classifications like Strictly Confidential.

External CipherTrust Resources

This section describes prerequisites to manage the external CipherTrust resources on CCKM.

Prerequisites

Before you can use an external CipherTrust Manager as a key source in CCKM:

1. Make sure that the external CipherTrust Manager is installed and configured. Refer to [CipherTrust Manager Deployment](#) for details.
2. After the external CipherTrust Manager is configured, configure the connection to the external CipherTrust Manager. Refer to [Connection Manager](#) for details.

After ensuring the prerequisites, the CipherTrust Manager keys can be managed on the CipherTrust Manager. Refer to the following sections:

- [Managing External CipherTrust Domains](#)
- [Managing External CipherTrust Keys](#)

Managing External CipherTrust Domains

This section describes how to manage external CipherTrust domains on CCKM.

Before proceeding, make sure to fulfill [prerequisites](#).

Adding CipherTrust Domains

To add a CipherTrust domain to CCKM:

1. Log on to the **CipherTrust Manager** GUI as administrator.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **KMS Containers > CipherTrust Domains**. The CipherTrust Domains page is displayed.
4. Click **Add Domain**. The Add Existing Domain page is displayed.
5. From the **Connection** drop-down list, select the desired CM connection to the CipherTrust Manager.
6. Click **Save**.

The CipherTrust domain is added to CCKM.

A message **CipherTrust Domain added successfully** is displayed on the screen.

Refreshing CipherTrust Domains

Refreshing is the process of downloading keys created on the CipherTrust domains to CCKM.

Refreshing All Domains

To refresh all CipherTrust domains:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Ciphertrust Domains**. CipherTrust Domains page is displayed. This page displays the list of CipherTrust Domains.
3. Click **Refresh All**. The "This may take a while..." message is displayed.

Note

Refreshing CipherTrust domains is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed domains are listed on the **Cloud Keys > CipherTrust > CipherTrust (External) Keys** page. Refer to [Viewing CipherTrust \(External\) Keys](#) for details.

Viewing/Editing Details of CipherTrust Domains

The CipherTrust Domains page shows the list of existing CipherTrust domains. Search for domains by Domain Name or Connection.

Viewing CipherTrust Domains Details

To view the details of CipherTrust domains:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > CipherTrust Domains**. The CipherTrust Domains page displays the following details.

Column	Description
Domain Name	Name of the CipherTrust domain. Click the link to view more details about the domain.
Connection	Name of the CipherTrust connection.
Creation	When the domain was created.
Updated	When the domain was updated.

|Last Refreshed|When the domain was last refreshed. `Never` is displayed for domains that are never refreshed.|

Click the Customize View () icon, select the desired option, and click **OK** to display the column.

Modifying CipherTrust Domain Details

To modify the details of a CipherTrust domain:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > CipherTrust Domains**. The CipherTrust Domains page displays the list of added CipherTrust domains.
3. Click the overflow icon () corresponding to the desired CipherTrust domain and click **View/Edit Details**.

You can change the CM connection and its description, and modify user/group permissions on the CipherTrust domain. For details, refer to:

- [Changing the CM Connection](#)
- [Managing User Permissions on CipherTrust Domains](#)

Changing the CM Connection

To change the CM connection:

1. Expand **GENERAL INFO**.
2. From the **Connection** drop-down list, select the desired CM connection.
3. Click **Update**.

A message **Updated connection for this domain** is displayed on the screen.

Managing User Permissions on CipherTrust Domains

To work with CipherTrust, users/groups must have the minimum set of permissions that allow them to use the CipherTrust resources such as CipherTrust keys and domains. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on the CipherTrust domain.

To add permission for a user/group:

1. Expand **ACCESS CONTROL**.
2. In the **ACCESS CONTROL** section, click **Assign User/Group**. The **Assign User/Group** screen is displayed.
3. From the **User/Group** drop-down list, select the user or group to be assigned permissions.
4. Click **Save**.

The newly added user/group is displayed under **Name** in the **ACCESS CONTROL** section.

CCKM allows the following operations on the CipherTrust domains:

- View Keys, Add Key, Delete Key
- Refresh Domain

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. Select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A message **Updated access control for this Project** is displayed on the screen.

Removing a Permission

To remove a permission assigned to a user or group:

1. Clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A message **Updated access control for this Project** is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. Under **Unassign**, click the **X** button corresponding to the desired user/group. The **Remove User / Remove Group** screen is displayed.

Note

Removing this user/group will remove all permissions currently assigned to the user/group. Are you sure you want to continue?

2. Click **Remove**.

A message **Updated access control for this Project** is displayed on the screen.

Deleting CipherTrust Domains

To delete a CipherTrust domain:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > CipherTrust Domains**. The CipherTrust Domains page is displayed. The CipherTrust Domains page displays the list of added CipherTrust Domains.
3. Click the overflow icon () corresponding to the desired CipherTrust Domain and click **Delete**. The **Delete CipherTrust Domain** screen is displayed.
4. Click **Domain**.

A message **CipherTrust Domain deleted successfully** is displayed on the screen.

Managing External CipherTrust Keys

This section describes how to manage CipherTrust keys or CipherTrust (External) keys on CCKM. Before

proceeding, you must have an CipherTrust domain added to the CCKM. Refer to [Managing CipherTrust Domains](#) for details.

Adding CipherTrust (External) Keys

To add a CipherTrust (External) key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The list of available CipherTrust (External) keys is displayed.
3. Click **Add Key**. The Add CipherTrust (External) Key screen of the Add CipherTrust (External) Key wizard is displayed.

Add CipherTrust (External) Key

1. **Select Domain** for the key. The key will be added to this domain.
2. (Optional) Enter the **Key Name**. This helps in uniquely identifying a key.
3. Select the key **Algorithm**. The algorithm can be AES (default), TDES, RSA, Elliptic Curve, HMAC-SHA1, HMAC-SHA256, HMAC-SHA384, and HMAC-SHA512.
4. Select the **Key Size** or **Curve**.

Note

If the algorithm is not Elliptic Curve, select the **Key Size**. If the algorithm is Elliptic Curve, select the **Curve**.

5. (Optional) Select the **Key Attributes**. The supported attributes are **Exportable** and **Deletable**.
6. (Optional) Select the **Key Usage(s)**.
7. (Optional) Enter **KMIP Mask Shorthand**.
8. (Optional) Enter **Labels**. A label is a label assigned to the key that consists of a user-defined key and a value.

To add a label:

- a. Specify a label name.
- b. Specify the label value.
 - CCKM allows the following characters in label values:
 - Alphanumeric characters

- Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; . ' " _ **`

- CCKM does not allow the colon (:) in label values.

c. Click the **+** button.

Similarly, you can add more labels. To remove a label, click the close (X) icon in the label name.

9. Click **Next**. The Review and Add screen is displayed. This screen shows the key details.

Tip

Before adding the CipherTrust (External) key, it is recommended to review its details. After the key is added, its certain features cannot be edited.

Review And Add

1. Review the key details. If the key requires any changes, click the **Back** link and modify the details.
2. Click **Save**.

After the key is created successfully, a success message **Key added successfully.** is displayed.

3. Click **Close**.

The newly created key is displayed in the keys list.

Viewing CipherTrust (External) Keys

The CipherTrust (External) Keys page displays the available CipherTrust (External) keys. Search for CipherTrust (External) keys by Key Name or UUID (Universally Unique Identifier) of the key.

To view a CipherTrust (External) key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The CipherTrust (External) Keys page displays following details:

Field	Description
Key Name	Name of the CipherTrust (External) key. Click to view details of keys. Refer to Viewing CipherTrust (External) Keys for details.
Status	State of the Google Cloud key. The status can be: • Active

Field	Description
	• Pre-Active • Deactivated • Destroyed • Compromised • Destroyed Compromised • Deleted
Version	Version of the CipherTrust (External) key.
Owner	Owner of the CipherTrust (External) key.
Creation Date	Time when the key is added to CCKM.
Type	Type of the CipherTrust (External) key - Symmetric, Public, or Private.
Algorithm	Algorithm of the CipherTrust (External) key. The algorithm can be: • AES • TDES • RSA • Elliptic Curve • HMAC-SHA1 • HMAC-SHA256 • HMAC-SHA384 • HMAC-SHA512.
Size	Size of the CipherTrust (External) key.
Domain	ID of the CipherTrust domain where the key is created. Click on the ID to view the details of the domain.

To hide/display columns, click the Customize View (⚙️) icon, select or clear the desired check boxes, and click **OK**.

Viewing or Editing Details of CipherTrust Keys

To view or edit a CipherTrust key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The list of available CipherTrust (External) keys is displayed.
3. Click the overflow icon (⋮) corresponding to the desired key and click **View/Edit Details**. Alternatively, you can click the key name link. The edit view of the key is displayed. The edit view is divided into:

-
- **GENERAL INFO:** View the key ID and add tags. Refer to [Adding/Removing Tags](#) for details.
 - **GENERAL INFO:** Add or update the Key Attributes, Key Usages, KMIP Mask Shorthand, Labels, and Key Metadata. Refer to [Updating General Info](#) for details.
 - **DATES:** Add and updated the deactivation date, protect start date, and protect stop date of the key. Refer to [Adding and Updating Dates](#)
 - **KEY SCHEDULE:** Add, update, and disable a key rotation schedule. Refer to [Adding or Changing Key Rotation Schedule](#) and [Disabling Key Rotation Schedule](#).
 - **KEY VERSIONS:** View details of key versions. Refer to [Viewing Key Version Details](#).

Updating General Info

1. Expand the GENERAL INFO section, if needed.
2. Add or update the following details.

- a. **Key Attributes**

- b. **Key Usages**

- c. **KMIP Mask Shorthand**

- d. **Labels.**

To add a label:

- a. Specify a label name.
 - b. Specify the label value.
 - CCKM allows the following characters in label values:
 - Alphanumeric characters
 - Special characters `** ! @ # $ % ) ( { } > < ? + - / \ [ ] ^ & + = | ~ ` , ; . ' " _ **`
 - CCKM does not allow the colon (:) in label values.
 - c. Click the + button.

Similarly, you can add more labels. To remove a label, click the close (X) icon in the label name.

- e. **Key Metadata**

3. Click **Update**.

Adding and Updating Dates

1. Expand the **DATES** section.
2. Add or Update **Deactivation Date**.
3. Add or Update **Process Start Date**.
4. Add or Update **Protect Stop Date**.
5. Click **Update**.

Viewing Key Version Details

To view the details of key versions, expand the **KEY VERSIONS** section. The list of key versions with their details are displayed:

Field	Description
Version	Version of the CipherTrust (External) key.
ID	
Status	State of the Google Cloud key. The status can be: • Active • Pre-Active • Deactivated • Destroyed • Compromised • Destroyed Compromised • Deleted
Exportable	
Deletable	
Never Exported	
Never Exportable	
Created	Time when the version is created.
Modified	Time when the version is modified.

Refreshing CipherTrust (External) Keys

Refreshing is the process of downloading keys from configured CipherTrust domains and updating their details on the CCKM GUI. You can refresh keys of all domains at once.

To refresh keys of all domains:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The list of available CipherTrust (External) keys is displayed.

3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refreshing all CipherTrust domains is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > CipherTrust > CipherTrust Keys** page.

Adding a Key Version

To add a new key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The list of available CipherTrust (External) keys is displayed.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Add Version**. The Add Version dialog box is displayed.
5. Click **Yes, Add Version**. A success message **Version added successfully.** is displayed.

A new version is added to the key. The Version Count increases by one on the CipherTrust (External) keys page.

Deleting CipherTrust (External) Keys

To delete a CipherTrust (External) key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The list of available CipherTrust (External) keys is displayed.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Delete**. The Delete Key dialog box is displayed.
5. Click **Delete Key**.

A success message **Delete is in progress** is displayed. It may take some time to reflect the changes. After a key is deleted, its status becomes **DeLeted** on the CipherTrust (External) Keys page.

Deleting a Key Version

To delete a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > CipherTrust**. The list of available CipherTrust (External) keys is displayed.
3. Click the **Key Name** link of the desired key.

Alternatively, click the overflow icon () corresponding to the desired key and click **View/Edit**.

4. Expand **VERSIONS**.
5. Click the overflow icon () corresponding to the desired key version.
6. Click **Delete**. The Delete Version dialog box is displayed.
7. Click **Delete Key Version**.

A success message **Version deleted successfully**. is displayed. After a key version is deleted, its status becomes **DeletEd**.

DSM Resources

This section describes prerequisites to manage DSM resources on CCKM.

Prerequisites

Before you can use a DSM as a key source in CCKM:

- The DSM must be installed and configured and the DSM server certificate must be downloaded.
- A connection to the DSM must be configured on the CipherTrust Manager.

Refer to the sections below.

On the DSM

For any DSM you plan to use as key source, a DSM administrator must:

1. Install and configure a DSM. Refer to the latest version of the DSM Administration Guide.

Note

When adding a connection to the DSM on the CipherTrust Manager, you need to enter the DSM account information you gather during the installation and configuration of the DSM.

2. Create a DSM administrator account of type **All** or **Domain and Security Administrator** for CCKM. These administrators can create keys on the DSM.
3. Note the following information:
 - DSM fully-qualified host name and IP address.
 - Name and password of the DSM administrator created in previous step.
4. Export the DSM server certificate to your laptop or desktop using the Chrome Internet browser.

CCKM performs key operations through REST APIs exposed in the DSM. CCKM requires the DSM server certificate to invoke the APIs. When adding connection to the DSM as your key source, you need to upload the DSM certificate to the CipherTrust Manager.

Note

The steps to export a DSM server certificate using other browsers (for example, Firefox) may differ slightly.

To export your DSM server certificate from DSM using the Chrome browser:

- a. Enter `https://<DSM IP address>` in a browser. The DSM user login page is displayed.
- b. Log on to the web-based management console of the DSM.
- c. In the web URL, click the **Not Secure** section and click **View Certificate**.
- d. Click the **Details** tab of the certificate.
- e. Click **Copy to File**. The **Certificate Export Wizard** is displayed. This wizard is used to export your certificate in the appropriate format.
- f. On the **Export File Format** page, select the **Base-64 encoded X.509 (.CER)** format option.
- g. Click **Next**.
- h. On the **File to Export** page, enter the directory to which to save the file on your laptop or desktop and

specify the file name (for example, **DSM.cer**).

- i. Click **Finish** to complete the export.

You need to upload this DSM server certificate to the [DSM Connection](#) page of the CipherTrust Manager when adding a connection to the DSM as your key source.

On the CipherTrust Manager

After the DSM is configured and the DSM certificate is downloaded, a CipherTrust Manager configures the connection to the DSM. Refer to [Connection Manager](#) for details.

After ensuring the prerequisites, DSM domains and DSM keys can be managed on the CipherTrust Manager. Refer to the following sections:

- [Managing DSM Domains](#)
- [Managing DSM Keys](#)

Managing DSM Domains

This section describes how to manage DSM domains on CCKM.

Before proceeding, make sure to fulfill [prerequisites](#).

Adding DSM Domains

To add a DSM domain to CCKM:

1. Log on to the **CipherTrust Manager** GUI as administrator.
2. Open the **Cloud Key Manager** application.
3. In the left pane, click **KMS Containers > DSM Domains**. The DSM Domains page is displayed.
4. Click **Add Domain**. The Add Existing Domain page is displayed.
5. From the **Connection** drop-down list, select the desired connection to the DSM.
6. From the **Domain** drop-down list, select the desired DSM domain. The drop-down list shows existing domains of the DSM linked to the selected connection.

Tip

Select multiple DSM domains to add them at once.

7. Click **Add**.
-

The DSM domain is added to CCKM.

A message **Domain added successfully...** is displayed on the screen.

Refreshing DSM Keys

Refreshing is the process of downloading keys created on the DSM domains to CCKM. Refresh can be achieved using any of the following ways:

- [Refreshing Specific Domains](#)
- [Refreshing All Domains](#)

Refreshing Specific Domains

To refresh a specific domain:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > DSM Domains**. The DSM Domains page is displayed. This page displays the list of DSM domains.
3. Click the overflow icon () corresponding to the desired DSM domain and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

After successful refresh, the refreshed keys are listed on the **Cloud Keys > DSM > DSM Keys** page. Refer to [Viewing DSM Keys](#) for details.

Refreshing All Domains

To refresh all DSM domains:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > DSM Domains**. The DSM Domains page is displayed. This page displays the list of DSM domains.
3. Click **Refresh All**. The "This may take a while..." message is displayed.

Note

Refreshing all DSM domains is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > DSM > DSM Keys** page. Refer to [Viewing DSM Keys](#) for details.

Viewing/Editing Details of DSM Domains

The DSM Domains page shows the list of existing DSM domains. Search for domains by Domain Name or Connection.

Viewing DSM Domains Details

To view the details of DSM domains:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > DSM Domains**. The DSM Domains page displays the following details.

Column	Description
Domain Name	Name of the DSM domain. Click the link to view more details about the domain.
Connection	Name of the DSM connection.
Admin Type	Type of the DSM administrator linked with the domain. The type can be: • SYSTEM_ADMIN • DOMAIN_ADMIN • SECURITY_ADMIN • SECURITY_AND_DOMAIN_ADMIN • ALL_ADMIN
Last Refreshed	When the domain was last refreshed. Never is displayed for domains that are never refreshed.
Created At	When the domain was created.

Click the Customize View () icon, select the desired option, and click **OK** to display the column.

Modifying DSM Domain Details

To modify the details of a DSM domain:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > DSM Domains**. The DSM Domains page displays the list of added DSM domains.
3. Click the overflow icon () corresponding to the desired DSM domain and click **View/Edit Details**.

You can change the DSM connection and its description, and modify user/group permissions on the DSM domain. For details, refer to:

- [Changing the DSM Connection](#)
- [Managing User Permissions on DSM Domains](#)

Changing the DSM Connection

To add permission for a user/group:

1. Expand **GENERAL INFO**.
2. From the **Connection** drop-down list, select the desired DSM connection.
3. Click **Update**.

A message **Updated connection for this domain** is displayed on the screen.

Managing User Permissions on DSM Domains

To work with DSM, users/groups must have the minimum set of permissions that allow them to use the DSM resources such as DSM keys and domains. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on the DSM domain.

To add permission for a user/group:

1. Expand **ACCESS CONTROL**.
2. In the **ACCESS CONTROL** section, click **Assign User/Group**. The **Assign User/Group** screen is displayed.
3. From the **User/Group** drop-down list, select the user or group to be assigned permissions.
4. Click **Save**.

The newly added user/group is displayed under **Name** in the **ACCESS CONTROL** section.

CCKM allows the following operations on the DSM domains:

- View Keys, Add Key, Edit Key, Delete Key
- Refresh Domain
- Remove

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. Select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A message **Updated access control for this domain** is displayed on the screen.

Removing a Permission

To remove a permission assigned to a user or group:

1. Clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A message **Updated access control for this domain** is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. Under **Remove**, click the **X** button corresponding to the desired user/group. The **Remove User / Remove Group** screen is displayed.
2. Click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group. Are you sure you want to continue?

3. Click **Remove**.

A message **Updated access control for this key domain** is displayed on the screen.

Deleting DSM Domains

To delete a DSM domain:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > DSM Domains**. The DSM Domains page displays the list of added DSM domains.

- Click the overflow icon () corresponding to the desired DSM domain and click **Delete**. The **Delete DSM Domain** screen is displayed.

Warning

The deleted domain's keys will no longer be available on the DSM Keys page, but the keys will still exist on the DSM. If you later add this domain with the same ID, the keys will be available again.

- Select **I wish to delete this domain**.
- Click **Delete Domain**.

A message **Domain deleted successfully** is displayed on the screen.

Managing DSM Keys

This section describes how to manage DSM keys on CCKM. Before proceeding, you must have a DSM domain added to the CCKM. Refer to [Managing DSM Domains](#) for details.

CCKM supports two types of DSM keys:

- **Symmetric:** A randomly generated key is used to encrypt and decrypt the data.
- **Asymmetric:** A public and private RSA key pair is used to encrypt and decrypt the data. The public key encrypts while the private key decrypts the data.

Adding DSM Keys

To add a DSM key:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Cloud Keys > DSM**. The list of available DSM keys is displayed.
- Click **Add Key**. The Add DSM Key dialog box is displayed.
- On the **Add DSM Key** screen:
 - Select Encryption Type.** The options are **Symmetric** and **Asymmetric**. Depending on the selected encryption type, the **Algorithm** option change. Also, the **Encryption Mode** field is displayed for symmetric keys.
 - Specify a **DSM Key Name**. This helps in uniquely identifying a key. The key name is mandatory.
 - Provide a **Description** of the key.
 - Select the desired **DSM Domain** for the key. The key will be added to this domain. The DSM domain is

mandatory.

- e. (Optional) Select **Expiration Date**. The key will expire on this date and time.

When you select **Expiration Date**, the **UTC** field appears under it. Click the field and use the on-screen calendar to specify the key expiration date and time. Alternatively, you can manually specify the expiration date and time in the format, **MM/DD/YYYY 00:00**.

Note

Make sure the expiration time exists in the future, otherwise, the key creation fails with an error.

- f. (Optional) Select **Extractable**. If selected, the key material created on the DSM can be extracted for management from CCKM.
- g. Select the key **Algorithm**. The algorithm is mandatory. Based on the encryption type, the supported algorithms are:
- **Symmetric**: AES-128, AES-256, ARIA-128, and ARIA-256.
 - **Asymmetric**: RSA-1024, RSA-2048, RSA-3072, and RSA-4096.
- h. (Optional, applicable to symmetric keys) Select the **Encryption Mode**. The options are CBC, CBC-CS1, and XTS.
- i. Click **Next**. The Review DSM Key screen is displayed. This screen shows the key details.

Tip

Before adding the DSM key, it is recommended to review its details. After the key is added, its certain features cannot be edited.

5. On the **Review DSM Key** screen:

- a. Review the key details. If the key requires any changes, click the **Edit** link and modify the details.
- b. Click **Create**.

The message **Create Key is in progress** is displayed. It may take some time to create the key. Leave the window open until the key creation process is complete. After the key is created successfully, a success message **Your key was successfully created. Close window to return to all keys.** is displayed.

- c. Click **OK**.

The newly created key is displayed in the keys list.

Note

Creation of a DSM key fails if:

- The selected DSM domain is full. If the key creation fails, ensure enough free disk space is available on the domain and retry the key creation.
- The DSM user credentials are incorrect or the password has expired. Check the credentials or reset the user password, as appropriate, test the connection, and retry the key creation.
- The DSM domain admin is different from the DSM admin used for creating the DSM connection.

Viewing DSM Keys

The DSM Keys page displays the available DSM keys. Search for DSM keys by Key Name or UUID (Universally Unique Identifier) of the key.

To view a DSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > DSM**. The DSM Keys page displays following details:

Field	Description
Key Name	Name of the DSM key. Click to view details of keys. Refer to Viewing DSM Keys for details.
State	State of the DSM key - ACTIVE or DELETED.
UUID	UUID of the DSM key.
Key Type	Type of the DSM key - Symmetric or Asymmetric.
Algorithm	Algorithm of the DSM key. The algorithm can be: Symmetric • AES128 • AES256 • ARIA128 • ARIA256 Asymmetric • RSA1024 • RSA2048 • RSA3072 • RSA4096

Field	Description
Creation Date	Time when the key is added to CCKM.
Expiration Date	Time when the DSM key will expire.
Domain Name	Name of the DSM domain where the key is created.
Versioned	Whether the DSM key is versioned.

To hide/display columns, click the Customize View (⚙️) icon, select or clear the desired check boxes, and click **OK**.

Viewing Details of a DSM Key

The DSM Keys page displays the list of available keys with their details. After a key is created, you can view its description, the key name, encryption type, domain, algorithm, and encryption.

The key description is displayed under the GENERAL INFO section and key versions are displayed under the KEY VERSIONS section.

To view details of a DSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > DSM**. The list of available DSM keys is displayed.
3. Click the **Key Name** link of the desired key. The mini detail view displays the key details.

Alternatively, click the overflow icon (⋮) corresponding to the desired key and click **View/Edit**.

The KEY VERSIONS section shows the following details:

Field	Description
Key Hash	Hash of the DSM key.
Version	Version of the DSM key.
State	State of the key - ACTIVE or DELETED.
Algorithm	Algorithm of the key.
Creation Date	Time when the key is added to CCKM.
Expiration Date	Time when the DSM key will expire.
Reason Key Was Rotated	Explains why the key is rotated.

Refreshing DSM Keys

Refreshing is the process of downloading keys from configured DSM domains and updating their details on the CCKM GUI. You can refresh keys of all domains at once.

To refresh keys of all domains:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > DSM**. The list of available DSM keys is displayed.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refreshing all DSM Domains is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > DSM > DSM Keys** page.

Deleting DSM Keys

To delete a DSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > DSM**. The list of available DSM keys is displayed.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Delete**. The Delete Key dialog box is displayed.
5. Select **I wish to delete this key**.
6. Click **Delete**.

A success message **Delete is in progress** is displayed. It may take some time to reflect the changes. After a key is deleted, its status becomes **DeLeted** on the DSM Keys page.

Scheduling Operations

CCKM allows you to periodically refresh keys in the background. To refresh keys, you need to create schedule configuration. A schedule configuration defines when to run a refresh job. You can use either basic format or cron format to specify the time when the refresh job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- **Repeats:** frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- **at:** specific time at which the refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

" * * * * * "

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Refresh Schedule

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. Under Select Schedule Type, select **Key Refresh**.
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **DSM** from the **Cloud Name** drop-down list.
 - (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.

- a. Configure **DURATION** for the scheduler. Specify the following values:

- **Schedule Starts**
- **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will refresh keys. Select either **Basic** or **Raw (Cron)** format to specify the value.

- c. Click **Next**.

8. On the **Add Domains** screen:

- a. Select the domain name from the **Refresh Keys from Selected Domain(s)** drop-down list.
- b. Click the **+** button.

Similarly, you can add more domains.

- c. Select the **Refresh All Domains** option if you want to refresh all the existing domains.
- d. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only) For DSM, only Key Refresh is supported.
Cloud Name	Name of the cloud. For DSM schedules, it is DSM.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.

Field	Description
Start Date	Start time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

- Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.
- Edit or configure the following fields:

GENERAL INFO: Update the general information about the schedule:

- Update **Description** of the schedule.
- Enable or disable the scheduler configuration. Select or clear the **Enable Schedule** check box.

SCHEDULE CONFIG: Update the scheduler configuration parameters such as:

- DURATION:** Specify the period in which a schedule actively runs its jobs. Specify **Schedule Starts** and **Schedule Ends** dates. If you select **Never**, the schedule never expires.
- FREQUENCY:** Specify how often the schedule refreshes domains. Use **Basic** or **RAW (Cron)** option to specify the frequency.

DOMAINS: Under **Refresh Keys from Selected Domain(s)**:

- Add a new domain to the key refresh schedule.
- Remove an existing domain from the key refresh schedule.

- Click **Update** under each modified section.

The Schedules page also contains a section named **JOB HISTORY** that contains all the related information about a schedule such as **Run Date**, **Job ID**, **Status**, and **Errors**.

Disabling Schedules

To disable a schedule configuration:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Schedules**. The list of available schedules is displayed.
- Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.

-
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish**. is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Google Cloud Resources

Google Cloud resources include Google Cloud projects, key rings, and keys. Manage Google Cloud keys stored in key rings linked to Google Cloud projects in your Google Cloud service account using CCKM.

The high-level steps are:

1. Complete the [prerequisites](#).
2. Fetch the list of Google Cloud projects linked with your account. Note down the project IDs, they are needed when viewing and creating key rings inside projects.
3. Get the list of available Google Cloud locations (regions). These are required when viewing the key rings linked with a project in a location.
4. View the list of key rings in a linked Google Cloud project. Specify the connection name, project ID, and project location. You will add desired key rings to the CipherTrust Manager.
5. Add the desired key rings to the CipherTrust Manager. Specify the connection name, project ID, and key rings (array).

The key rings are displayed on the CipherTrust Manager. You can manage the added key rings and their keys from CCKM.

6. Manage keys. Add new native Google Cloud keys, create and upload keys based on external key source, manage key versions, and remove keys.

Note

CCKM doesn't support Google BYOK for Google Trusted Partner Clouds (TPC).

Prerequisites

Before you can manage Google Cloud resources on CCKM:

1. [Create a Project Using an Organization](#)
2. [Create a Project Using GCP User Not Belonging to an Organization](#)
3. [Enable Billing on the Project](#)
4. [Enable the Required APIs](#)
5. [Create a Key Ring](#)
6. [Create a Service Account](#)
7. [Grant the Service Account Access to Resources](#)
8. [Add Google Connection on CipherTrust Manager](#)

Note

You must increase the number of CCKM KMS API quotas for the projects you plan to add to CCKM. The recommended quota range is 800–1000 read/write operations. For more information, see [View and manage quotas](#).

Create a Project Using an Organization

The Organization resource is the root in the Google Cloud Platform (GCP) resource hierarchy. An organization can contain folders which can contain projects which can contain resources such as Google Cloud KMS. Refer to [Google Cloud resource hierarchy](#) for details.

To get an organization resource, sign up for Google Workspace or Cloud Identity and verify your domain. One Google Workspace or Cloud Identity account contains exactly one organization resource.

After you have an organization, you can optionally create folders to organize your projects. Finally, create a project. Refer to [Creating and Managing Organizations](#) for details.

Create a Project Using GCP User Not Belonging to an Organization

It is recommended to create a project using a GCP user that does not belong to an organization.

An existing GCP user can create projects even if the user does not belong to an organization. The projects and all resources under them are tied to the user account that is an employee in the company. If the employee leaves the company, the project is deleted with the user.

When creating a project with a user account, the default organization is "No Organization".

Enable Billing on the Project

If using an Organization, make sure you have the Billing Account Administrator role before performing the following steps.

1. Sign in to the [Manage billing accounts](#) page in the Google Cloud Console.
2. Add a billing account. Refer to [Create, modify, or close your Cloud Billing account](#) for details.
3. On the Billing page, click the **MY PROJECTS** tab to view the list of projects.
4. Click the menu (three vertical dots) for the project that you want to enable billing for.
5. Select **Change billing**.
6. Select the desired billing account.
7. Click **Set account**.

Refer to [Enable, disable, or change billing for a project](#) for more details on managing billing for a project.

Enable the Required APIs

1. Sign in to the [Google Cloud Console](#).
2. In the search bar **Search products and resources**, search for:
 - Cloud Key Management Service (KMS) API and enable the API.
 - Cloud Resource Manager API and enable the API.

Create a Key Ring

1. Sign in to the [Google Cloud Console](#).
2. Go to the left navigation menu.
3. Click **Security > Key Management**.
4. Create a key ring.

Create a Service Account

1. Sign in to the [Google Cloud Console](#).
2. Go to the left navigation menu.
3. Click **IAM & Admin > Service Accounts**.
4. Create a service account.

Grant the Service Account Access to Resources

IAM permissions are grouped into roles. Roles are assigned to members on resources. GCP provides predefined roles, but you can create your own custom roles, if required.

To manage Google Cloud keys in the key ring you created [above](#) using CCKM, assign the following roles to the service account:

- The **Browser** (`roles/browser`) role on the project that contains the key ring
- The **Cloud KMS Admin** (`roles/cloudkms.admin`) role on the key ring you created
- The **Logs Viewer** (`roles/logging.viewer`) role on the key ring you created

Note

- Search for the roles listed above using `name:roles/<rolename>`

- You can also assign the service account the role of **Resource Manager Organization Viewer** (`roles/resourcemanager.organizationViewer`). Assigning this role allows CCKM users to see the display name of the organization resource, instead of seeing only its ID.

Permissions are inherited down the GCP resource hierarchy. Therefore, you can also grant the service account the previous roles at the organization level, folder level, or project level.

To create custom roles for your service account, refer to the following mapping of CCKM actions to IAM KMS permissions.

CCKM Action	Cloud IAM KMS Permissions
Synchronize	cloudkms.keyRings.list cloudkms.keyRings.getIamPolicy cloudkms.cryptoKeys.getIamPolicy cloudkms.cryptoKeys.list cloudkms.cryptoKeyVersions.list
Create key	cloudkms.cryptoKeys.create
Upload key	cloudkms.cryptoKeys.create cloudkms.importJobs.create cloudkms.importJobs.setIamPolicy cloudkms.importJobs.get cloudkms.importJobs.useToImport cloudkms.cryptoKeyVersions.create cloudkms.cryptoKeys.update
Add key version/Rotate native	cloudkms.cryptoKeyVersions.create cloudkms.cryptoKeys.update
Add key version/ Rotate BYOK	cloudkms.importJobs.create cloudkms.importJobs.setIamPolicy cloudkms.importJobs.get cloudkms.importJobs.useToImport cloudkms.cryptoKeyVersions.create cloudkms.cryptoKeys.update
Update key	cloudkms.cryptoKeys.update
Update key version	cloudkms.cryptoKeys.update cloudkms.cryptoKeyVersions.update
Update key policy	cloudkms.cryptoKeys.getIamPolicy cloudkms.cryptoKeys.setIamPolicy cloudkms.cryptoKeys.update
Schedule delete key material	cloudkms.cryptoKeyVersions.destroy
Cancel schedule delete key material	cloudkms.cryptoKeyVersions.restore
Get the public key of an asymmetric key	cloudkms.cryptoKeyVersions.viewPublicKey

Add Google Connection on CipherTrust Manager

Before you can add a Google Cloud key ring to the CCKM, a connection to your Google Cloud service account must already exist on the CipherTrust Manager. A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connection Manager](#) for details.

When configuring the connection, the CipherTrust Manager Administrator requires a key file (a JSON file). This file can be generated on your Google Cloud Console. Refer to the Google Cloud documentation for details.

Warning

Thales strongly discourages creating a Google connection using a service account key file that grants permission to [root of trust keys](#).

After the connection is configured, you can view the linked Google Cloud projects and manage the key rings in those projects. You can manage Google Cloud key rings and keys on the CipherTrust Manager.

Refer to the following sections:

- [Google Cloud Projects](#)
- [Google Cloud Key Rings](#)
- [Google Cloud Keys](#)
- [Google Cloud Reports](#)
- [Scheduling Operations](#)
- [Downloading Google Metadata](#)

Google Cloud Projects

This section describes how to manage Google Cloud projects on CCKM. Before proceeding, make sure that a connection to a Google Cloud service account is configured on the CipherTrust Manager.

After you have configured a connection, Google Cloud projects can be added, modified, or deleted on the Projects tab of the Google page.

Adding a Google Cloud Project

To add a Google Cloud project on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Google page contains two tabs: Key Rings and Projects.

3. Click the **Projects** tab.
4. Click **Add Existing Project**. The **Add Existing Google Project** screen displays.
5. Under **Select Method**, select **Select From List**. This option allows you to select an existing project from a list of connections stored in CipherTrust Connection Manager.

The **Manually Enter Project ID** option allows you manually enter a project ID to connect to a project without credentials. This option is only applicable if you are integrating the Google Cloud External Key Manager (EKM) service with CCKM to create and manage endpoints in CCKM for Google Cloud EKM service to access Key Encryption Keys (KEKs).

6. Select the desired connection from the **Connection** drop-down list. The linked Google Cloud projects are auto-populated in the **Project ID** drop-down list.
7. Select the desired project ID from the **Project ID** drop-down list.
8. (Optional) Use the **Enable success audit events** toggle to enable or disable audit recording of successful operations within the given Google cloud project. This toggle is set to enable, by default.
9. Click **Add Project**.

A success message is displayed on the screen and the selected project ID is displayed on the **Projects** tab.

Viewing Google Projects

The Projects tab shows the list of existing Google projects. Search for projects by Name or Connection.

To view the list of Google projects available on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Google page displays the Google Cloud projects and key rings added to CCKM, not all available on Google Cloud.
3. Click the **Projects** tab. The list of projects added to CCKM is displayed. The tab displays the following details:

Field	Description
Project ID	ID of the project.
Name	Name of the project.
Connection	Name of the Google Cloud connection with the CipherTrust Manager.
Organization	Organization of the project.
Date Added	Time when the project was added to CCKM.

To view the custom columns, click the Customize View () icon, select the desired option, and click **OK** to display

the column.

Viewing Details of a Google Cloud Project

To view the details of a Google Cloud project on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**.
3. Click the **Projects** tab. The list of projects added to CCKM is displayed.
4. On the Projects tab, click the **Name** link of the desired project.

Alternatively, click the overflow icon () corresponding to the desired project, and click **View/Edit**.

The edit view of the Google Projects page shows additional details of the selected project under the ACCESS CONTROL and GENERAL INFO sections.

Update General Information for a Google Project

From the details page of a Google project, the **Connection** name, which is uneditable, is displayed along with the **Enable success audit events** toggle. This toggle allows you change the setting for the audit recording of successful EKM operations within a Google project by enabling or disabling this feature.

To update the Google project

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**.
3. Click the **Projects** tab. The list of projects added to CCKM is displayed.
4. On the Projects tab, click the **Name** link of the desired project.

Alternatively, click the overflow icon () corresponding to the desired project, and click **View/Edit**.

The edit view of the Google Projects page shows additional details of the selected project under the ACCESS CONTROL and GENERAL INFO sections.

5. Under GENERAL INFO, use the **Enable success audit events** toggle to change the current setting.
6. Click **Update**.

Managing User Permissions on Google Cloud Projects

To work with the Google Cloud, users/group must have the minimum set of permissions that allow them to use the Google Cloud resources, such as keys and Google Cloud projects. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are a member of the CCKM Users group will be granted permissions to perform operations on Google Cloud projects.

Adding Permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**.
3. Click the **Projects** tab.
4. On the Projects tab, click the **Name** link of the desired project.

Alternatively, click the overflow icon () corresponding to the desired project, and click **View/Edit**.

5. In the ACCESS CONTROL section, click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
6. Select the desired user or group from the **User/Group** drop-down list.
7. Click **Save**.

The newly added user/group is displayed under **Name** in the ACCESS CONTROL section. You can now grant additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Allowed Operations

CCKM allows the following operations on Google Cloud projects for CryptoSpace(s): View, Create, Edit, Delete, Block, Unblock, and Unassign.

CCKM allows the following operations on Google Cloud projects for CryptoSpace Endpoints: View, Enable, Disable, and Unassign.

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the ACCESS CONTROL section, click **CryptoSpace(s)** or **CryptoSpace Endpoints** tab.
2. Select the check box under the desired operation corresponding to the desired users or groups.
3. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a Permission

To remove a permission assigned to a user or group:

1. In the ACCESS CONTROL section, click **CryptoSpace(s)** or **CryptoSpace Endpoints** tab.
2. Clear the check box under the desired operation corresponding to the desired users or groups.
3. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the ACCESS CONTROL section, click **CryptoSpace(s)** or **CryptoSpace Endpoints** tab.
2. Under **Unassign**, click the **X** button corresponding to the desired user/group.
3. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

4. Click **Remove** to confirm the action. To cancel the change, click **Cancel**.

A success message is displayed on the screen.

Removing a Google Cloud Project

Google Cloud projects can be removed from the Projects tab of the Google page. Search for the Google Cloud projects using Name or Connection.

To remove a Google Cloud project from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**.
3. Click the **Projects** tab. The list of projects added to CCKM is displayed.
4. Click the overflow icon () corresponding to the project you want to remove.

Warning

The removed project's keys will no longer be available on the Google Keys page, but the keys will still exist on the Google Cloud. If you later add this project with the same ID, the keys will be available again.

5. Select **I wish to delete this project**.

6. Click **Delete Project**.

A message **Project deleted successfully** is displayed on the screen.

Google Cloud Key Rings

This section describes how to manage Google Cloud key rings on CCKM. Before proceeding, a connection to your Google Cloud account must exist on the CipherTrust Manager. Refer to [Connection Manager](#) for details.

After the connection is configured, you can add key rings linked with a project on the CipherTrust Manager. Google Cloud key rings can be added, viewed, modified, or deleted on the Key Rings tab of the Google page.

Adding an Existing Google Cloud Key Ring

Adding an existing Google Cloud key ring to CCKM requires selecting a Google Cloud project and location of existing key rings. Based on these, the list of relevant key rings is retrieved from the Google Cloud project.

To add an existing Google Cloud key ring to CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Google page contains two tabs: Key Rings and Projects. Key Rings is the default tab.
3. Click **Add Existing Key Ring**. The Select Connection Information screen is displayed.
4. Select the Google **Connection**. The linked Google Cloud projects are auto-populated in the **Project ID** drop-down list.
5. Select the **Project ID** where the Google Cloud key ring resides. The project locations are auto-populated in the **Location** drop-down list.
6. Select the key ring **Location**.
7. Click **Next**. The Add Key Rings screen is displayed. The screen shows the available key rings based on the Connection, Project ID, and Location you selected on the previous screen. Only the key rings not already added to CCKM are displayed.
8. Select the desired key rings.

Tip

To select multiple key rings, select the check boxes corresponding to them.
To select all the retrieved key rings, select the check box to the left of the Selected label (over the **Name** heading).

- Click **Save**.

The selected key rings are displayed on the Key Rings tab.

Viewing Key Rings

The Key Rings tab of the Google page shows the list of key rings available in the projects added to the CipherTrust Manager. Search for the key rings by Name or Connection.

To view the list of key rings available on CCKM:

- Open the **Cloud Key Manager** application.
- In the left pane, click **KMS Containers > Google**. The Google page displays the Google Cloud projects and key rings added to CCKM, not all available on Google Cloud.

The Key Rings tab shows the list of key rings added to CCKM is displayed. The tab displays the following details:

Field	Description
Name	Name of the key ring.
Location	Location of the project linked with the key ring.
Project ID	ID of the linked project.
Organization	Organization of the key ring.
Connection	Name of the Google Cloud connection with the CipherTrust Manager.
Last Refreshed	Time when the key ring was refreshed the last.
Created	Time when the key ring was created.

To view the custom columns, click the Customize View (⚙️) icon, select the desired option, and click **OK** to display the column.

Refreshing Key Rings

Refreshing is the process to download keys created in Google Cloud key rings to the CCKM. You can refresh

keys from individual or all Google Cloud key rings.

- [Refreshing Specific Key Rings](#)
- [Refreshing All Key Rings](#)

Refreshing Specific Key Rings

To refresh a key ring:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Google page is displayed. The Key Rings tab displays the key rings added to CCKM.
3. Click the overflow icon () corresponding to the desired key ring and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Google > Google Keys** page. Refer to [Viewing Google Cloud Keys](#) for details.

Refreshing All Key Rings

To refresh all key rings:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Google page is displayed. The Key Rings tab displays the key rings added to CCKM.
3. On the Key Rings tab, click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all key rings is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Google > Google Keys** page. Refer to [Viewing Google Cloud Keys](#) for details.

Viewing Details of a Key Ring

To view the details of a key ring on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**.
3. On the Key Rings tab, click the **Name** link of the desired key ring.

Alternatively, click the overflow icon () corresponding to the desired key ring, and click **View/Edit Details**.

The edit view of the Google Key Rings page shows additional details of the selected key ring including the configured ACCESS CONTROL.

Managing User Permissions on Google Cloud Key Rings

To work with the Google Cloud, users/group must have the minimum set of permissions that allow them to use the Google Cloud resources such as keys and Google Cloud key rings. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on Google Cloud key rings.

Adding Permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**.
3. On the Key Rings tab, click the **Name** link of the desired key ring.

Alternatively, click the overflow icon () corresponding to the desired key ring, and click **View/Edit Details**.

4. In the ACCESS CONTROL section, click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
5. Select the desired user or group from the **User/Group** drop-down list.
6. Click **Save**.

The newly added user/group is displayed under **Name** in the ACCESS CONTROL section. You can now grant additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Allowed Operations

CCKM allows the following operations on Google Cloud key rings:

-
- View Keys, Add Key, Edit / Disable/ Enable, Synchronize, Upload
 - Schedule Destroy, Cancel Destroy

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the ACCESS CONTROL section, select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a Permission

To remove a permission assigned to a user or group:

1. In the ACCESS CONTROL section, clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the ACCESS CONTROL section, under **Unassign**, click the **X** button corresponding to the desired user/group.
2. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

3. Click **Remove** to confirm the action. To cancel the change, click **Keep It**.

A success message is displayed on the screen.

Removing a Google Cloud Key Ring

Google Cloud key rings can be removed from the Key Rings tab of the Google page. Search for existing key rings using Name or Connection.

Note

When a Google Cloud key ring is removed from CCKM, it is also deleted from Google Cloud.

To remove a key ring from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Google page is displayed. The list of key rings added to CCKM is displayed.
3. Click the overflow icon () corresponding to the key ring you want to remove.
4. Click **Delete**.

Google Cloud Keys

This section describes how to manage Google Cloud keys on CCKM. Before proceeding, you must have a Google Cloud key ring added to the CCKM. Refer to [Google Cloud Key Rings](#) for details.

Key Types

CCKM supports two types of Google Cloud keys:

- **Symmetric:** A randomly generated key is used to encrypt and decrypt the data.
- **Asymmetric:** A public and private RSA key pair is used to encrypt and decrypt the data. The public key encrypts while the private key decrypts the data.

Key Creation Methods and Sources

Methods to create Google Cloud keys using CCKM are:

- **Creating/Uploading New Key Material:** Add key material by creating and uploading new source key or creating new native key. The key source can be:
 - **CipherTrust (External):** A new key is first created on the external CipherTrust Manager. Then, this key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the external CipherTrust Manager, the key origin is **CipherTrust (External)**.
 - **CipherTrust (Local):** A new key is first created on the CipherTrust Manager. Then, this key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **Google (Native):** A new key is directly created on Google Cloud using the native Google application. The key origin is **NATIVE**.
 - **Luna HSM:** A new Luna HSM key is first created on the CipherTrust Manager. Then, this key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- **Vormetric DSM:** A new DSM key is first created on the CipherTrust Manager. Then, this key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
- **Cloning Existing Key Material:** Clone key material from an existing key to create a new key. The key source can be:
 - **CipherTrust (Local):** An existing local CipherTrust Manager key is first cloned on the CipherTrust Manager. Then, the cloned key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **CipherTrust (External):** An existing key is first cloned on the external CipherTrust Manager. Then, this key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the external CipherTrust Manager, the key origin is **CipherTrust (External)**.
 - **Luna HSM:** An existing Luna HSM key is first cloned on the CipherTrust Manager. Then, the key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- **Vormetric DSM:** An existing DSM key is first cloned on the CipherTrust Manager. Then, the key material is uploaded to Google Cloud to create a new Google Cloud key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.

Creating/Uploading New Key Material

To add a Google Cloud key by creating/uploading new key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click **Add Key**. The Select Material Origin screen of the Add Google Key wizard is displayed.

-
- Under **Select Method**, select **Create/Upload New Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following:

- **CipherTrust (External)**: Refer to [Uploading CipherTrust \(External\) Key Material](#) for details.
- **CipherTrust (Local)**: Refer to [Uploading CipherTrust \(Local\) Key Material](#) for details.
- **Google (Native)**: Refer to [Creating Google \(Native\) Key Material](#) for details.
- **Luna HSM**: Refer to [Uploading Luna HSM Key Material](#) for details.
- **Vormetric DSM**: Refer to [Uploading Vormetric DSM Key Material](#) for details.

Refer to [Key Creation Methods and Sources](#) for details on key sources.

Uploading CipherTrust (External) Key Material

Upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

- Select **CipherTrust (External)**.
- Click **Next**. The Configure CipherTrust (External) Key screen is displayed.

Configure CipherTrust (External) Key

- Select Key Type**. The options are **Symmetric** and **Asymmetric**.
 - **Symmetric**: Creates and uploads a symmetric key.
 - **Asymmetric**: Creates and uploads an asymmetric key. Additional fields **Algorithm** and **Key Size** are displayed.
- Select Domain** from the drop-down list. The drop-down list shows the external CM domains linked with the configured external CM connection.
- Enter a **Key Name**. A new key with this name will be created on the CipherTrust Manager and its key material will be uploaded to Google Cloud.
- (Applicable to **Asymmetric** keys) Select an **Algorithm** for the key.
- (Applicable to **Asymmetric** keys) Select a **Key Size / Key Curve** for the key. The options vary based on the selected **Algorithm**.

- Click **Next**.

Configure Destination (Google) Key

- (Applicable to **Asymmetric** keys) Select the **Key Purpose**. A key purpose specifies the operation that the key

can be used to perform. Depending on the key algorithm selected on the previous screen, the options are:

- **Decrypt:** Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign:** Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.
 3. Select the desired **Key Ring** from the drop-down list.
 4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them. That is, the **Google Automatic Rotation** check box will be disabled for them.
 5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.
 - b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional, applicable to **Symmetric** keys) Select **Google Automatic Rotation** and specify the following:
 - a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.
 - b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will

happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:
 - **Software:** Crypto operations are performed in software.
 - **HSM:** Crypto operations are performed in an HSM.
8. (Applicable to **Asymmetric** keys) Select an **Algorithm** for the key. The options vary based on the **Algorithm**, **Key Size / Key Curve** (selected on the Configure Source Key screen), and key purpose.
9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
- c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.
 2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local):** The local CipherTrust Manager.
 - **CipherTrust (External):** The external CipherTrust Manager.
 - **Luna:** HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM:** Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native:** Native cloud, Google.
-

-
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
 4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Uploading CipherTrust (Local) Key Material

Upload the local key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Configure CipherTrust (Local) Key screen is displayed.

Configure CipherTrust (Local) Key

1. **Select Key Type**. The options are **Symmetric** and **Asymmetric**.
 - **Symmetric**: Creates and uploads a symmetric key.
 - **Asymmetric**: Creates and uploads an asymmetric key. Additional fields **Algorithm** and **Key Size** are displayed.
2. Enter a **Key Name**. A new key with this name will be created on the CipherTrust Manager and its key material will be uploaded to Google Cloud.

3. (Applicable to **Asymmetric** keys) Select the **Algorithm**. The options are **RSA** and **EC**.
4. (Applicable to **Asymmetric** keys) Select the **Key Size / Key Curve** based on the algorithm:
 - For the **RSA** algorithm, select the **Key Size**. The options are 2048, 3072, and 4096.
 - For the **EC** algorithm, select the **Key Curve**. The options are prime256v1, secp384r1, and secp256k1.
5. Click **Next**.

Configure Destination (Google) Key

1. (Applicable to **Asymmetric** keys) Select the **Key Purpose**. A key purpose specifies the operation that the key can be used to perform. Depending on the key algorithm selected on the previous screen, the options are:
 - **Decrypt**: Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign**: Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.

3. Select the desired **Key Ring** from the drop-down list.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them. That is, the **Google Automatic Rotation** check box will be disabled for them.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.
 - b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional, applicable to **Symmetric** keys) Select **Google Automatic Rotation** and specify the following:

- a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.

- b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:

- **Software:** Crypto operations are performed in software.
- **HSM:** Crypto operations are performed in an HSM.

8. (Applicable to **Asymmetric** keys) Select an **Algorithm** for the key. The options vary based on the **Algorithm**, **Key Size / Key Curve** (selected on the Configure Source Key screen), and key purpose.

9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
- c. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply.** The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local):** The local CipherTrust Manager.
 - **CipherTrust (External):** The external CipherTrust Manager.
 - **Luna:** HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM:** Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native:** Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Creating Google (Native) Key Material

Create the key material directly using native Google application.

Select Material Origin > Select Source

1. Select **Google (Native)**.

2. Click **Next**. The Configure Source Key screen is displayed.

Configure Source Key

1. **Select Key Type**. The options are:
 - **Symmetric**: Creates a symmetric key. Additional field **Google Automatic Rotation** is displayed.
 - **Asymmetric**: Creates an asymmetric key. Additional fields **Select Key Purpose** and **Algorithm** are displayed.
2. (Applicable to **Asymmetric** keys) **Select Key Purpose**. A key purpose specifies the operation that the key can be used to perform. The options are:
 - **Decrypt**: Enables the key for RSA encryption.
 - **Sign**: Enables the key for elliptic curve signing and RSA signing.
3. Enter the **Key Name**. This name helps uniquely identify a key.
4. Select the desired **Key Ring** from the drop-down list.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.
 - b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional, applicable to **Symmetric** keys) Select **Google Automatic Rotation** and specify the following:
 - a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.

-
- b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:
 - **Software:** Crypto operations are performed in software.
 - **HSM:** Crypto operations are performed in an HSM.
8. (Applicable to **Asymmetric** keys) Select an **Algorithm** for the key. The options vary based on the selected key purpose.
9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
- c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply.** The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local):** The local CipherTrust Manager.
 - **CipherTrust (External):** The external CipherTrust Manager.
 - **Luna:** HSM Luna. Also select a partition from the **Select Partition** drop-down list.

- **DSM:** Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
- **Native:** Native cloud, Google.

3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.

4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, NATIVE KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **NATIVE KEY** and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the NATIVE KEY and KEY SCHEDULES sections becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys. The origin of the key is **NATIVE**.

Uploading Luna HSM Key Material

Upload the key material using Luna HSM to configure the source key.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Select Material Origin > Select Source

1. Select **Luna HSM**.
2. Click **Next**. The Configure Source Key screen is displayed.

Configure Source Key

1. Enter a **Luna HSM Key Label**. A new key with this name will be created on the Luna HSM and its key material will be uploaded to Google Cloud.
2. Select the **Partition ID** of the desired Luna HSM partition.
3. Select the key **Mechanism**. The supported key mechanisms are:
 - CKM_RSA_FIPS_186_3_AUX_PRIME_KEY_PAIR_GEN
 - CKM_RSA_X9_31_KEY_PAIR_GEN
 - CKM_RSA_FIPS_186_3_PRIME_KEY_PAIR_GEN
 - CKM_RSA_PKCS_KEY_PAIR_GEN
4. Select the **Key Size** from the available options. The supported sizes are 2048, 3072, and 4096.
5. Select the **Key Attributes**. The options are:
 - Modifiable, Extractable, Sensitive (all *three* are selected for a **BYOK Compatible** key)
 - Encrypt, Decrypt, Wrap, Unwrap
 - Sign, Verify, Derive
6. Click **Next**.

Configure Destination (Google) Key

1. **Select Key Purpose**. A key purpose specifies the operation that the key can be used to perform. The options are:
 - **Decrypt**: Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign**: Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the Luna HSM Key Label you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.
3. Select the desired **Key Ring** from the drop-down list.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.

- a. Select **Soft Delete Wait Time**.
- b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. Select the **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:
 - **Software**: Crypto operations are performed in software.
 - **HSM**: Crypto operations are performed in an HSM.
7. Select an **Algorithm** for the key. The options vary based on the key size and the purpose.
8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
- c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.

2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local)**: The local CipherTrust Manager.
 - **CipherTrust (External)**: The external CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native**: Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Uploading Vormetric DSM Key Material

Upload the key material using Vormetric DSM to configure the source key.

Select Material Origin > Select Source

1. Select **Vormetric DSM**.
2. Click **Next**. The Configure Source Key screen is displayed.

Configure Source Key

1. **Select Encryption Type.** The options are **Symmetric** and **Asymmetric**.
 - **Symmetric:** Creates and uploads a symmetric key.
 - **Asymmetric:** Creates and uploads an asymmetric key. Additional fields **Algorithm** and **Key Size** are displayed.
2. Enter a **DSM Key Name**. A new key with this name will be created on the DSM and its key material will be uploaded to Google Cloud.
3. (Optional) Provide a **Description** for the key.
4. Select a **DSM Domain** for the key. The drop-down list shows the DSM domains linked with the configured DSM connection.
5. (Optional) Select the **Expiration Date** check box, select the key expiration date and time from the on-screen calendar.
6. (Applicable to **Asymmetric** keys) Select an **Algorithm** for the key. The options are RSA-2048, RSA-3072, and RSA-4096.
7. Click **Next**.

Configure Destination (Google) Key

1. (Applicable to **Asymmetric** keys) **Select Key Purpose.** A key purpose specifies the operation that the key can be used to perform. The options are:
 - **Decrypt:** Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign:** Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the DSM Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.
3. Select the desired **Key Ring** from the drop-down list.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them. That is, the **Google Automatic Rotation** check box will be disabled for them.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.

- b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional, applicable to **Symmetric** keys) Select **Google Automatic Rotation** and specify the following:
 - a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.

- b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:
 - **Software**: Crypto operations are performed in software.
 - **HSM**: Crypto operations are performed in an HSM.
8. (Applicable to **Asymmetric** keys) Select an **Algorithm** for the key. The options vary based on the key purpose.
9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
- c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local)**: The local CipherTrust Manager.
 - **CipherTrust (External)**: The external CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native**: Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as

appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Cloning Existing Key Material

To add a new Google Cloud key by cloning key material existing on the CipherTrust Manager, Luna HSM, or the DSM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click **Add Key**. The Select Material Origin screen of the Add Google Key wizard is displayed.
4. Under **Select Method**, select **Clone Existing Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following:
 - **CipherTrust (External)**: Refer to [Cloning CipherTrust \(External\) Key Material](#) for details.
 - **CipherTrust (Local)**: Refer to [Cloning CipherTrust \(Local\) Key Material](#) for details.
 - **Luna HSM**: Refer to [Cloning Luna HSM Key Material](#) for details.
 - **Vormetric DSM**: Refer to [Cloning Vormetric DSM Key Material](#) for details.

Refer to [Key Creation Methods and Sources](#) for details on these key sources.

Cloning CipherTrust (External) Key Material

Clone and upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (External)**.
2. Click **Next**. The Select CipherTrust (External) Key screen is displayed.

Select CipherTrust (External) Key

1. **Select Domain** from the drop-down list. The drop-down list shows the external CM domains linked with the configured external CM connection.
2. Select an **Algorithm**. The options are **AES**, **RSA**, and **EC**.
3. Select the **Key Size** based on the key type:
 - For an **AES** key, the option is 256.
 - For an **RSA** key, the options are 2048, 3072, and 4096.
 - For an **EC** key, the options are prime256v1, secp384r1, and secp256k1.
4. Select the desired **CipherTrust (External) Key** from the list.
5. Click **Next**. The Configure Destination (Google) Key screen is displayed.

Configure Destination (Google) Key

1. (Applicable to **Asymmetric** keys) **Select Key Purpose**. A key purpose specifies the operation that the key can be used to perform. The options are:
 - **Decrypt**: Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign**: Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the CipherTrust Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.

3. Select the desired **Key Ring**. The drop-down list shows the key rings in the project location linked with the configured Google Cloud connection.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them. That is, the **Google Automatic Rotation** check box will be disabled for them.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.
 - b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional) Select **Google Automatic Rotation** and specify the following:

- a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.

- b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:

- **Software**: Crypto operations are performed in software.
- **HSM**: Crypto operations are performed in an HSM.

8. Select the **Algorithm** for the key.

9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

-
- a. Specify a tag name.
 - b. Specify the tag value.
 - c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local)**: The local CipherTrust Manager.
 - **CipherTrust (External)**: The external CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native**: Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID link is displayed, the key is created successfully.

-
3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Cloning CipherTrust (Local) Key Material

Clone and upload the local key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Select CipherTrust (Local) Key screen is displayed.

Select CipherTrust (Local) Key

1. Select an **Algorithm**. The options are **AES**, **RSA**, and **EC**.
2. Select the **Key Size** based on the key type:
 - For an **AES** key, the option is 256.
 - For an **RSA** key, the options are 2048, 3072, and 4096.
 - For an **EC** key, the options are prime256v1, secp384r1, and secp256k1.
3. Select the desired **CipherTrust (Local) Key** from the list.
4. Click **Next**. The Configure Destination (Google) Key screen is displayed.

Configure Destination (Google) Key

1. (Applicable to **Asymmetric** keys) **Select Key Purpose**. A key purpose specifies the operation that the key can be used to perform. The options are:
 - **Decrypt**: Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign**: Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the CipherTrust Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.

3. Select the desired **Key Ring**. The drop-down list shows the key rings in the project location linked with the configured Google Cloud connection.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them. That is, the **Google Automatic Rotation** check box will be disabled for them.

5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.

- a. Select **Soft Delete Wait Time**.
- b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional) Select **Google Automatic Rotation** and specify the following:

- a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.

- b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:

- **Software**: Crypto operations are performed in software.
- **HSM**: Crypto operations are performed in an HSM.

8. Select the **Algorithm** for the key.

9. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

- a. Specify a tag name.
- b. Specify the tag value.
- c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

10. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local)**: The local CipherTrust Manager.
 - **CipherTrust (External)**: The external CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native**: Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as

appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Cloning Luna HSM Key Material

Clone and upload the Luna HSM key material using the CipherTrust Manager to configure the source key.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Select Material Origin > Select Source

1. Select **Luna DSM**.
2. Click **Next**. The Select Luna HSM Key screen is displayed.

Select Luna HSM Key

1. Select the **Key Size**. The options are 2048, 3072, and 4096.
2. Select the desired **HSM Key** from the list.
3. Click **Next**. The Configure Destination (Google) Key screen is displayed.

Configure Destination (Google) Key

1. **Select Key Purpose**. A key purpose specifies the operation that the key can be used to perform. The options are:
 - **Decrypt**: Enables the key for RSA encryption. This option is not applicable to EC algorithms.
 - **Sign**: Enables the key for elliptic curve signing and RSA signing.
2. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the DSM Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.

3. Select the desired **Key Ring**. The drop-down list shows the key rings in the project location linked with the configured Google Cloud connection.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.
 - b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys, the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. Select the **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:
 - **Software**: Crypto operations are performed in software.
 - **HSM**: Crypto operations are performed in an HSM.
7. Select the **Algorithm** for the key. The options vary based on the key purpose.
8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

-
- a. Specify a tag name.
 - b. Specify the tag value.
 - c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local)**: The local CipherTrust Manager.
 - **CipherTrust (External)**: The external CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native**: Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID link is displayed, the key is created successfully.

-
3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Cloning Vormetric DSM Key Material

Clone and upload the DSM key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **Vormetric DSM**.
2. Click **Next**. The Select DSM Key screen is displayed.

Select DSM Key

1. Select an **Algorithm**. The options are **AES** and **RSA**.
2. Select the **Key Size** based on the key type:
 - For an **AES** key, the option is 256.
 - For an **RSA** key, the options are 2048, 3072, and 4096.
3. Select the desired **DSM Key** from the list.
4. Click **Next**. The Configure Destination (Google) Key screen is displayed.

Configure Destination (Google) Key

1. Enter a user-friendly alias as the **Key Name**. This will be the key name on Google Cloud. This name helps uniquely identify a Google Cloud key. By default, the DSM Key Name you specified on the previous screen is populated.

The key name can only contain alphanumeric characters and dashes.

2. (Optional) Provide a basic **Description** of the key.
3. Select the desired **Key Ring**. The drop-down list shows the key rings in the project location linked with the configured Google Cloud connection.
4. (Optional) Select **Restrict key versions to import only** to specify that the newer versions of the key can only be imported. After key creation, this field will become non-editable. Google native key rotation will not be allowed for them. That is, the **Google Automatic Rotation** check box will be disabled for them.
5. (Optional) Configure the duration for which the key can remain in the soft-deleted state before it is destroyed from CCKM. The default duration is 30 days.
 - a. Select **Soft Delete Wait Time**.
 - b. Specify **Soft Delete Wait Time (Days)**. The duration can range from 1 to 120 days. For import-only keys,

the minimum duration is 0 days.

Note

- The duration applies to all versions of the key created in the future.
- The soft-delete wait time can't be modified after the key is created.
- The soft-deleted key will be removed from CCKM after the number of days specified in **Soft Delete Wait Time (Days)**.

6. (Optional) Select **Google Automatic Rotation** and specify the following:

- a. Select **Rotation Period** from the drop-down list. This is the time period (in days) after which the key will rotate automatically, after the date specified in **Starting on** (see below). The options are 30, 90, 180, and 365 days.

To specify a custom frequency, select **Custom** and specify the rotation frequency in the **Rotate key every (days)** field that appears. The default value is **1** day.

- b. Click the **Starting on** field, and select the key expiration date and time from the on-screen calendar.

This is the time when the automatic key rotation becomes effective. Next automatic key rotation will happen after the specified **Rotation Period**.

For example, if you set **Rotation Period** as 30 days and set **Starting on** as today, the key will automatically rotate after 30 days from today.

7. Select a **Protection Level** for the key. A protection level specifies how cryptographic operations are performed. The options are:

- **Software**: Crypto operations are performed in software.
- **HSM**: Crypto operations are performed in an HSM.

8. (Optional) Enter **Tags**. A tag is a label assigned to the key that consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add a tag:

-
- a. Specify a tag name.
 - b. Specify the tag value.
 - c. Click the + button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

9. Click **Next**. The Add to Schedule screen is displayed.

Add to Schedule

1. **Select Schedule to Apply**. The drop-down list shows the available key rotation schedules.
2. Select the **Key Origin** from the available options. The key origin can be:
 - **CipherTrust (Local)**: The local CipherTrust Manager.
 - **CipherTrust (External)**: The external CipherTrust Manager.
 - **Luna**: HSM Luna. Also select a partition from the **Select Partition** drop-down list.
 - **DSM**: Vormetric Data Security Manager. Also select a domain from the **Select Domain** drop-down list.
 - **Native**: Native cloud, Google.
3. Select an **Algorithm**. For the **Native** Key Origin, the Algorithm field is unavailable.
4. Click **Next**.

The Review and Add Key screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, DESTINATION KEY, and KEY SCHEDULES sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY**, **DESTINATION KEY**, and **KEY SCHEDULES** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY and KEY SCHEDULES sections becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Google Key wizard is closed.

The newly created key is displayed in the list of Google Cloud keys.

Viewing Google Cloud Keys

The Google Keys page shows the list of Google Cloud keys available on the CipherTrust Manager.

To view the Google Cloud keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**. The list of available Google Cloud keys is displayed. The Google Keys page displays the following details:

Field	Description
Name	Unique, user-friendly name of the Google Cloud key. Click the link to view additional details of the key or edit the key. Refer to Viewing or Editing Details of Google Cloud Keys . This name is useful in searching for specific keys.
Status	State of the Google Cloud key. The status can be: • Available • Not Available • Deleted
Purpose	Purpose of the Google Cloud key. The purpose can be: •Encrypt Decrypt •Asymmetric Sign •Asymmetric Decrypt
Protection	Protection level of the Google Cloud key. The protection level can be Software or HSM.
Algorithm	Algorithm of the Google Cloud key. A number of algorithms are supported.
Key Ring	Name of the Google Cloud key ring where the key resides.
Location	Location where the Google Cloud key is created.
Project	Project where the Google Cloud key is created.
Organization	Organization where the Google Cloud key is created.
Creation Date	Date and time when the Google Cloud key is created.

Field	Description
Next Google Rotation	Date and time of the next Google Cloud key rotation.

Sometimes, you might notice certain Google Cloud keys are displayed as grayed out. This happens when the keys are no longer accessible. For example, when:

- Any cloud permissions on the keys are changed. The keys are no longer accessible from the Google Cloud connection.
- Connection is changed in KMS. The new connection does not have permissions to access the keys.
- When Google Cloud locations are changed or removed. The keys from the configured location are no longer accessible.

Refreshing Google Cloud Keys

Refreshing is the process of downloading keys created in Google Cloud key rings to CCKM. You can refresh keys from all Google Cloud key rings at once.

Refreshing All Keys

To refresh all keys:

1. Open the Cloud Key Manager application.
2. In the left pane, click **Cloud Keys > Google**. The Google Keys page is displayed. This page displays the list of Google Cloud keys.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all keys is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message Refresh started... is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Google > Google Keys** page.

Refreshing Specific Keys

To refresh a key:

1. Open the Cloud Key Manager application.

2. In the left pane, click **Cloud Keys > Google**. The Google Keys page is displayed. This page displays the list of Google Cloud keys.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Refresh**.

A message Key refreshed successfully.

The refreshed key is listed on the **Cloud Keys > Google > Google Keys** page.

Viewing Versions of a Key

To view the versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key. The key version details are displayed:

Field	Description
Version	Version number of the key.
State	State of the key version. The state can be Aborted, Enabled, Disabled, Destroy Scheduled, or Destroyed.
Algorithm	Algorithm used for the key version.
Origin	Source of the key material used for the version. The origin can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud. Refer to Key Creation Methods and Sources for details.
Creation Date	Date and time when the key version is created.
Destroy Date	Date and time when the key version is destroyed.
Version Resource URL	URL of the key version resource on the CipherTrust Manager.

Disabling a Key Version

If required, you can disable an enabled version of a key. An aborted, destroy scheduled, or destroyed key version cannot be disabled.

A disabled version cannot operate on data. After the key version is disabled, there is a delay of up to a few hours during which it can still operate on data. You can again [enable](#) the version later. All versions of a key can also be disabled at once. Refer to [Disabling All Versions of a Key](#).

To disable a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired version.
5. Click **Disable Version**. The Disable Key Version dialog box is displayed.
6. Click **Yes, Disable** to confirm the action.

The state of the key version changes to Disabled.

Enabling a Key Version

If required, you can enable a disabled version of a key. An aborted, destroy scheduled, or destroyed key version cannot be enabled.

To enable a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired version.
5. Click **Enable Version**. The Enable Key Version dialog box is displayed.
6. Click **Yes, Enable** to confirm the action.

The state of the key version changes to Enabled.

Downloading Public Key of an Asymmetric Version

The public key of *asymmetric* versions of a Google Cloud key can be downloaded.

To download the public key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired *asymmetric* version.
5. Click **Get Public Key**.

The public key of (`public-key.pem`) the asymmetric key version is downloaded to your machine.

Scheduling Destruction of a Key Version

With CCKM, you can schedule destruction of a Google Cloud key version. The version will be destroyed from GCP after the configured soft-delete wait time. However, you can [cancel the schedule destruction](#) before the scheduled destruction time.

Caution

When a key version is destroyed from GCP, the version is immediately disabled. Any data encrypted or signed by the version cannot be decrypted or verified. However, the destroyed key can be recovered using the `post /v1/cckm/google/keys/{id}/versions/{versionID}/re-import` API. Refer to [Re-importing a Google Cloud Key Version](#) for details.

To schedule destruction of a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired version.
5. Click **Schedule Destruction**. The Schedule Key Version Destruction dialog box is displayed.

Note

If you confirm scheduled destruction, the version will be destroyed from GCP after the configured soft-delete wait time.

6. Click **Yes, Schedule Destruction** to confirm the action.

The state of the key version changes to **Destroy Scheduled**. After the configured soft-delete wait time, the state will become **Destroyed**.

Canceling Scheduled Destruction of a Key Version

A scheduled destruction of a key version can be canceled before the destruction time arrives (that is, within the configured soft-delete wait time, after you scheduled destruction).

To cancel the schedule destruction of a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired version with the **Destroy Scheduled** state.
5. Click **Cancel Destruction**. The Cancel Key Version Destruction dialog box is displayed.
6. Click **Yes, Cancel Destruction** to confirm the action.

The state of the key version changes to Disabled. The disabled key version can be enabled, if required. Refer to [Enabling a Key Version](#).

Enabling All Versions of a Key

With CCKM, you can enable all disabled versions of a key at once. Aborted, destroy scheduled, or destroyed key versions cannot be enabled.

To enable all disabled versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Enable All Key Versions**. The Enable All Versions dialog box is displayed.
5. Click **Yes, Enable**.

All the key versions disabled earlier are now enabled. The status of the key versions changes to Enabled.

Disabling All Versions of a Key

With CCKM, you can disable all enabled versions of a key at once. Aborted, destroy scheduled, or destroyed key versions cannot be disabled.

A disabled version cannot operate on data. After the key version is disabled, there is a delay of up to a few hours during which it can still operate on data. You can again [enable](#) the version later. Individual versions of a key can also be disabled. Refer to [Disabling a Key Version](#).

To disable all enabled versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Disable All Key Versions**. The Disable All Versions dialog box is displayed.
5. Click **Yes, Disable**.

All the key versions enabled earlier are now disabled. The status of the key versions changes to Disabled.

Scheduling Destruction of All Versions of a Key

With CCKM, you can schedule destruction of all versions of key at once. The versions will be destroyed from GCP after the configured soft-delete wait time. However, you can [cancel the schedule destruction](#) before the scheduled destruction time.

Caution

When a key version is destroyed from GCP, the version is immediately disabled. Any data encrypted or signed by the version cannot be decrypted or verified. However, the destroyed key can be recovered using the `post /v1/cckm/google/keys/{id}/versions/{versionID}/re-import` API. Refer to [Re-importing a Google Cloud Key Version](#) for details.

To schedule destruction of all versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Destroy All Versions**. The Schedule Destruction dialog box is displayed.
5. Click **Yes, Schedule Destruction**.

All the key versions are scheduled for destruction. The status of the key versions changes to Destroy Scheduled.

Canceling Scheduled Destruction of All Key Versions

A scheduled destruction of all key versions can be canceled before the destruction time arrives (that is, within the configured soft-delete wait time, after you scheduled destruction).

To cancel the schedule destruction of all key versions:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.

3. Click the overflow icon () corresponding to the desired key.
4. Click **Cancel Destruction**. The Cancel Key Version Destruction dialog box is displayed.
5. Click **Yes, Cancel Destruction** to confirm the action.

The state of all enabled key versions changes to Disabled. The disabled key versions can be enabled, if required. Refer to [Enabling All Versions of a Key](#).

Adding a Key Version

CCKM provides two methods to add a new version to a key. Refer to [Key Creation Methods and Sources](#) for details on key creation methods and key sources.

To add a new key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Add Version**. The Add Version dialog box is displayed.
5. **Select Method**. The options are:
 - **Create/Upload New Key Material**: Refer to [Adding Key Version by Creating/Uploading Key Material](#).
 - **Clone Existing Key Material**: Refer to [Adding Key Version by Cloning Existing Key Material](#).

Adding Key Version by Creating New Key Material

1. Select **Create/Upload New Key Material** as the method.
2. **Select Source**. The options are:
 - **CipherTrust (Local)**: Select this option, select the **Algorithm**, and specify **Key Name** for the new key version.
 - **Google (Native)**: Select this option to create a new native Google Cloud key.
 - **Luna HSM**: Select this option, select the **Algorithm**, select the **Partition ID**, select **Key Attributes**, and specify **Key Name** for the new key version.

The key attributes Modifiable, Extractable, and Sensitive are selected for a **BYOK Compatible** key.

- **Vormetric DSM**: Select this option, select the **Algorithm**, select the **Domain**, and specify **Key Name** for the new key version.
3. Click **Add Version**.

A new version is added to the key.

Adding Key Version by Cloning Existing Key Material

1. Select **Clone Existing Key Material** as the method.
2. Select a **Source**. The options are:
 - **CipherTrust (External)**
 - **CipherTrust (Local)**
 - **Luna HSM**
 - **Vormetric DSM**
3. Select an **Algorithm**.
4. Select a **Key Size**.

Note

Depending on the algorithm of the existing key, the Algorithm and Key Size options for the new key version will vary.

5. Select a **Source Key** from the list.
6. Click **Save**.

A new version is added to the key.

Viewing or Editing Details of Google Cloud Keys

After a key is created, you can add or update tags and key rotation schedules, and also rotate key versions in the edit view. You can perform various operations on key versions.

In the edit view of a key, you can view all the key details such as its purpose, protection level, and location etc.

To view or edit an Google Cloud key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**. The list of available Google Cloud keys is displayed.
3. Click the overflow icon () corresponding to the desired key and click **View/Edit**. Alternatively, you can click the key name link. The edit view of the key is displayed. The edit view is divided into:
 - **LABELS:** View, add, and update labels. Refer to [Adding or Updating Labels](#).

- **ALGORITHM:** Update the default algorithm for the new key version. Refer to [Updating Default Algorithm for New Key Versions](#) for details.
- **ROTATION:** Update a key rotation schedule. Refer to [Updating Key Rotation Schedule](#) for details.
- **KEY VERSIONS:** Perform operations on key versions. Refer to [Performing Key Version Operations](#).
- **PERMISSIONS:** Manage the principles and roles. Refer to [Managing Principals and Roles](#).

Updating Default Algorithm for New Key Versions

To update the default algorithm for the new versions of the asymmetric key:

1. In the **ALGORITHM** section, select the desired algorithm from the **Select Default Algorithm for New Version** drop-down list.
2. Click **Update**.

The default algorithm is updated for the new versions of the key.

The key labels are updated.

Adding or Updating Labels

A label is a tag assigned to the key, which consists of a user-defined key and a value.

Note

For Google label requirements, refer to [Labeling keys | Cloud KMS Documentation | Google Cloud](#).

To add or update key labels, in the **LABELS** section:

1. Under **Label**, specify a tag key.
2. Enter the tag value.
3. Click the **+** button.

Similarly, you can add more tags. To remove a tag, click the close (X) icon in the tag name.

4. Click **Update**.

The key labels are updated.

Updating Key Rotation Schedule

To update a key rotation schedule, in the **ROTATION** section:

1. **Select Rotation Schedule.** The drop-down list shows the available key rotation schedules.

2. Select the **Key Origin**. The options are **CipherTrust (External)**, **CipherTrust (Local)**, **Native (Google)**, and **DSM**. Refer to [Key Creation Methods and Sources](#) for details on sources.
3. Select the **Algorithm** for the key.
4. (Applicable to the CipherTrust (External) and DSM) Select the desired **Domain**.
5. Click **Update**.

The key rotation schedule is updated.

Performing Key Version Operations

With CCKM, you enable/disable, add or rotate, and schedule destruction of key versions. Also, you can download public key of asymmetric versions of a key.

To perform a operation on a key version, under the Key Versions section:

1. Click the overflow icon () corresponding to the desired version. A popup menu appears.
2. Select the desired operation. Depending on the current state, the options can be Disable Version, Enable Version, and Schedule Destruction. An Aborted version cannot be enabled, disabled, or scheduled for destruction.

To download the public key of an asymmetric key version, click **Get Public Key**. The public key of (**public-key . pem**) the asymmetric key version is downloaded to your machine.

3. Confirm the operation.

Note

To rotate all versions of a key, click **Rotate** under the Key Versions section.

Managing Principals and Roles

Assigning Principals and Roles

To assign the principles and roles:

1. Expand **PERMISSIONS**.
2. Click **Assign Principal/Role**. The Assign Principal/Role wizard will open.
3. In the ADD PRINCIPAL section, select a principal **Type** from the drop-down list. The available types are **User**, **Service Account**, **Group**, and **Domain**.
4. **Add Principals**. You can add multiple principals separated by a comma.

To add additional principals, click **Add More Principals**.

5. In the SELECT ROLES section, select a **Role** from the drop-down list.
6. Click **Set Conditions**. The Add Conditions wizard is displayed.
 - a. Enter **Title**.
 - b. (Optional) Enter **Description**.
 - c. (Optional) Enter a **Condition** in **Basic View**.

Note

- Ensure the correctness of the logical expressions (conditions) you add. Neither CCKM nor GCP checks for the logical validity of the added conditions.
- Provide input in valid formats. CCKM performs input data validation similar to GCP.

- a. Select a **Condition Type**.
- b. Select an **Operator**.
- c. Select a **Detail** from the drop-down list for the selected Condition Type. This may be a resource type, resource service, value, or other detail.

To add additional conditions, select **Add Condition**.

To add a group condition, select **Add Group Condition**. A group condition contains more than one condition.

Note

- If you add multiple conditions and group conditions, you need to provide the relation between the conditions and relation between the conditions within the group condition. The relation can be **AND** or **OR**.
- You can also add conditions within the conditions and group conditions and group conditions within the conditions and group conditions.

- d. Click **Save**.

To add additional roles, click **Add More Roles**.

-
7. Click **Save**.

If the added principals already exist, the principal/role will be assigned and you will see a success message.

Editing Roles

To edit the roles:

1. Expand **PERMISSIONS**.
2. Expand the desired **Role**.
3. Under the expanded role, click the overflow icon () corresponding to the desired principal.
4. Click **Edit**. The Edit Roles wizard is displayed.
5. Update the existing Role.
6. Click **Set Conditions**. The Add Conditions wizard is displayed.
 - a. Enter **Title**.
 - b. (Optional) Enter **Description**.
 - c. (Optional) Enter a **Condition** in **Raw View**.

Note

- Ensure the correctness of the logical expressions (conditions) you add. Neither CCKM nor GCP checks for the logical validity of the added conditions.
- Provide input in valid formats. CCKM performs input data validation similar to GCP.

Enter the details in the text area.

- d. Click **Save**.

To add additional roles, click **Add More Roles**.

7. Click **Update**.

Removing Principals

To remove the principals:

1. Expand **PERMISSIONS**.
-

2. Expand the desired **Role**.
3. Under the expanded role, click the overflow icon () corresponding to the desired principal.
4. Click **Remove**. The Remove Principal dialog box is displayed.
5. Click **Remove**.

On successful deletion, a Google key updated successfully message is displayed on the screen.

Note

After all the principals are removed from a role, the role will be deleted automatically.

Re-Importing a Google Cloud Key Version

To re-import a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired version.
5. Click **Re-Import**. The Re-Import Key wizard is displayed.

Note

If you want to re-import the key version, ensure that the state of the version is **Import Failed** or **Destroyed** and the re-import eligibility is **True**. Also, even if these conditions are met, you cannot re-import all the key versions.

6. Under **Select Method**, select the desired method to re-import the key, the options are **Create/Upload New Key Material** and **Clone Existing Key Material**.
7. Click the desired tab to view the instructions.

Create/Upload New Key Material

- a. Select the **Source**. The options are **CipherTrust (Local)**, **Vormetric DSM**, and **Luna HSM**.

Note

For some key materials, the source might already be selected.

- b. Click **Next**. The **Configure Source Key** tab is displayed.

CipherTrust (Local) as a source

- a. Select the Key Type. You can select **Symmetric** or **Asymmetric**.
- b. Enter the **Key Name**.
- c. (Applicable to Asymmetric key type) Select the **Algorithm**. You can select **RSA** or **EC**.

Vormetric DSM as a source

- a. Select the Encryption Type. You can select **Symmetric** or **Asymmetric**.
- b. Enter the **DSM Key Name**.
- c. (Optional) Enter the **Description**.
- d. Select a DSM Domain from the list drop-down list.
- a. (Applicable to Asymmetric Encryption type) Select an **Algorithm**. You can select **RSA-2048**, **RSA-3072**, or **RSA-4096**.

Luna HSM as a source

- a. Enter **Luna HSM Key Label**.
- b. Select **Partition ID**.
- c. Select **Mechanism**.
- d. Select **Key Size**. The options are **2048**, **3072**, and **4096**.
- e. Select the **Key Attributes**.

Clone Existing Key Material

- a. Select the **Source**. The options are **CipherTrust (Local)**, **Vormetric DSM**, and **Luna HSM**.

Note

For some key materials, the source might already be selected.

- b. Click **Next**. The **Configure Source Key** tab is displayed.

Note

By default, the selected Algorithm and Key Size are AES and 256, respectively.

- a. Select a Key from the list.

8. Click **Re-Import**.

Google Cloud Reports

CCKM provides options to generate key visibility reports based on:

- Key-related activities between CCKM and Google Cloud key rings
- Track keys by their expiration dates

Google Cloud reports are categorized as:

- **Key Activity Report:** Inspect individual Google Cloud key histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and Google Cloud key ring.
- **Key Aging Report:** Track keys by their expiration dates. Audit a range of dates, from past material deletions to future scheduled deletions, within the selected Google Cloud key ring.

Use the Google Cloud reports to:

- Generate a report
- View the list of existing reports
- View details of a particular report
- Delete a report from CCKM
- Download the content of a report in CSV

Creating Google Cloud Reports

To create a Google Cloud report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Google**. The Google Reports page is displayed.
3. Click **Add Report**. The Choose Report Type and Name screen of the Add Google Report wizard is displayed.
4. Select a report type. The options are:
 - Key Activity Report
 - Key Aging Report
5. Specify a **Report Name**. This is a mandatory field.
6. Click **Next**. The Select Google Parameters screen is displayed.
7. Select a key ring from **Key Rings** drop-down list.
8. Click **Add**. The selected Google Key Ring is displayed under Selected Key Rings Parameters. Add more key rings, if required.
9. Click **Next**. The Set Start and End Dates screen is displayed.
10. In the **Include Entries From** field, specify the start date and time for the report.
 - Click the field and select the date and time on the on-screen calendar.
 - Alternatively, enter the time in **MM/DD/YYYYHH:MM** format.
11. In the **To** field, specify the end date and time for the report.
12. Click **Save**.

A success message **Created report** is displayed. The newly created report is displayed under the Google Cloud reports list. The report status becomes Running Now.

Viewing Google Cloud Reports

The Google Reports page displays the list of existing reports. Filter the reports by their names.

To view existing Google Cloud reports:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Google**. The list of available reports is displayed. The following details are displayed:

Column Name	Description
Report Name	Name of the report.
Run Date	When the report is run.
Type	Type of the report. The type can be: • Key Activity • Key Aging
Start Date	Start date from when the report is generated. If a report is run now, its status becomes Running Now.
End Date	End date for the report.

Viewing Details of a Google Cloud Report

To view the details of a Google Cloud report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Google**. The list of available reports is displayed.
3. Click the desired **Report Name** link.

Alternatively, click the overflow icon () corresponding to the desired report and click **View**.

4. View the report details.

The page is divided into:

- Mini detail view: Shows basic report details such as Cloud Service, Report Type, Start Date, End Date, and Overall Status.
- KEY RINGS: Expand to view the included key rings.
- REPORT DETAILS: Filter the report by Key Name, Key Ring, and Project. The following details are displayed:

Field	Description
Key Name	Name of the Google Cloud report.
Key Ring	Name of the linked Google Cloud key ring.
Project	Name of the Google Cloud project.
Location	Location of the Google Cloud project where the key ring resides.
Expiration Date	(Key Aging reports only) Date and time when the report expires.

Field	Description
Key Activity	(Key Activity reports only) Activity performed on the Google Cloud key.
Modified Date	(Key Activity reports only) Date and time when the key is modified.
User Name	(Key Activity reports only) User who performed the key activity.

Downloading Google Cloud Reports

To download a Google Cloud report as a CSV file:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Google**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired report and click **Download**.

Alternatively, click the desired report under **Report Name**, and click **Download CSV** in the detail view.

The report is downloaded as a CSV file.

Deleting Google Cloud Reports

To delete a Google Cloud report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Google**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired report and click **Delete**. The Confirm Delete Report message is displayed.
4. Click **Delete Report**.

The report is removed from the list of reports.

Scheduling Operations

CCKM allows you to periodically refresh keys, rotate keys, or add KMS containers in the background. To refresh keys, rotate keys, or add KMS containers, you need to create schedule configuration. A schedule configuration defines when to run a refresh, rotation, or KMS container job. You can use either the basic or cron format to specify when the rotation, refresh, or KMS container job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- **Repeats:** frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- **at:** specific time at which the rotation or refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

" * * * * * "

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. Select **Schedule Type** as **Key Rotation**.
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Google** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.

-
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

Adding Key Refresh Schedule

A key refresh schedule synchronizes keys from linked Google Cloud accounts to Cloud Key Manager.

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Schedules**. The list of available schedules is displayed.
 3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
 4. **Select Schedule Type as Key Refresh.**
 5. Click **Next**.
 6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Google** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
 7. On the **"Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
-

- **Schedule Starts:** Specify time when the schedule starts.
- **Schedule Ends:** Unavailable by default, that is, the scheduler never expires.
- **Never:** Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will refresh keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
- c. Click **Next**.

8. On the **Add Key Rings** screen:

- a. Select the desired key ring from the **Refresh Keys from Selected Key Ring(s)** drop-down list.
- b. Click **+** button. Similarly, you can add more key rings. To remove an added key ring, click the close (X) icon in the name of the added key ring.

Alternatively, if you want to refresh all the existing key rings, select the **Refresh All Key Rings** check box. When selected, the **Refresh Keys from Selected Key Ring(s)** field becomes unavailable.

- c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created scheduled is displayed in the schedules list.

Automatic Cloud Key Discovery

A KMS container schedule automatically detects the KMS containers based on the Google Cloud connection and adds them to the CipherTrust Cloud Key Manager.

Adding a KMS container (key ring or project) to CCKM consumes one CCKM license count.

To add a KMS container schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Select Schedule Type screen of the Add New Schedule wizard is displayed.

Schedule Type

1. Select **Schedule Type** as **Add KMS Container**.
2. Click **Next**. The General Info screen is displayed.

General Info

1. Enter a unique **Scheduler Name**.

2. Select **Google** from the **Cloud Name** drop-down list.
3. (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
4. (Optional) Select **Enable Schedule** to enable the schedule.
5. Select a **Define Job Type**. You can select either **Discover Only** or **Discover and Add**.

Note

Discover Only lists all the discovered containers. Discover and Add adds all the discovered containers to the CCKM.

6. Click **Next**. The Connection & ACL Info screen is displayed.

Connection & ACL Info

1. Select a **Connection**.
2. (Optional) Enable or disable **Success Audit Event**.
3. In the ACCESS CONTROL section.
 - a. Click **Assign User/Group**. The Assign User/Group dialog box is displayed.
 - b. Select the desired user or group from the **User/Group** drop-down list.
 - c. Click **Save**. The newly added user/group is displayed under **Name** in the ACCESS CONTROL section.
 - d. Grant the permissions to the user/group, as appropriate.

Granting additional permissions

To grant the additional permissions, select the check box under the desired operation corresponding to the desired users or groups. The following permissions can be granted.

- View Keys, Add Key, Edit / Disable/ Enable, Synchronize, Upload
- Schedule Destroy, Cancel Destroy

To remove a permission, clear the check box under the desired operation.

- e. Remove a user or group.
 - a. Under **Unassign**, click **X** corresponding to the desired user/group. The Remove Group dialog box is displayed.
 - b. Click **Remove**.

- Click **Next**. The Schedule Config screen is displayed.

Schedule Config

- Configure **DURATION** for the scheduler. Specify the schedule start and end time:

- **Schedule Starts:** Specify time when the schedule starts.
- **Schedule Ends:** Unavailable by default, that is, the scheduler never expires.
- **Never:** Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

- Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
- Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

Viewing/Editing Schedules

To view/edit a schedule:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Schedules**. The Schedules page displays following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only)
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Creation time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration. Never is displayed if the schedule is set to never expire.
Status	Status of the scheduler configuration. Possible values are:

Field	Description
	• Enabled • Disabled

- Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

Alternatively, click the **Name** link corresponding to the desired schedule.

- Edit or configure the following fields:

- Optional, basic description of the schedule.
- Status of the scheduler configuration. Select **Enable Schedule** to enable the schedule, clear to disable.
- (For KMS Container schedule) Define Job Type.
- **CONNECTION & ACL INFO** details, refer to the add KMS container [Connection & ACL Info](#) section.
- Scheduler configuration parameters such as duration, frequency, and expiry time of the key. Refer to the key rotation [Schedule Config](#) screen, key refresh [Schedule Config](#) screen, or KMS container [Schedule Config](#) screen for details, as appropriate.

- Click **Update** to save the changes.

JOB HISTORY

The Schedules page also contains a section named JOB HISTORY. The JOB HISTORY section displays information related to a job such as Run Date, Job ID, Status, and Errors. Every time a schedule is run, a Job is created.

- For the KMS Container schedule, this section allows you to download the CSV report containing the list of Key Rings or Projects.

To download the report, click the overflow icon () corresponding to the desired schedule and click **Download Key Rings Only** or **Download Projects Only**.

- To view the details of the job, click the **Job ID** link corresponding to the desired job. The Job details page is displayed. It shows the list of Key Rings and Projects associated with the job along with their details.

To download the reports of Key Rings and Projects, go to the top left of the Job details page, click **Download**, and select a **report** from the drop-down menu. The options are **Key Rings Only**, **Projects Only**, and **Key Rings and Projects**.

Note

You can download the report after the schedule has run successfully.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.

-
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
 4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Downloading Google Metadata

Downloading Google Keys Metadata

CCKM users with permissions to view the keys can export and download the Google keys metadata displayed on the CCKM GUI. Filter the keys metadata to display on the GUI based on your requirements, for example, all keys created in the past 12 months, all keys residing in a specific Google key ring, and all keys based on a specific algorithm. You can then download the filtered metadata as a CSV file.

To download the Google keys metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Google**. The Key Rings tab of the Google page is displayed.
3. Filter the keys metadata based on your requirements.

Use the Search box to filter the keys. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The filtered Google keys metadata is downloaded as a CSV file.

Downloading Google Key Rings Metadata

CCKM users with permissions to view the Google key rings can export and download the key rings metadata displayed on the CCKM GUI. Filter the key rings metadata to display on the GUI based on your requirements. You can then download the filtered metadata as a CSV file.

Metadata of a maximum of 100 key rings can be exported and downloaded.

To download the Google key rings metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Google**. The Key Rings tab of the Google page is displayed.
3. Filter the key rings metadata based on your requirements.

Use the Search box to filter the key rings. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The filtered Google key rings metadata is downloaded as a CSV file.

Performance Summary

This section provides metrics and results of GCP performance testing.

Test Setup

Test Runner	
Operating System	Ubuntu 18.4
RAM	8 GB
Core	4

Appliance	
Build	2.11.0.8177
RAM	16 GB

Process

Scripts are written on top of the Locust Framework for load and stress testing. The testing is done for create, read, update, and delete (CRUD) key operations with respect to different numbers of virtual users (VUS) over parallel connections, one for every virtual user.

CRUD Operations

Expand the headings below to view performance numbers.

Response with request coverage in percentile (10 VUS, 180 seconds)

POST

Click the tabs to view performance numbers.

	[versionID]/ schedule-destroy								
Aggregated	Aggregated	393	192	20128	355	61986	1077	2.2	1.1

Table 2

Method	Name	50%ile (ms)	60%ile (ms)	70%ile (ms)	80%ile (ms)	90%ile (ms)	95%ile (ms)	99%ile (ms)	100%ile (ms)
GET	/cckm/ google/ keys/[id]/ versions	37000	37000	38000	39000	48000	53000	61000	62000
POST	/cckm/ google/ keys/[id]/ versions/ [versionID]/ schedule-destroy	1000	1100	1100	1200	1300	1500	1600	1700
Aggregated	Aggregated	30000	37000	37000	37000	39000	48000	59000	62000

Here, X% percentile indicates that X percent requests are completed before this time.

Response Stats for CRUD operations with Request Coverage in Percentile (VUS – 50, Duration:180s)

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform any CRUD operation.
- All the virtual users are spawned parallelly at the same time to perform each of these CRUD operations for the given duration.

Note

The delete operation includes listing key version(s) and schedule destroy. When multiple virtual users are executing the delete operation, more than 90% **Bad request** failures are observed with the status code 400. As the operation is synchronous, the behavior might be due a bottleneck on the GCP side when the requests are sent.

Google Cloud External Key Manager Resources

Google Cloud External Key Manager (EKM) is a cloud native service that provides access to an external key encryption key (KEK) for use as a wrapping key in Google Cloud Platform (GCP) Projects. CCKM integration with

Google Cloud EKM enables you to:

- **Manage endpoints** for KEKs for keys added to the key ring through GCP EKM
- **Configure and manage policy sets**

The AES256 wrap/unwrap KEK allows users, developers, and organizations to maintain separation between encrypted data at rest and encryption keys.

The benefits of using CCKM Google Cloud EKM Endpoints include:

- Secure generation, storage and protection of your KEK.
- Privately maintained key provenance, managed access control, and centralized key management.
- Full life cycle management of your encryption key.
- Visibility for compliance.

GCP allows users to use Cloud External Key Management (EKM) in the Google Cloud Key Management Service (KMS) for Google Projects. CCKM protects your data in the GCP while your **encryption keys are stored in CipherTrust Manager** outside of GCP. Users create a Key Encryption Key (KEK) in CCKM, create a Cloud EKM key in Google Cloud, using the KEK's URI to identify the externally-managed key in Google Cloud KMS, and use the keys to protect data in a Customer-Managed Encryption Key (CMEK) integration service, to encrypt data using a symmetric key, or to sign with an asymmetric key. In this scenario, Google Cloud KMS does not store the external key material.

Note

CCKM doesn't support Google BYOK for Google Trusted Partner Clouds (TPC).

The following diagram shows how the Cloud KMS and CCKM fit into the key management model, using BigQuery and Compute Engine as example services.

Note

If you are [deploying a new CipherTrust Manager instance](#) exclusively or primarily to use the Google Cloud EKM service, we recommend deploying the instance geographically close to one of the [Google Cloud KMS regions](#) where you intend to set up the Google Cloud KMS Key Ring.

We have tested the following Google Customer-Managed Encryption Key (CMEK) integration services for Google Cloud EKM:

- BigQuery
- Compute Engine

All other Google CMEK integration services for Google Cloud EKM are not validated by Thales, but are expected to work and are supported. Consult [Google EKM documentation](#) for the full list of Google CMEK services for EKM. Only CMEK services integrated with Google Cloud EKM are supported with CCKM EKM endpoints.

These are "Hold Your Own Key" (HYOK) integrations, where you manage and control the base KEK inside of CCKM. Google Cloud has additional CMEK services that do not follow the HYOK model and do not integrate with EKM.

The connection between Google Cloud and CCKM can take place over the internet, or mediated through a [Google Cloud Virtual Private Cloud \(VPC\) network](#).

Ubiquitous Data Encryption

CCKM provides another integration with EKM, called Google Cloud External Key Manager Ubiquitous Data Encryption (EKM UDE). While standard EKM protects data in use for CMEK services in Google Cloud, EKM UDE protects data as it moves between two environments, called workloads, mediated by Google Cloud KMS. The two workloads can be two Google Cloud Confidential VMs, two non-confidential environments (on-premises or cloud), or one Confidential VM and one non-confidential environment.

CCKM provides options in the EKM UI menus to [manage endpoints](#), [configure and manage policy sets](#), and configure confidential computing requirements for access to KEKs.

The UDE version of EKM provides additional security, access control and auditability guarantees, namely:

- the end-to-end encryption of Data Encryption Keys (DEKs) between workloads and the external key manager
- the leveraging of Confidential VMs to provide strong guarantees of the runtime privacy of customer data (data-in-use security)
- the use of independently-verifiable attestations of the runtime environment, allowing the EKM to strongly differentiate between protected and unprotected environments

An example architecture is shown below, showing a potential interaction between CCKM, Google Cloud Storage, and a Confidential VM. For any type of workload, CCKM holds the KEK needed to wrap and unwrap DEKs. Communications between CCKM and a Confidential VM require an Attestation of Confidentiality sequence for an additional guarantee that only the intended workload can access the KEK.

These CipherTrust Cloud Key Manager keys can be used in four main use cases within GCP:

1. A DEK is generated within a GCP confidential VM, then is wrapped by the CCKM KEK. The KEK is configured such that unwrapping of the wrapped key is only possible by an attested, verified confidential VM. You can place additional restrictions on instance ID, project ID, and zones, which limit KEK use to *specific* confidential VMs.
2. A DEK is generated on-premise, in a regular (non-confidential computing) environment, then is wrapped by the CCKM KEK. The data is uploaded to Google Cloud Storage (GCS) and the KEK is configured such that unwrapping of the wrapped key (and hence the protected data) is only possible by an attested, verified confidential VM. You can place additional restrictions on instance ID, project ID, and zones, which limit KEK use to *specific* confidential VMs.
3. A DEK is generated within a GCP confidential VM, then is wrapped by the CCKM KEK. The KEK is configured such that wrapping of the wrapped key is only possible in an attested, verified confidential VM, but that unwrapping is possible in a regular (non-confidential computing) environment. You can place additional restrictions on instance ID, project ID, and zones, which limit KEK use to *specific* confidential VMs.
4. A DEK is generated on-premise in a regular environment, then is wrapped by CipherTrust-managed KEK. The data is moved to another regular environment (on cloud or on-premise). The KEK is configured such that unwrapping of the wrapped data is possible in a second regular environment.

These four cases, respectively, give the following guarantees:

1. In case 1, the guarantee that the protected DEK/data is only accessible by a confidential VM.
2. In case 2, the guarantee that data encrypted on-premise and migrated to the cloud will only be accessible by a confidential VM.
3. In case 3, the guarantee that data retrieved from the cloud and decrypted, was originated in a confidential VM.
4. In case 4, the guarantee is that the data is only decryptable when the KEK is accessible.

Managing Google EKM Endpoints

Google Cloud External Key Manager (EKM) Service can access CipherTrust Cloud Key Manager (CCKM) after you meet some prerequisites.

Once this access is established, users in the '[CCKM Admins](#)' group and '[Key Users](#)' group can create and manage an endpoint in CCKM for Google Cloud EKM service to access a Key Encryption Key (KEK) using CCKM's GUI, CLI and REST API.

You can create a regular [EKM Endpoint](#) or an [External Key Manager Ubiquitous Data Encryption \(EKM UDE\) Endpoint](#). The architecture and use cases for the two endpoint types are described on the [Google Cloud External Key Manager Resources](#) page.

After you have created an endpoint, you can:

- [Edit the policies](#)
- [Rotate the KEK](#)
- [Change the base hostname](#)
- [Enable or disable](#) the wrapping and unwrapping operation. This allows you to avoid deleting the endpoint, and temporarily suspend Google Cloud EKM's ability to use the KEK.
- [Delete the endpoint](#)
- [View activity for a wrap or unwrap endpoint](#). Google Cloud Key Management Service (KMS) consumes these endpoints.
- [View attestation activity for an EKM UDE endpoint](#)

Prerequisites

To allow a connection between CipherTrust Manager and Google Cloud External Key Manager Service, some network and security configuration must be in place in both entities.

Google Cloud Platform Prerequisites

- A Google Cloud project using Cloud KMS must exist for the CCKM EKM integration's use. You can create a new project or choose an existing project in your Google Cloud account. You need to provide either a project ID or the private key file associated with the service account to add a Google project to CipherTrust Manager. The project ID is the simplest path to add the Google Cloud project just for EKM usage. The private key file is

required if you want add a Google Cloud connection to CipherTrust Manager.

- If you are using confidential computing environments for EKM UDE, an additional Google Cloud project needs to be associated with the confidential computing environments. A Google service account with the Identity and Access Management (IAM) permission `compute.instances.getShieldedInstanceIdentity` must have access to the project. This permission is required to carry out full verification of attestation evidence.
- If you wish to require [Key Access Justifications \(KAJ\)](#) you need to configure KAJ on Google Cloud.

CipherTrust Manager Prerequisites

- The CipherTrust Manager must have a public IP address with the web interface HTTPS port (default of 443) open. See [Planning Network Configuration](#) for details.
- The web interface port within CipherTrust Manager can be changed from the default port of 443 to another port. If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it BEFORE configuring the Google EKM service on CCKM. Also reflect this port change when creating an EKM endpoint on CCKM as part of the prerequisites for deploying EKM. **Changing the default port AFTER configuring Google EKM is not supported.**
- The CipherTrust Manager must be reachable through a Fully Qualified Domain Name (FQDN).
- The web interface must have a [TLS certificate signed by an external Certificate Authority \(CA\) trusted by Google Cloud Platform](#). Google Cloud trusts certificates issued by well-known public CAs such as Verisign. Alternatively, you can create a certificate chain with Google's [Certificate Authority Service](#) and upload the chain to CipherTrust Manager.

For correct operation of UDE in a cluster of CipherTrust Manager nodes, all of the nodes must be configured with the same TLS certificate. This requirement is a consequence of termination of TLS sessions for UDE occurring at the individual CipherTrust Manager nodes rather than at the cluster load balancer.

- A Google Cloud project using Cloud KMS must be added to the CipherTrust Cloud Key Manager before creating an endpoint.
- For EKM UDE endpoints using confidential computing environments, the Google Cloud project associated with the confidential computing environments must be added to CCKM through [connection manager](#) for CCKM to completely verify attestation evidence.

Prepare an EKM endpoint

Below, we provide steps to create a Google endpoint in the CCKM GUI and to make the endpoint available to Google Cloud EKM.

1. Add the Google Cloud project using Google Cloud KMS to CCKM.

This action consumes one [CCKM license cloud unit](#).

Note

These steps demonstrate the simplest configuration to add a Google project ID to CCKM just for EKM endpoints, without using an active connection to Google Cloud. If you want to monitor and manage a Google Cloud account connection and associated resources on CipherTrust Manager, you can also [add a Google Cloud connection using connection manager](#), and then use the connection to retrieve project IDs.

- a. On Google Cloud, create a new project or choose an existing one.
 - b. Copy the project ID.
 - c. In CipherTrust Manager, open the **Cloud Key Manager** application.
 - d. Navigate to **KMS Containers > Google** and open the **Projects** tab.
 - e. Click **Add Existing Project**
 - f. In the popup window, under **Select Method**, switch to **Manually Enter Project ID**.
 - g. In **Project ID**, paste in the project ID.
 - h. (Optional) Use the **Enable success audit events** toggle to enable or disable audit recording of successful operations within the given Google cloud project. This toggle is set to enable, by default.
 - i. Click **Add Project**.
2. Login as a user in the 'CCKM Admins' group to create the endpoint in the CCKM GUI.

Note

You can also create the endpoint with the REST API or CLI to to associate meta information with the endpoint. Use the `/v1/cckm/ekm/endpoints` endpoint in the [REST API](#), or `ksctl cckm ekm endpoints create --ekm-endpoint-create-jsonfile <meta_information_filename>` in the CLI.

3. Navigate to **Cloud Key Manager > Services > Google Cloud EKM Endpoints**.
4. Click **Create Endpoint**
5. Provide a **Name** and a **Key URI Hostname** for your endpoint. For the Key URI Hostname, enter the the FQDN of the CipherTrust Manager instance.

Note

The Key URI Hostname will be used to construct the URL Google will use to send requests to CipherTrust Manager and for JWT validations.

The web interface of the CipherTrust Manager must have a valid TLS certificate signed by a trusted CA.

If the SSL termination takes place at the CipherTrust Manager, the Key URI Hostname must match the FQDN of the CipherTrust Manager. If the SSL termination takes place at the load balancer in front of the CipherTrust Manager, the Key URI Hostname must match the FQDN of the public-facing load balancer. Wildcard certificates are supported.

Note

If you changed the web interface port within CipherTrust Manager from the default port of 443 to another port, ensure to add that same port number when configuring Key URI Hostname by specifying the new port number along with the Key URI Hostname. For example, example.com:8443.

6. Select **EKM endpoint** as the Endpoint type.

Note

Ubiquitous Data Encryption endpoint steps are described [below](#).

7. Select either **Symmetric** or **Asymmetric** for **Key Type** of the KEK. If selecting **Symmetric**, click **Next** thereafter. If selecting **Asymmetric**, select key algorithm from the **Key Algorithm** drop down and click **Next**.

Endpoints with symmetric keys can be used for wrapping and unwrapping operations, whereas endpoints with asymmetric keys can be used for signing and fetching the public key.

Symmetric key type is always an AES-256 symmetric key. Symmetric keys for EKM endpoints must have the Encrypt, Decrypt, Wrap, and Unwrap usage masks. In addition, this key type must not be exportable or deletable.

Asymmetric key type has several RSA and EC algorithm options. Asymmetric keys for EKM endpoints must have the Sign and Verify usage masks. In addition, this key type must not be exportable or deletable. The available key algorithms for asymmetric keys are:

- RSA_SIGN_PSS_2048_SHA256

- RSA_SIGN_PSS_3072_SHA256
- RSA_SIGN_PSS_4096_SHA256
- RSA_SIGN_PSS_4096_SHA512
- RSA_SIGN_PKCS1_2048_SHA256
- RSA_SIGN_PKCS1_3072_SHA256
- RSA_SIGN_PKCS1_4096_SHA256
- RSA_SIGN_PKCS1_4096_SHA512
- EC_SIGN_P256_SHA256
- EC_SIGN_P384_SHA384

8. Choose to either create a new key or copy an existing key.

If creating a new key, select **Create New Key**, enter the name of the key, and click **Next**. If copying an existing key, select **Copy Existing Key**, select a key from the **Key** drop down, and click **Next**.

Caution

Although it is possible to copy a key that is associated with an existing EKM or EKM UDE endpoint, we recommend that you do not do this.

Note

The **Copy Existing Key** option is applicable to the migration of an EKM endpoint from one CipherTrust Manager deployment to another. When creating a new EKM endpoint in the new deployment using this option, CCKM uses the key name you select from the **Key** drop down and associates all of the existing versions of a CipherTrust Manager key to the new endpoint.

9. Edit the Endpoint Policy.

- a. Provide a comma-separated list of Google service accounts in the format **service-PROJECT_NUMBER@gcp-sa-ekms.iam.gserviceaccount.com** that have access to the endpoints specified in the **Clients** field.
- b. Edit the Key Access Justification settings. You can disable the requirement for Key Access Justifications, or specify which justification reasons are needed for the EKM endpoint to initiate a wrap or unwrap

request.

- c. Click **Next**.

Note

You can edit these [endpoint policies](#) later, if desired.

10. Review your settings and click **Add Endpoint**.

The EKM endpoint is created.

Caution

Modify endpoints only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not modify the KEK using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the KEK unavailable to the Google Cloud EKM service.

11. Enable [Key Access Justifications](#) in your Google Account, if you require this feature, and you have not already enabled this feature.
12. Proceed to [establish a connection between Google Cloud and the endpoint](#).

Prepare an EKM UDE endpoint

1. Add the Google Cloud project using Google Cloud KMS to CCKM.

This action consumes one [CCKM license cloud unit](#).

Note

These steps demonstrate the simplest configuration to add a Google project ID to CCKM just for EKM endpoints, without using an active connection to Google Cloud. If you want to monitor and manage a Google Cloud account connection and associated resources on CipherTrust Manager, you can also [add a Google Cloud connection using connection manager](#), and then use the connection to retrieve project IDs.

- a. On Google Cloud, create a new project or choose an existing one.

- b. Copy the project ID.
 - c. In CipherTrust Manager, open the **Cloud Key Manager** application.
 - d. Navigate to **KMS Containers > Google** and open the **Projects** tab.
 - e. Click **Add Existing Project**
 - f. In the popup window, under **Select Method**, switch to **Manually Enter Project ID**.
 - g. In **Project ID**, paste in the project ID.
 - h. (Optional) Use the **Enable success audit events** toggle to enable or disable audit recording of successful operations within the given Google cloud project. This toggle is set to enable, by default.
 - i. Click **Add Project**.
2. Login as a user in the 'CCKM Admins' group to create the endpoint in the CCKM GUI.

Note

You can also create the endpoint with the REST API or CLI to to associate meta information with the endpoint. Use the `/v1/cckm/ekm/endpoints` endpoint in the [REST API](#), or `ksctl cckm ekm endpoints create --ekm-endpoint-create-jsonfile <meta_information_filename>` in the CLI.

3. Navigate to **Cloud Key Manager > Services > Google Cloud EKM Endpoints**.
4. Click **Create Endpoint**
5. Provide a **Name** and a **Key URI Hostname** for your endpoint. For the Key URI Hostname, enter the the FQDN of the CipherTrust Manager instance.

Note

The Key URI Hostname will be used to construct the URL Google will use to send requests to CipherTrust Manager and for JWT validations.

The web interface of the CipherTrust Manager must have a valid TLS certificate signed by a trusted CA.

If the SSL termination takes place at the CipherTrust Manager, the Key URI Hostname must match the FQDN of the CipherTrust Manager. If the SSL termination takes place at the load balancer in front of the CipherTrust Manager, the Key URI Hostname must match the FQDN of the public-facing load

balancer. Wildcard certificates are supported.

Note

If you changed the web interface port within CipherTrust Manager from the default port of 443 to another port, ensure to add that same port number when configuring Key URI Hostname by specifying the new port number along with the Key URI Hostname. For example, example.com:8443.

6. Select **Ubiquitous Data Encryption Endpoint** as the Endpoint type. Click **Next**.
7. Select the requirement for Confidential VMs to originate wrap or unwrap requests. You can select **Not Required**, required **For Wrap and Unwrap**, required **For Wrap** only, or required **For Unwrap** only.
8. Choose to either create a new key or copy an existing key.

If creating a new key, select **Create New Key**, enter the name of the key, and click **Next**. If copying an existing key, select **Copy Existing Key**, select a key from the **Key** drop down, and click **Next**.

Caution

Although it is possible to copy a key that is associated with an existing EKM or EKM UDE endpoint, we recommend that you do not do this.

Note

The **Copy Existing Key** option is applicable to the migration of an EKM endpoint from one CipherTrust Manager deployment to another. When creating a new EKM endpoint in the new deployment using this option, CCKM uses the key name you select from the **Key** drop down and associates all of the existing versions of a CipherTrust Manager key to the new endpoint.

The supported key type is AES-256. Valid keys must have the Encrypt, Decrypt, Wrap, and Unwrap usage masks and cannot be exportable or deletable.

9. Specify the endpoint policy.
 - a. Provide a comma-separated list of Google service accounts in the format **service-**

`PROJECT_NUMBER@gcp-sa-ekms.iam.gserviceaccount.com` that have access to the endpoints specified in the `Clients` field.

- b. Edit the Key Access Justification settings. You can disable the requirement for Key Access Justifications, or specify which justification reasons are needed for the EKM endpoint to initiate a wrap or unwrap request. Click **Next**.

Note

You can edit these [endpoint policies](#) later, if desired.

- c. Specify policies for **UDE Attestation**. The values for **Zones**, **Project IDs** and **Instance Names** constrain which workloads can use the EKM UDE Endpoint, and are enforced whenever a Confidential VM originates a request.

- d. Click **Next**.

10. Review your settings and click **Add Endpoint**. Click **Close** to close.

A unique URI is created, associated with the KEK that acts as the Google EKM UDE endpoint key. The hostname is applied to the URI, to create a path that Google Cloud can access.

Caution

Do not edit the KEK through the general CipherTrust Manager key management functions. Do not modify the KEK through the **Keys** menu in the GUI, **ksctl keys** commands in the CLI, or the `/v1/vault/keys2` endpoint in the REST API. This can result in the KEK becoming unavailable to the Google Cloud EKM service unexpectedly.

11. If you intend to use one or more confidential computing environments, you must add an additional Google Cloud project associated with the confidential computing VMs. [Add a Google Cloud connection on CipherTrust Manager through Connection Manager](#). You need to provide the private key file associated with the service account.

Note

For this case, the Google Cloud project needs to be associated with a Google service account with the Identity and Access Management (IAM) permission `compute.instances.getShieldedInstanceIdentity`. This ensures CCKM can fully verify

attestation evidence.

12. Enable [Key Access Justifications](#) in your Google Account, if you require this feature, and you have not already.
13. Proceed to [establish a connection between Google Cloud and the endpoint](#).

Establish a Connection Between Google Cloud and the Endpoint

Google Cloud configuration to connect to the endpoint depends on whether the connection is over the internet or Google Cloud VPC.

EKM over internet

If you want to set up EKM communication over the internet, follow [Using Cloud EKM via the Internet Google documentation](#) to create the necessary Google Cloud EKM key. You need the following values related to CipherTrust Manager:

- The full Key URI, including hostname, of the EKM endpoint.
- The geographical region where the CipherTrust Manager instance is deployed. In Google Cloud, choose a location for the Key Ring that is as close as possible to reduce network latencies.

EKM over VPC

If you want to set up EKM communication over VPC, follow [Using Cloud EKM with VPC Google documentation](#) to create the necessary Google Cloud entities and connections. On Google Cloud, you need to:

- prepare a VPC network.
- create a Service Directory service endpoint using the private IP address of CipherTrust Manager and port 443.
- authorize CloudEKM to access the VPC.
- create a connection using Location, Service Directory, EKM Hostname (CipherTrust Manager hostname), and CipherTrust Manager web certificate. This connection is created in your key project using KMS infrastructure.
- create a Cloud EKM key using the EKM or EKM UDE endpoint Key URI path.

Do the following to obtain CipherTrust Manager-related values needed by Google Cloud:

1. Note the fully qualified domain name of the CipherTrust Manager. This value and the port number **443** are needed to create the Service Directory service endpoint.
2. Download the web interface certificate.

```
ksctl interfaces certificate get --name web --icertfile <desired-filename>.pem
```

On the web console, this certificate is available at **Admin Settings > Interfaces**.

3. Convert the downloaded certificate to DER format. This is needed to create the EKM connection on Google Cloud.

```
openssl x509 -outform der -in <filename>.pem -out <filename>.der
```

4. Make a note of where the CipherTrust Manager is geographically deployed. In Google Cloud, choose a location for the EKM connection that is as close as possible to reduce network latencies.
5. Copy the Key URI path of the EKM or EKM UDE endpoint. When you create the corresponding Cloud EKM key, provide the Key path in the format `api/v1/cckm/ekm/endpoints/<endpoint_id>`. Do **not** include the CipherTrust Manager hostname in the path.

Once a connection is established, consult documentation for your desired [Google CMEK service integrated with Cloud EKM](#) to grant permissions for the CMEK service to use the KEK in Cloud KMS. Consult this documentation as well for particular encryption and decryption scenarios for the CMEK service.

For example:

- Protecting BigQuery data with Cloud KMS keys
- Protecting Compute Engine resources with Cloud KMS keys

Note

Only CMEK services integrated with EKM are supported with CCKM EKM endpoints. These are "Hold Your Own Key" (HYOK) integrations, where you manage and control the base KEK inside of CCKM. Google Cloud has additional CMEK services that do not follow the HYOK model and do not integrate with EKM. Consult [Google Cloud EKM documentation](#) for a list of supported CMEK services.

For using the EKM UDE functionality either on premise or in a confidential VM, consult the [Google Cloud Platform open source repository for the Split Trust Encryption Tool](#).

Rotate the Key Encryption Key

For EKM UDE endpoints, and EKM endpoints using symmetric key type, you can create a new version of the KEK which will be applied to future wrap operations. This can be done even if the endpoint is disabled. Rotating the KEK regularly is a security best practice.

Note

There is no extra configuration required on Google Cloud. The next time Google Cloud tries a wrap operation with the KEK, the new key material is automatically used to wrap.

You can also post to the `/v1/cckm/ekm/endpoints/{id}/rotate` REST API endpoint, as described in the API Guide, or use `ksctl cckm ekm endpoints rotate --id <endpoint_id>` in the CLI.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager>Services>Google Cloud EKM**.
3. Find the endpoint in the list, and click the ellipsis icon (...) at the far right for options.

4. Select **Rotate**.

Change the base hostname

You can also patch the `/v1/cckm/ekm/endpoints/{id}` REST API endpoint, as described in the API Guide, or use `ksctl cckm ekm endpoints update --id <endpoint-id> --hostName <new-base-url-hostname>` in the CLI.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager>Services>Google Cloud EKM**
3. Find the endpoint in the list, and click the ellipsis icon (...) at the far right for options.

- Click **View/Edit**.
- In the **General Info** section, enter a new **Key URI hostname** and click **Update**.

Enable or Disable Key Wrapping

You can post to the `/v1/cckm/ekm/endpoints/{id}/enable` and `/v1/cckm/ekm/endpoints/{id}/disable` REST API endpoints, as described in the [API Guide](#). In the CLI, you can use `ksctl cckm ekm endpoints enable --id <endpoint-id>` and `ksctl cckm ekm endpoints disable --id <endpoint-id>`.

This is a way to temporarily remove and restore client access to an endpoint without permanently deleting the endpoint and its KEK.

In the GUI:

- Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
- Navigate to **Cloud Key Manager>Services>Google Cloud EKM**
- Find the endpoint in the list, and click the ellipsis icon(...) at the far right for options.

- Click **Enable** or **Disable**.

Delete the Endpoint

You can delete the `/v1/cckm/ekm/endpoints/{id}/REST API endpoint`, as described in the [API Guide](#). In the CLI, you can use `ksctl cckm ekm endpoints delete --id <endpoint-id>`. This permanently deletes the KEK.

Caution

Once the endpoint has been deleted, the key cannot be restored.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager>Services>Google Cloud EKM**
3. Find the endpoint in the list, and click the ellipsis icon(...) at the far right for options.

4. Click **Delete**.

A confirmation window appears, as this operation is irreversible.

5. Enable the **I wish to delete this endpoint** checkbox and click **Delete**.

View Activity for a Wrap or Unwrap Endpoint

Google Cloud KMS calls EKM endpoints to perform a wrap or unwrap operation on a base64 blob, and therefore protect some data on behalf of a CMEK service integrated with Cloud EKM such as BigQuery or Compute Engine. EKM UDE endpoints are called from workloads via Google-provided integration tools.

Standard EKM wrapping functionality is performed with `/v1/cckm/ekm/endpoints/{id}:wrap` and `/v1/cckm/ekm/endpoints/{id}:unwrap` REST API endpoints, as described in the [REST API endpoint](#). Google provided tools can find and make calls to wrap and unwrap endpoints without user intervention, if Google Cloud KMS has correctly configured the Cloud EKM key, and the CMEK service is correctly configured to access the key on Google Cloud KMS. This configuration happens as part of [preparing a new endpoint](#).

EKM UDE endpoints also allow for confidential wrapping and unwrapping, which requires the use of a secure session and a policy enforcement check with an authorized confidential VM, through `/v1/cckm/ekm/endpoints/{id}:confidentialwrap` and `/v1/cckm/ekm/endpoints/{id}:confidentialunwrap`.

Requests to these endpoints generate a record under **Records> Server Records** in the GUI, and the `/v1/audit/records` endpoint in the API. These records can be helpful to monitor EKM activity or troubleshoot EKM problems.

View Attestation Activity for an EKM UDE Endpoint

In EKMS, using an EKM UDE endpoint for wrap or unwrap operations requires a three-step process:

1. The establishment of a secure TLS 1.3 session between the Google-provided integration component and CipherTrust Manager.

2. The optional provision of attestation information/proofs over this secure session, allowing CCKM to assess the data-in-use protection capabilities of the requester.

Note

During this process, CCKM attempts to fetch a public key. This operation requires a Google service account with the IAM permission `compute.instances.getShieldedInstanceIdentity` registered with CCKM as a connection. If the public key cannot be fetched, an error is logged, `unable to check validity of instance key...` Wrap and unwrap operations are allowed to proceed.

3. The submission and handling of (confidential) wrap and unwrap requests, over this secure session.

The TLS sessions which are established have a session lifetime of 600 seconds, allowing multiple confidential wrap/unwrap requests to be handled by any given session. Thus, any confidential wrap or unwrap request can be associated with a secure channel and any secure channel can be associated with a set of attestation proofs (or none in the case of an on premise, non-confidential environment).

All relevant details are captured in **Records> Server Records** in the GUI, and the `/v1/audit/records` endpoint in the API, allowing cross-referencing of confidential wrap/unwrap requests with sessions with attestations.

Note

The EKM UDE API contains a set of 'Session' endpoints, namely: `session/begin session`; `session/handshake`; `session/negotiate attestation`; `session/finalize` and `session/end session`.

These endpoints allow the establishment of a secure TLS 1.3 session between the Google-provided integration component and CipherTrust Manager. Further details on these endpoints is beyond the scope of this document.

Managing Google EKM Endpoint Policies

When you create a Google External Key Manager (EKM) or EKM Ubiquitous Data Encryption (EKM UDE) endpoint, policies are associated with it to control which requests are processed. Users in the 'CCKM Admins' group can edit the EKM or EKM UDE endpoint policies. While the CipherTrust Manager web console and the REST API provide a basic format for editing policies, the **Raw** editing options requires understanding of the [Open Policy Agent \(OPA\)](#) policy engine.

If you wish to edit the Key Access Justification Reasons, this feature is described in detail in [Google Cloud Platform documentation](#).

Edit the Policies for EKM and EKM UDE Endpoints

To edit the policies, you can also patch the `/v1/cckm/ekm/endpoints/{id}/policies` [REST API](#)

`endpoint`, or use `ksctl cckm ekm endpoints policy update --id <policy-id> --ekm-endpoint-update-policy-file <filename>` to pass in a new policy file.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager>Services>Google Cloud EKM**
3. Find the endpoint in the list, and click the ellipsis icon(...) at the far right for options.

4. Click **View/Edit**.

The policy options are visible in the **Endpoint Policy** section. The **Basic View** is selected by default.

5. Skip to step 6 for editing in **Raw View**. In **Basic View**, you can edit the following policies:
 - Clients allowed to use the endpoint, specified as a list separated by commas. Google service accounts are in the format of an email address, `<service-account-name>@<project-id>.iam.gserviceaccount.com`.
 - Whether **Key Access Justifications** are required or not.
 - If **Key Access Justifications** are required, which justification reasons are accepted.
 - EKM UDE endpoints have additional fields for **Zones**, **Project IDs**, and **Instance Names**. These settings constrain which workloads can use the EKM UDE Endpoint, and are enforced whenever a Confidential VM originates a request.
6. In **Raw View**, you can edit the following parameters:
 - `package` controls the rego policy package name.
 - `default allow` is a mandatory line to declare whether the rego policy is enforced. Setting this to `false` enables the policy and setting it to `true` disables the policy.
 - `input.clients` controls which clients are allowed to access the endpoint. This should match the clients on Google Cloud Service Accounts that are allowed to perform wrap or unwrap operations.

- `default allowedJustification` controls whether [Key Access Justifications](#) are required or not.
- `input.justificationReason` controls what justification reason needs to be provided for Google Cloud EKM to initiate a wrap or unwrap operation. You can remove this line, or comment it out with `#` at the start of the line if you do not require the feature.
- EKM UDE endpoints have additional lines to set Zones, Project IDs, and Instance Names, which are `input.attestationZones`, `input.attestationProjectIDs`, and `input.instanceNames` respectively. These settings constrain which workloads can use the EKM UDE Endpoint, and are enforced whenever a Confidential VM originates a request.

7. Click **Update**.

Key Access Justifications

Justification reasons are used by the [Key Access Justifications](#) feature in Google Cloud. This feature is optional for EKM and EKM UDE. When justification reasons are set, they need to be provided for Google Cloud EKM to initiate a wrap or unwrap operation.

The supported justification reasons are:

- REASON_UNSPECIFIED
- CUSTOMER_INITIATED_SUPPORT
- GOOGLE_INITIATED_SERVICE
- THIRD_PARTY_DATA_REQUEST
- GOOGLE_INITIATED_REVIEW
- CUSTOMER_INITIATED_ACCESS
- GOOGLE_INITIATED_SYSTEM_OPERATION
- REASON_NOT_EXPECTED
- MODIFIED_CUSTOMER_INITIATED_ACCESS
- GOOGLE_RESPONSE_TO_PRODUCTION_ALERT
- MODIFIED_GOOGLE_INITIATED_SYSTEM_OPERATION
- CUSTOMER_AUTHORIZED_WORKFLOW_SERVICING

Note

These justification reasons appear with spaces instead of underscores and with lowercase letters in the

CipherTrust Manager GUI Basic View. For example, `GOOGLE_INITIATED_REVIEW` appears as **Google Initiated Review** in the Basic View.

In OPA format, this is expressed as:

```
package example
default allow = false
allow {
  # Uncomment and add specific clients in below line to allow wrap/unwrap from Google services
  # input.clients == {"abc@yahoo.com", "abc@google.com", "abc@msn.com"}[_]
  input.justificationReason == {"REASON_UNSPECIFIED", "CUSTOMER_INITIATED_SUPPORT", "GOOGLE_INITIATED_SERVICE", "THIRD_PARTY_DATA_REQUEST", "GOOGLE_INITIATED_REVIEW", "CUSTOMER_INITIATED_ACCESS", "GOOGLE_INITIATED_SYSTEM_OPERATION", "REASON_NOT_EXPECTED", "MODIFIED_CUSTOMER_INITIATED_ACCESS"}[_]
}
```

Google EKM Performance Summary

We have tested six environments to capture performance metrics for the CipherTrust Cloud Key Manager (CCKM) Google External Key Manager (EKM) integration. The results provided in this document demonstrate the effects of deployment choices on throughput for [EKM endpoint wrap operations](#). The results can help you plan your CipherTrust Manager deployment to meet your performance needs for Google EKM.

There is a Google requirement that wrap and unwrap requests must be completed within 150 ms and so results are presented to show the throughput possible before meeting that threshold.

Note

Actual performance numbers in your environment can be different. The results can vary based on factors such as how and where the CipherTrust Manager is deployed, CipherTrust Manager resources, the location of clients, the network connectivity, and how the traffic is load-balanced.

Tested Environments

All environments used an open source [k6.io tool](#) as the REST client, run from a Debian virtual machine. The Virtual Machine was hosted on Google Cloud Platform (GCP) in `us central 1a zone` with 8 vCPUs of 64 GB memory, and 50 GB memory disk.

The following CipherTrust Manager deployments were tested:

- Google Cloud Platform deployments:
 - [GCP Single Node with 4 CPUs 16 GB RAM](#)

- GCP Single Node with 8 CPUs 64 GB RAM
- GCP Two Node Cluster with 4 CPUs 16 GB RAM each
- GCP Two Node Cluster with 8 CPUs 64 GB RAM each
- AWS Cloud deployments:
 - AWS Cloud Single Node with 4 CPUs 16 GB RAM
 - AWS Cloud Single Node with 8 CPUs 64 GB RAM

CipherTrust Managers were deployed as geographically close to the `k6.io` client as possible, to avoid potential network latencies which can occur when crossing geographic regions. In your EKM deployment, we similarly recommend deploying the Virtual CipherTrust Manager instance geographically close to one of the [Google Cloud KMS regions](#) where you intend to set up the Google Cloud KMS key ring.

Network Requirements

The following ports were opened to ensure CipherTrust Manager/CCKM communication:

Type	Protocol	Port Range
SSH	TCP	22
HTTPS	TCP	443
PostgreSQL (for cluster)	TCP	5432

Test Process

The test consisted of starting a given number of virtual users to perform wrap operations on the EKM endpoint. Each user simulated a separate thread.

Total test duration was 40 seconds for each reading. The test was divided into the following increments:

- Ramp-up time was 5 seconds. Virtual users were started.
- Test duration was 30 seconds for each reading. Virtual users make wrap requests during that time.
- Ramp-down time was 5 seconds. Virtual users were stopped until there were zero active virtual users.

Repeating the Test in Your Environment

We have published the scripts used with `k6.io` on [Github](#), for you to repeat the tests in your own environments as desired.

Google Cloud Deployment Results

For each environment, operations per second are charted against response time (within 90% of the operations). The Google threshold of 150 ms is shown.

GCP Single Node with 4 CPUs 16 GB RAM

This deployment includes a single node with 4 CPUs and 16 GB memory. Both the CCKM instance and k6 client are on GCP. Here are details of this deployment:

Setup	System Volume	CPUs	Memory	CM Location
k6 Client	50 GB	8	64 GB	us-central1-a
CipherTrust Manager-2.11.1-9650	50 GB	4	16 GB	us-central1-a

Virtual Users	Run time	operations/second	Time taken (ms)
10	40	17.128677	12.28
20	40	34.131589	15.65
30	40	51.078121	21.17
40	40	67.495063	28.18
50	40	84.489887	25.68
60	40	99.229655	51.26
70	40	115.031462	74.41
80	40	128.49213	107.74
90	40	140.081857	167.61
100	40	147.564764	239.16
110	40	159.864781	231.13
120	40	170.39233	261.07

GCP Single Node with 8 CPUs 64 GB RAM

This deployment includes a single node with 8 CPUs and 64 GB memory. Both the CCKM instance and k6 client are on GCP. Here are details of this deployment:

Setup	System Volume	CPUs	Memory	CM Location
k6 Client	50 GB	8	64 GB	us-central1-a
CipherTrust Manager-2.11.1-9650	50 GB	8	64 GB	us-central1-a

Virtual Users	Run time	operations/second	Time taken (ms)
10	40	17.195846	10.71
20	40	34.483597	11.42
30	40	51.238013	14.41
40	40	68.537726	14.78
50	40	85.408548	13.61
60	40	102.824163	16.55
70	40	119.151866	15.62
80	40	136.375668	15.51
90	40	153.182252	16.48
100	40	171.242637	15.70

Virtual Users	Run time	operations/second	Time taken (ms)
110	40	187.627874	18.24
120	40	204.609053	21.36
130	40	220.006562	28.71

140	40	228.54225	36.32
150	40	244.991603	36.47
160	40	261.448303	35.99
170	40	277.951132	36.75
180	40	291.084292	47.64
190	40	309.021605	38.30
200	40	325.403116	47.22
210	40	340.395326	52.90
220	40	352.025967	72.09
230	40	367.930293	67.80
240	40	384.138939	72.09
250	40	401.465902	64.28
260	40	416.115064	66.41
270	40	427.417691	84.61
280	40	444.777548	74.32
290	40	461.519153	72.49
300	40	469.440098	94.77
310	40	479.391403	113.95
320	40	495.338039	110.28
330	40	509.461413	117.88

Virtual Users	Run time	operations/second	Time taken (ms)
340	40	514.51503	139.38
350	40	532.468021	132.88
360	40	543.400011	155.49
370	40	564.752063	139.05
380	40	576.253478	135.73
390	40	581.077997	172.77
400	40	591.480818	178.26
410	40	600.98002	206.44
420	40	611.056859	206.72

Conclusion

- Adding a second load balanced node scales performance approximately linearly. A larger performance increase was observed from adding CPU and RAM in each cloud environment.

Throughput comparison between single node and two node instances

Managing Google EKM Cryptospaces

GCP also allows users to use EKM in the Google Cloud Key Management Service (KMS) for the creation and management of external keys through VPC connections that support Cloud KMS EKM management mode. Using the Cloud KMS EKM management mode in the VPC connection to the EKM, you create and manage your external keys from the Google Cloud KMS. The key material of these keys are generated from the EKM (CipherTrust Manager). These external keys that are created and managed using this type of VPC connection are also referred to as coordinated keys.

In support of the VPC connection type of Cloud KMS EKM management mode, CCKM provides cryptospaces. A cryptospace is a logical workspace only available in CCKM in which a group of keys resides. It is within a CCKM cryptospace that coordinated keys are created, rotated, and destroyed through a VPC connection. The EKM cryptospace keys (also referred to as endpoints) can only be managed through the Google Cloud KMS (and not

through CipherTrust Manager or CCKM).

As part of creating a cryptospace in CCKM, grant your Cloud KMS service account access to your cryptospace and the keys to be created in it. In addition, set up a Key Access Justifications (KAJ) policy to define which access justifications should be allowed or denied. Keys created in a given cryptospace inherit the cryptospace's default KAJ policy. For more information about the required parameters, see [Create an EKM Cryptospace](#).

Note

CCKM doesn't support Google BYOK for Google Trusted Partner Clouds (TPC).

This page provides the prerequisites to allow a connection between a CipherTrust Manager and the Google Cloud External Key Manager Service. It also provides steps to create and update a cryptospace in CCKM and to manage the identity providers. After an EKM cryptospace is created, you can:

- Refresh EKM cryptospaces
- View EKM cryptospaces
- Change the base hostname
- Block or unblock a cryptospace
- Delete a cryptospace
- Update Confidential VM requirement
- Update service account
- Update cryptospace policy

To view cryptospace endpoints, refer to [Managing Google EKM cryptospace endpoints](#).

Note

This document assumes that you are familiar with Google Cloud EKM and Cloud EKM keys to protect your data.

Prerequisites

To allow a connection between CipherTrust Manager and Google Cloud External Key Manager Service, some network and security configuration must be in place in both entities.

Google Cloud platform prerequisites

- A Google Cloud project using Cloud KMS must exist for the CCKM EKM integration's use. You can create a

new project or choose an existing project in your Google Cloud account. You need to provide either a project ID or the private key file associated with the service account to add a Google project to CipherTrust Manager. The project ID is the simplest path to add the Google Cloud project just for EKM usage. The private key file is required if you want [add a Google Cloud connection to CipherTrust Manager](#).

- For the confidential computing environments for EKM UDE, an additional Google Cloud project needs to be associated with the confidential computing environments. A Google service account with the Identity and Access Management (IAM) permission `compute.instances.getShieldedInstanceIdentity` must have access to the project. This permission is required to carry out full verification of attestation evidence.
- If you wish to require [Key Access Justifications \(KAJ\)](#) you need to configure KAJ on Google Cloud.
- Refer to [Create an EKM connection via VPC](#) for information on how to create an EKM connection via VPC from the Google console. Note there are prerequisite steps for creating an EKM connection via VPC that are provided within this Google documentation, including preparing a VPC network, creating a Service Directory service endpoint, and authorizing Cloud EKM to access your VPC. Be sure to perform all required prerequisite steps. Also included in the prerequisite steps is high-level information about how to set up your EKM.
- Refer to [Create an external key](#) for information on how to create Cloud EKM keys on an existing key ring in Cloud KMS. Refer to [Create a coordinated external key](#) to create the coordinated external keys.

CipherTrust Manager Prerequisites

- The CipherTrust Manager must have an IP address that is accessible from Google KMS. This is done by setting up a VPC. See [VPC networks](#) for more information.
- You can change the default port of 443 for the CipherTrust Manager web interface. One would have to ensure to change it **BEFORE** configuring the given cloud service on CCKM. However, in the case of Google Cryptospace, Google only accepts and sends requests on the default port of 443. If you wish to use a different port for the web interface other than the default, add a network component, such as a load balancer or a firewall, in front of CipherTrust Manager. Then configure port mapping on this component by mapping port 443 to the non-default port on the CipherTrust Manager you plan to use. For more information, refer to [Support for Changing the Default Port of Web Interface Setting](#).
- The web interface must have a [TLS certificate signed by an external Certificate Authority \(CA\) trusted by Google Cloud Platform](#). Google Cloud trusts certificates issued by well-known public CAs such as Verisign. Alternatively, you can create a certificate chain with Google's [Certificate Authority Service](#) and upload the chain to CipherTrust Manager.

For correct operation of UDE in a cluster of CipherTrust Manager nodes, all of the nodes must be configured with the same TLS certificate. This requirement is a consequence of termination of TLS sessions for UDE occurring at the individual CipherTrust Manager nodes rather than at the cluster load balancer.

EKM UDE uses the same TLS certificate the CCKM web interface uses. If the TLS certificate for the CCKM web interface is updated, a restart of the CCKM service is required for the CCKM for UDE to use the updated certificate.

- A Google Cloud project using Cloud KMS must be added to the CCKM before creating a cryptospace.
- For EKM UDE endpoints using confidential computing environments, the Google Cloud project associated with the confidential computing environments must be added to CCKM through [connection manager](#) for CCKM to completely verify attestation evidence.

Create an EKM cryptospace

To create a Google EKM cryptospace in the CCKM GUI and to make it available to Google Cloud EKM.

1. Add the Google Cloud project using Google Cloud KMS to CCKM.

This action consumes one [CCKM license cloud unit](#).

Note

These steps demonstrate the simplest configuration to add a Google project ID to CCKM just for EKM cryptospaces, without using an active connection to Google Cloud. If you want to monitor and manage a Google Cloud account connection and associated resources on CipherTrust Manager, you can also [add a Google Cloud connection using connection manager](#), and then use the connection to retrieve project IDs.

- a. On Google Cloud, create a new project or choose an existing one.
- b. Copy the project ID.
- c. In CipherTrust Manager, open the **Cloud Key Manager** application.
- d. Navigate to **KMS Containers > Google** and open the **Projects** tab.
- e. Click **Add Existing Project**. The **Add Existing Google Project** screen displays.
- f. Under **Select Method**, select **Manually Enter Project ID**. This option allows you manually enter a project ID to connect to a project without credentials. This option is only applicable to creating and managing Key Encryption Keys (KEKs) for EKM usage.

The **Select From List** option allows you to select an existing project from a list of connections stored in CipherTrust Connection Manager. This option is applicable to creating and managing Google Cloud keys.

- g. In **Project ID**, paste in the project ID.
- h. (Optional) Use the **Enable success audit events** toggle to enable or disable audit recording of successful operations within the given Google cloud project. This toggle is set to enable, by default.
- i. Click **Add Project**.

2. Login as a user in the 'CCKM Admins' group to create the cryptospace in the CCKM GUI.

Note

You can also create the cryptospace with the REST API or CLI to to associate meta information with the endpoint. Use the `/v1/cckm/ekm/cryptospaces` endpoint in the [REST API](#), or `ksctl cckm ekm cryptospaces create --ekm-cryptospace-create-jsonfile <meta_information_filename>` in the CLI.

3. Navigate to **Cloud Key Manager > Services > Google Cloud EKM**.
4. Select the **CryptoSpace(s)** tab.
5. Select **Create CryptoSpace**. The General Info screen of the Create CryptoSpace wizard is displayed.

General Info

1. Specify a unique **Name** for the cryptospace.
2. (Optional) Enter a **Description** for the cryptospace.
3. Click **Next**. The CryptoSpace Settings screen is displayed.

CryptoSpace Settings

1. Select a **Google Cloud Type**. The options are **Google Cloud Platform** and **Trusted Partner Cloud**.
2. Specify a **Hostname**. This is the base url hostname for Ciphertrust Manager.
3. In the **Project ID** drop-down list, select the GCP project to be associated with this cryptospace in CCKM.
4. Add the location. The options are:
 - a. **Select Location From List**: Select the desired location of the cryptospace from the drop-down list.
 - b. **Manually Type Location**: Enter the desired Location.
5. Click **Next**. The CryptoSpace Type screen is displayed.

CryptoSpace Type

1. Select either **EKM CryptoSpace** or **Ubiquitous Data Encryption CryptoSpace** from the available CryptoSpace types. The default is **EKM CryptoSpace**.

The Ubiquitous Data Encryption CryptoSpace type allows you to create an EKM cryptospace that supports UDE. For this, the default requirement for Confidential VMs is **Not Required**. If selecting **Ubiquitous Data Encryption CryptoSpace**, select the requirement for Confidential VMs to originate wrap or unwrap requests under **Require Confidential VMs**. You can select **Not Required**, required **For Wrap and Unwrap**, required

For Wrap only, or required **For Unwrap** only.

2. Click **Next**. The Service Accounts screen is displayed.

Service Accounts

1. In **Service Account**, add the service account that is to be granted access to this cryptospace. Google service accounts are identified by an email in the form `service-account-name@project-id.iam.gserviceaccount.com`.
2. Click **Add Service Account**. The account is added to the Service Accounts section. Expand the caret icon to view the permissions assigned to this service account. By default, all the check boxes for the available permissions for the service account are selected. At least one permission must be selected for the given service account.

You can add multiple service accounts.

3. (Optional) Clear any permissions you wish to not use for the service account.
4. (Optional and applicable to Trusted Partner Cloud (TPC) only). Select the **Identity Providers** from the list.
5. Click **Update**.
6. Click **Next**. The CryptoSpace Policy screen is displayed.

CryptoSpace Policy

1. Provide the list of Google service accounts that are granted access to the endpoints in the **Clients** field, separating the clients with commas. Google service accounts are in the format of an email address, `<service-account-name>@<project-id>.iam.gserviceaccount.com`.
2. (Applicable to Google Cloud Platform only) Edit the Key Access Justification settings. You can disable the requirement for Key Access Justifications, or specify which justification reasons are needed for the EKM endpoint to initiate a wrap or unwrap request.
3. Click **Next**. The Review and Add screen is displayed.

Review and Add

1. Review your settings. To modify any of the sections (**GENERAL INFO**, **CRYPTOSPACE SETTINGS**, **CRYPTOSPACE TYPE**, **SERVICE ACCOUNTS**, or **CRYPTOSPACE POLICY**), click **Edit** for the given section.
2. Click **Create CryptoSpace**.
3. Click **Close**.

The EKM cryptospace is created.

After the EKM cryptospace is created, [create an EKM connection via VPC](#) from the Google console. As part of this step, select **Cloud KMS** as the **EKM management mode** and provide the cryptospace URL in the **Crypto Space path**. To obtain the cryptospace URL from CCKM, copy the path within the **Path** column of the **Cryptospace(s)** tab in the **Google Cloud External Key Manager** page. Note that there are prerequisite steps

provided within this Google documentation including preparing a VPC network, creating a Service Directory service endpoint, and authorizing Cloud EKM to access your VPC.

After you have created an EKM connection via VPC, proceed to [creating an external key](#) from the Google console. As part of creating an external key, select **External** under **Protection Level** and **via VPC** under **External key manager (EKM) connection type**. Select the EKM via VCP connection that you created from the drop-down list. Once the key is created, it displays on the **Key ring details** page within the Google console. It also then displays within **Cryptospace Endpoint(s)** tab in the **Google Cloud External Key Manager** page of CCKM. Thereafter, you can begin using these Cloud EKM keys to protect your data.

Refreshing EKM cryptospaces

To refresh all EKM cryptospaces:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Click the **CryptoSpace(s)** tab. The list of cryptospace added to CCKM is displayed.
4. Click **Refresh**.

The refreshed cryptospaces are listed on the **CryptoSpace(s)** page.

Viewing EKM cryptospaces

The **CryptoSpace(s)** tab shows the list of existing cryptospaces within CCKM. Search for cryptospace by Name or Project.

To view the list of Google cryptospace endpoints available on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Click the **CryptoSpace(s)** tab. The list of cryptospaces added to CCKM is displayed. The tab displays the following details:

Field	Description
Name	Name of the cryptospace.
Block	Indicates whether the cryptospace is blocked or unblocked.
CryptoSpace Type	Cryptospace type. There are two types of cryptospaces. One for EKM endpoints (ekm) and another for EKM UDE endpoints (ekm-ude).
Require Confidential VMs	Indicates whether a wrap or unwrap request is

Field	Description
	required to originate from a confidential VM.
Hostname	Base url hostname for Ciphertrust Manager.
Project	Name of the project.
Path	External-KMS-defined resource identifier for the cryptospace.
Endpoints	Number of endpoints within the cryptospace.
Location	Location of the cryptospace.
Google Cloud Type	Type of the Google Cloud - Google Cloud Platform or Trusted Partner Cloud (TPC).
Creation Date	Time when the cryptospace was created.

To view the custom columns, click the Customize View () icon, select the desired option, and click **OK** to display the column.

To view the Cryptospace details page, click on the name of the cryptospace under the **Name** column.

To view cryptospace endpoints, refer to [Managing Google EKM cryptospace endpoints](#).

Update the Description

In the GUI:

1. Login to the CipherTrust Manager GUI as a user of the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **View/Edit**.
6. In the **GENERAL INFO** section, enter a new **Description** and click **Update**.

Changing the base hostname

You can patch the `/v1/cckm/ekm/cryptospaces/{id}` REST API endpoint, as described in the API Guide, or use `ksctl cckm ekm cryptospaces update --id <cryptospace-id> --ekm-cryptospace-hostname <new-base-url-hostname>` in the CLI.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.

2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **View/Edit**.
6. In the **CRYPTOSPACE SETTINGS** section, enter a new **Hostname** and click **Update**.

Block or unblock a cryptospace

Blocking and unblocking a cryptospace is a way to temporarily suspend and restore access to the cryptospace and its keys.

You can block the `/v1/cckm/ekm/cryptospaces/{id}/block` REST API endpoint or unblock the `/v1/cckm/ekm/cryptospaces/{id}/unblock` REST API endpoint, as described in the API Guide. In the CLI, you can use `ksctl cckm ekm cryptospaces block --id <cryptospace-id>` to block a cryptospace and `ksctl cckm ekm cryptospaces unblock --id <cryptospace-id>` to unblock a cryptospace.

In the GUI:

1. Login to the CipherTrust Manager GUI as a user of the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **Block** or **Unblock**, depending on whether the cryptospace is currently in a blocked or unblocked state.
6. You are asked to confirm the action. Click **Block** or **Unblock** again.

The status in the **Blocked** column updates on the table.

Delete a cryptospace

You can delete the `/v1/cckm/ekm/cryptospaces/{id}/` REST API endpoint, as described in the API Guide. In the CLI, you can use `ksctl cckm ekm cryptospaces delete --id <cryptospace-id>`. This permanently deletes the cryptospace.

Caution

Once the cryptospace has been deleted, it cannot be restored.

In the GUI:

1. Login to the CipherTrust Manager GUI as a user of the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **Delete**.

A confirmation window appears, as this operation is irreversible.

6. Enable the **I wish to delete this cryptospace** checkbox and click **Delete**.

Update a Confidential VM requirement

You can patch the `/v1/cckm/ekm/cryptospaces/{id}` [REST API endpoint](#), as described in the API Guide, or use `ksctl cckm ekm cryptospaces update --id <cryptospace-id> --cvm-required-for-encrypt=true` in the CLI.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **View/Edit**.
6. Under **CryptoSpace Type**, select/enter the following details:

- a. From the available cryptospace types, select **Ubiquitous Data Encryption CryptoSpace**.

This option allows you to create an EKM cryptospace that supports UDE.

- a. Under **Require Confidential VMs**, select the requirement for Confidential VMs to originate wrap or unwrap requests. You can select **Not Required**, required **For Wrap and Unwrap**, required **For Wrap** only, or required **For Unwrap** only.
- b. Click **Update**.

Update a service account

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.

2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **View/Edit**.
6. Under **Service Accounts**, select/enter the following details:
 - a. In **Input Service Account(s)**, add the service account that is to be granted access to this cryptoSpace. Google service accounts are identified by an email in the form `service-account-name@project-id.iam.gserviceaccount.com`.
 - b. Click **Add Service Account**.

The account is added to the Service Accounts section. Expand the caret icon to view the assigned permissions and identity providers. By default, all the checkboxes for the available permissions for the service account are selected. At least one permission must be selected for the given service account.

 - a. Clear the permissions you don't wish to use.
 - b. (Optional) Select the identity providers you wish to use.
 - c. Click **Update**.
7. Click **Update**.

Update a cryptospace policy

A cryptospace endpoint inherits its policy from the cryptospace in which it resides. Changing Cryptospace policy affects all the endpoints that reside in this cryptospace.

In the GUI:

1. Login to the CipherTrust Manager products page as a user in the 'CCKM Admins' group.
2. Navigate to **Cloud Key Manager > Services > Google Cloud EKM > CryptoSpace(s)** tab.
3. Find the cryptospace in the list.
4. Click the overflow icon () corresponding to the cryptospace.
5. Click **View/Edit**

The policy options are visible in the **CryptoSpace Policy** section. The **Basic View** is selected by default.

6. Skip to step 6 for editing in **Raw View**. In **Basic View**, you can edit the following policies:
 - Clients allowed to use the cryptospace, specified as a list separated by commas. Google service accounts are in the format of an email address, `<service-account-name>@<project-`

```
id>.iam.gserviceaccount.com.
```

- Whether [Key Access Justifications](#) are required or not.
- If [Key Access Justifications](#) are required, which justification reasons are accepted.
- EKM UDE endpoints have additional fields for **Zones**, **Project IDs**, and **Instance Names**. These settings constrain which workloads can use the EKM UDE Endpoint, and are enforced whenever a Confidential VM originates a request.

7. In **Raw View**, you can edit the following parameters:

- `package` controls the rego policy package name
- `default allow` is a mandatory line to declare whether the rego policy is enforced. Setting this to `false` enables the policy and setting it to `true` disables the policy.
- `input.clients` controls which clients are allowed to access the endpoint. This should match the clients on Google Cloud Service Accounts that are allowed to perform wrap or unwrap operations.
- `default allowedJustification` controls whether [Key Access Justifications](#) are required or not.
- `input.justificationReason` controls what justification reason needs to be provided for Google Cloud EKM to initiate a wrap or unwrap operation. You can remove this line, or comment it out with `#` at the start of the line if you do not require the feature.
- EKM UDE endpoints have additional lines to set Zones, Project IDs, and Instance Names, which are `input.attestationZones`, `input.attestationProjectIDs`, and `input.instanceNames` respectively. These settings constrain which workloads can use the EKM UDE Endpoint, and are enforced whenever a Confidential VM originates a request.

8. Click **Update**.

Key Access Justifications

Justification reasons are used by the [Key Access Justifications](#) feature in Google Cloud. This feature is optional for EKM and EKM UDE. When justification reasons are set, they need to be provided for Google Cloud EKM to initiate a wrap or unwrap operation.

The supported justification reasons are:

- `REASON_UNSPECIFIED`
 - `CUSTOMER_INITIATED_SUPPORT`
 - `GOOGLE_INITIATED_SERVICE`
 - `THIRD_PARTY_DATA_REQUEST`
 - `GOOGLE_INITIATED_REVIEW`
-

- CUSTOMER_INITIATED_ACCESS
- GOOGLE_INITIATED_SYSTEM_OPERATION
- REASON_NOT_EXPECTED
- MODIFIED_CUSTOMER_INITIATED_ACCESS
- GOOGLE_RESPONSE_TO_PRODUCTION_ALERT
- MODIFIED_GOOGLE_INITIATED_SYSTEM_OPERATION
- CUSTOMER_AUTHORIZED_WORKFLOW_SERVICING

Note

These justification reasons appear with spaces instead of underscores and with lowercase letters in the CipherTrust Manager GUI Basic View. For example, `GOOGLE_INITIATED_REVIEW` appears as **Google Initiated Review** in the Basic View.

In OPA format, this is expressed as:

```
package example
default allow = false
allow {
# Uncomment and add specific clients in below line to allow wrap/unwrap from Google services
# input.clients == {"abc@yahoo.com", "abc@google.com", "abc@msn.com"}[_]
input.justificationReason == {"REASON_UNSPECIFIED", "CUSTOMER_INITIATED_SUPPORT", "GOOGLE_INITIATED_SERVICE", "THIRD_PARTY_DATA_REQUEST", "GOOGLE_INITIATED_REVIEW", "CUSTOMER_INITIATED_ACCESS", "GOOGLE_INITIATED_SYSTEM_OPERATION", "REASON_NOT_EXPECTED", "MODIFIED_CUSTOMER_INITIATED_ACCESS"}[_]
}
```

Managing Identity Providers

Google Trusted Partner Cloud (TPC) is an isolated environment with a unique identity from Google EKM. If you are configuring CCKM for a Google Trusted Partner Cloud (TPC) environment, you can add a specific identity provider to authenticate the Service Account.

Creating Identity Providers

An issuer or an openId configuration URL is required to create an identity provider.

To create an identity provider:

1. Open the **Cloud Key Manager** Application.

2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Under **IDENTITY PROVIDERS**, click **Add Identity Provider**. The Add Identity Provider screen is displayed.
4. Specify a unique **Name** for the provider.
5. Select the **Provider Verifier**.

The verifier can be:

- **Issuer:** Select and specify the valid **Issuer** and **jwtURL**.
- **OpenID Configuration URL:** Select and specify the **OpenId Configuration URL**. The URL must be valid. For example, when using SafeNet Trusted Access (STA) as an identity provider, the URL is represented by **WELL KNOWN CONFIGURATION URL** on the STA Management Console.

6. Click **Add**.
7. Click **Close**.

The newly created identity provider appears in the list of identity providers.

Viewing Identity Providers

The Google Cloud External Key Manager page shows the available identity providers. The **IDENTITY PROVIDERS** section shows the Name, Issuer, OpenID Configuration URL, and jwtURL.

To view the identity providers:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Navigate to **IDENTITY PROVIDERS**. The list of identity providers is displayed.

The following details are shown:

Column	Description
Name	Name of the identity provider.
Issuer	Issuer string from the identity provider JWT.
OpenID Configuration URL	URL of the OpenID configuration.
jwtURL	URL of JWKS.

Updating Identity Providers

To update an identify provider:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Under **IDENTITY PROVIDERS**, click the overflow icon () corresponding to the provider you want to edit.
4. Click **Edit**. The Edit Identity Provider screen is displayed.
5. Edit **Name**.
6. Click **Update**.

Deleting Identity Providers

When an identity provider is no longer needed, delete it from the CipherTrust Manager. Before deleting the provider, ensure that it is not in use by any endpoints.

To delete an identify provider:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Under **IDENTITY PROVIDERS**, click the overflow icon () corresponding to the provider you want to delete.
4. Click **Delete**. The Delete Identity Provider wizard is displayed.
5. Click **Delete Identity Provider**.

The identity provider is removed from the list of identity providers.

Managing Google EKM Cryptospace Endpoints

For an overview of EKM cryptospaces, refer to [Managing Google EKM cryptospaces](#)

After coordinated keys are created in a CCKM cryptospace from Google Cloud KMS through a VPC connection, these keys (or endpoints) are displayed within the **Cryptospaces Endpoints** tab of the **Google Cloud External Key Manager** page in CCKM.

Caution

Modify endpoints only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not

modify the KEK using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the KEK unavailable to the Google Cloud EKM service.

Steps to refresh, view, and update a Google EKM cryptospace endpoint using the CCKM GUI are provided on this page:

- Refreshing EKM cryptospace endpoints
- View EKM cryptospace endpoints
- View details of an EKM cryptospace endpoint
- Enable or disable a key version of an EKM cryptospace endpoint

Refreshing EKM cryptospace endpoints

To refresh all EKM cryptospace endpoints:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Click the **Cryptospaces Endpoints** tab. The list of cryptospace endpoints added to CCKM from Google Cloud KMS through a VPC connection is displayed.
4. Click **Refresh*.

The refreshed cryptospace endpoints are listed on the **Cryptospaces Endpoints** page.

Viewing EKM cryptospace endpoints

The **Cryptospaces Endpoints** tab shows the list of existing cryptospace endpoints residing within a given cryptospace. Search for endpoints by Google Key Name, Google Resource Name, Project, or Cryptospace.

To view the list of Google cryptospace endpoints available on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.
3. Click the **Cryptospaces Endpoints** tab. The list of cryptospace endpoints added to CCKM from Google Cloud KMS through a VPC connection is displayed. The tab displays the following details:

Field	Description
Google Key Name	Name of the Google key.
Project	Name of the project.
Location	Location of a cryptospace.
Key Type	EKM Key type. Options are either symmetric or asymmetric.
CryptoSpace	Cryptospace name.
CryptoSpace Type	Cryptospace type. There are two types of cryptospaces. One for EKM endpoints (ekm) and another for EKM UDE endpoints (ekm-ude).
Versions	Identifier of the latest version of the key. The latest version number will be the number of versions that the key contains.
Key Ring	The GCP Cloud KMS Key ring name corresponding to this cryptospace endpoint.
Google Resource Name	The name of the key that includes the full path to the resource.
Algorithm	EKM Key Algorithm. Supported values are EXTERNAL_SYMMETRIC_ENCRYPTION(AES256) , RSA_SIGN_PSS_2048_SHA256, RSA_SIGN_PSS_3072_SHA256, RSA_SIGN_PSS_4096_SHA256, RSA_SIGN_PSS_4096_SHA512, RSA_SIGN_PKCS1_2048_SHA256, RSA_SIGN_PKCS1_3072_SHA256, RSA_SIGN_PKCS1_4096_SHA256, RSA_SIGN_PKCS1_4096_SHA512, EC_SIGN_P256_SHA256,EC_SIGN_P384_SHA38

To view the custom columns, click the Customize View () icon, select the desired option, and click **OK** to display the column.

Viewing details of an EKM cryptospace endpoint

To view the details of a Google EKM cryptospace endpoints on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > Google Cloud EKM**. The Google Cloud External Key Manager page displays.

3. Click the **Cryptospaces Endpoints** tab. The list of cryptospace endpoints added to CCKM from Google Cloud KMS through a VPC connection is displayed.
4. On the **Cryptospaces Endpoints** tab, click the **Name** link of the desired cryptospace endpoint.

Alternatively, click the overflow icon () corresponding to the desired cryptospace endpoint, and click **View/Edit**.

The edit view of the CryptoSpace Endpoints page shows additional details of the selected endpoint under the **CRYPTOSPACE ENDPOINT POLICY** and **KEY VERSIONS** sections. Note that **CRYPTOSPACE ENDPOINT POLICY** is uneditable.

Enabling or disabling a key version of an EKM cryptospace endpoint

From the edit view CryptoSpace Endpoints page, you can enable or disable a key version of a cryptospace endpoint in the **KEY VERSIONS** section.

To enable or disable a key version of a cryptospace endpoint on CCKM:

1. Under the **KEY VERSIONS** section, click the overflow icon () corresponding to the desired key version.
2. Select **Enable** or **Disable** depending on the current configuration of the key version.

Google Workspace CSE Resources

Client Side Encryption (CSE) in Google Workspace enables encryption operations within the client, storing only encrypted data and encrypted keys in the cloud. AES symmetric keys are used to encrypt the user content.

Google Workspace CSE allows the users to secure:

- Calls over Google Meet
- Docs, Sheets, and Slides data inside a Drive
- Google Calendar events
- Gmail (Google email) messages

Content is secured with an external encryption key that Google servers cannot access. File and call contents are encrypted on the browser before being sent to Google servers for storage.

With Google Workspace CSE:

- Key ACL Service (KACLS) controls the top-level encryption keys that protect users' Gmail messages, Meet Calls, Calendar event data, and Google Drive (Docs, Sheets, and Slides data). KACLS is also referred to as external key management service in this document.
- The authorization to encrypt or decrypt an object is created by Google Workspace.
- End-user authentication is provided by a third-party identity provider.

- Only encrypted data and encrypted keys are sent to Google Workspace servers.

Note

X25519MLKEM768 key exchange algorithm is supported for TLS 1.3, as a quantum resilience cipher for Google Workspace CSE connections between Chrome and CipherTrust Manager/CCKM. You need to enable the PQC algorithm in Chrome flags and CipherTrust Manager. Refer to [TLS Key Exchange Groups](#) for more details.

Access Policies

Access to encryption keys is controlled using Google Workspace [perimeters](#). These are optional additional checks performed on the authentication and authorization tokens within the KACLS.

Access control can be used to:

- Only allow users denoted in the permitted list of domains to decrypt keys.
- Deny users, for example, customers' Google Workspace administrators.
- Provide advanced restrictions, for example:
 - Time-based restrictions: Is the employee on call, on vacation, and so on.
 - Geolocation restrictions: Prevent access from specific locations or networks.
 - User role/type based access as asserted by the third-party identity providers.

Refer to [Sample Custom Policies](#) for different scenarios.

High Level Architecture

The Google Workspace CSE library enables encryption operations within the client, storing only encrypted data and encrypted keys on the Google Workspace servers. End user authentication is provided by a third-party identity provider.

Google Workspace CSE allows the users to secure:

- Calls over Google Meet
- Docs, Sheets, and Slides data inside a Drive
- Google Calendar events
- Gmail (Google email) messages

Content is secured with an external encryption key maintained by the KACLS.

High Level Architecture

The following diagram shows the high level architecture:

Architecture for Gmail

The following diagram shows the high level architecture for Google Workspace CSE for **Gmail**:

Architecture for Key Migration

The following diagram shows the Google CSE key migration workflow:

Licensing

Thales provides encryption of Google Workspace CSE endpoints through CCKM licensing models. Google Workspace consumes one CCKM license (cloud unit) per endpoint.

The number of Google Workspace endpoints that can be added to the CipherTrust Manager is limited by the number of licenses purchased. For example, if a 1-year license is purchased for 10 cloud units, then only 10 Google Workspace endpoints can be added to the CipherTrust Manager.

An archived or deleted Google Workspace endpoint releases one cloud unit of the CCKM license. It means, you can add another licensed CCKM cloud unit to the CipherTrust Manager. A recovered, enabled, or disabled Google Workspace endpoint consumes one cloud unit of the CCKM license.

Refer to [CCKM Licensing](#) for details.

Prerequisites

Common Prerequisites

Before you can perform client side encryption:

1. Make sure you have a stable release of Google Chrome or Microsoft Edge installed and running.
2. Make sure your access to KACLs is not blocked by web filters, for example, Zscaler.
3. Make sure you have the **CCKM Admins** rights to perform Google Workspace CSE operations on the CipherTrust Manager.

4. Make sure that an identity provider system is set up correctly. For this, the identity provider admin uses either of following methods:

Using .well-known File Configuration

- a. Host the `cse-configuration` JSON file on a Web server. A sample JSON file looks like this:

```
{
  "name": "CSE IDP",
  "client_id": "<authenticationAud>",
  "discovery_uri": "<openidConfigurationURL>",
  "audience": "cse-test"
}
```

Here,

- `<authenticationAud>` is the ID of the third-party identity provider. For example, for Auth0, it is represented by the `Client ID`.
 - `<openidConfigurationURL>` is the identity provider configuration URL. For example, for Auth0, it can be `https://demo.auth0.com/.well-known/openid-configuration`.
- b. Create a sub-domain on the Google domain portal for the hosted Web server. Navigate to the **Google domain > DNS > Customer resource records** and add the IP address of the Web server with the name `cse`.

Using IdP Fallback Settings

- a. On the Google Admin Console, set identity provider configuration.
 - b. Specify the following fields:
 - **Name:** Name for the identity provider.
 - **Client ID:** The ID of the third-party identity provider. For example, for Auth0 and STA, it is represented by the `Client ID`.
 - **Discovery URI:** The identity provider configuration URL. For example, for Auth0, it can be `https://demo.auth0.com/.well-known/openid-configuration`, and for STA, it is represented by **WELL KNOWN CONFIGURATION URL**.
 - **Grant type:** Set as **Implicit**.
 - c. Test and save the settings.
5. (Applicable when a valid public DNS for the CipherTrust Manager is unavailable.) Create a subdomain for Thales key service (KACLS) on Google domain. Refer to [Creating a Subdomain on Google Domain](#).

6. Create a URL to access the KACLS. This URL is referred to as KACLS Endpoint URL in this document. Refer to [Creating a KACLS Endpoint URL](#) below.
7. Configure Google Workspace connection to KACLS. Refer to [Configure Google Workspace Connection to KACLS](#) for details.

Creating a Subdomain on Google Domain

Note

This section is applicable when a valid public DNS for the CipherTrust Manager is unavailable.

1. Log on to [Google domain](#) as a super admin for the user domain.
2. Navigate to **DNS > Custom resource records**.
3. Create a subdomain for the KACLS. Specify a name for your subdomain and the IP address or hostname of the KACLS.

Tip

If you are working in a clustered CipherTrust Manager environment, you need to create a clustered subdomain on Google domain. Refer to [Create a clustered subdomain on Google domain](#) for details.

Note

It is recommended to [add the Google NTP server](#) to the CipherTrust Manager (**Admin Settings > NTPs**).

Creating a KACLS Endpoint URL

A KACLS URL is needed to access the Thales key service. Google Workspace administrators use this URL to configure Google Workspace to communicate with the KACLS. Creating a KACLS URL requires an identity provider and a KACLS endpoint.

To create a KACLS endpoint URL:

1. **Create an identity provider.**
 - **GUI:** Refer to [Creating Identity Providers](#).
 - **API:** Refer to [Creating Identity Providers](#).

2. Create a KACLS endpoint.

- **GUI:** Refer to [Creating KACLS Endpoints](#).
- **API:** Refer to [Creating KACLS Endpoints](#).

Note

Before proceeding, make sure that the KACLS endpoint URL is accessible from the internet and KACLS is running.

Configure Google Workspace Connection to KACLS

To configure the Google Workspace connection to KACLS:

1. Open the **Google Admin** console.
2. Log on to the user domain as a super admin.
3. Navigate to **Data > Compliance > Client-Side Encryption**.

4. Click **Add external key service**.
5. Specify **Name of external key service**. This name will appear in error messages if Google Workspace cannot contact the key service.
6. Enter **URL of external key service**. This URL was created in [Creating a KACLS Endpoint URL](#).

Edit external key service

External Key Service

Add an external key service to connect to client-side encryption for select Google Workspace apps. This disables some of Google Workspace's cloud-based features. [Learn more](#)

Name of external key service
Thales

URL of external key service
https://beta-demo.thalesgsuiteintegration.net/api/v1/cckm/GoogleWorkspaceCSE/endpoints/077a6404

TEST CONNECTION

CANCEL CONTINUE

7. Click **TEST CONNECTION** to test that Google Workspace can communicate with the KACLS.
If the connection fails, correct the KACLS endpoint URL, ensure the Internet connectivity, and retry.
8. Click **CONTINUE**.
9. Click **SAVE**. The Google Workspace connection to KACLS is configured.

Configure KACLS at the Domain and/or Organization Units Level

To configure KACLS at the domain and/or organization units level:

Note

The Google Workspace admin can manage organizational units by navigating to **Directory > Organizational Units**.

1. Open the [Google Admin](#) console.
2. Log on to the user domain as a super admin.
3. Navigate to **Data > Compliance > Client-Side Encryption**.
4. Click **Assign**.

5. Select the **Domain/OU** that you want to assign the KACLS to.
6. Select the key service from the list.
7. Click **Save**.

Additional Prerequisites for Gmail

Apart from the prerequisites described above, perform these additional steps for Gmail:

1. Create an environment and enroll it with Google.
2. Enable Google Workspace CSE for intended Gmail users (senders and recipients).
 - a. Open the **Google Admin** console, <http://admin.google.com>.
 - b. Log on to the user domain as a super admin.
 - c. Navigate to **CSE settings: Data > Compliance > Client-Side Encryption**.

- d. Scroll down to the Apps section and click the **Gmail** link.
 - e. Select an organizational unit or group for which you want to enable Gmail CSE.
 - f. Under **User access**, select **ON**.
 - g. Save the settings.
3. Prepare your certificates.
 - a. Generate S/MIME certificates. Adhere to the Google-specified [certificate chain rules](#).
 - b. Wrap associated private keys using your KACLS endpoint URLs. Refer to [Encrypting Private Keys \(wrapprivatekey\)](#) for details.

-
- c. Upload the wrapped private keys and certificates to Google.
 - a. **Using Google Workspace Admin Console:** Use this method if you want Google to trust your own root CA.
 - a. Open the **Google Admin** console, <http://admin.google.com>.
 - b. Log on to the user domain as a super admin.
 - c. Navigate to **CSE settings: Apps > Google Workspace > Gmail**.
 - d. On the right, click **User settings**.
 - e. Click **S/MIME** and select **Enable S/MIME encryption for sending and receiving emails** and **Allow users to upload their own certificates**.
 - f. Click **ADD** to upload the root certificate. This root CA is the chain of intermediate and root certificates.
 - g. Save the changes.
 - b. **Using Gmail API client libraries:** Use this method to upload each user's S/MIME certificates and wrapped private keys using the API client libraries provided by Google.

Additional Prerequisites for Key Migration

Browser Requirement

The latest stable version of Google Chrome is installed and running.

Configure External Key Management (EKM) Service

To configure the external key management service.

1. Create a sub-domain for KACLS in the Google domain. Refer to [Creating a subdomain on Google domain](#) for details.
2. Create a KACLS Endpoint URL, refer to [Creating a KACLS Endpoint URL](#).

Configure Migration on KACLS

Using the API, you need to update the rewrap and privilegedUnwrap configurations on the following.

1. Old KACL
2. New KACL

Refer to the [Update a Rewrap Configuration](#) and [Update a Privileged Unwrap Configuration](#) APIs.

Configure Google Workspace Connection to KACLS

Refer to [Configure Google Workspace Connection to KACLS](#) for details.

Note

- To enable the key migration feature, you need to add an EKM service with backup enabled.
- You can only have one backup EKM service enabled at a time.

External key service

Name
test-migration-new

URL
https://test-migration-new.cckm-thalescpl.com/api/v1/cckm/GoogleWorkspaceCSE/endpoints/e9ca22f1-cc7e-4efa-86a0-9cb3d30790a7

Backup external key service
test-migration-old

EDIT **DISABLE & USE BACKUP** **REMOVE BACKUP**

- Ensure to turn on the "migration" toggle.

Additional Prerequisites for CSE Guest Access

Browser Requirement

The latest stable version of Google Chrome is installed and running.

Configure External Key Management (EKM) Service

To configure the external key management service.

1. Create a sub-domain for KACLS in the Google domain. Refer to [Creating a subdomain on Google Domain](#) for details.
2. Create an internal Identity Provider and Guest access Identity Provider. Refer to [Creating an Issuer](#).
3. Create a KACLS endpoint by adding both the Identity providers (internal and Guest) and enabling guest access. Refer to [Creating a KACLS Endpoint URL](#).

4. Validate KACLS Endpoint URL is accessible from the internet and KACLS is running.
5. Users will be given an Endpoint URL to access our key service (KACLS). The users will need this URL to configure Google Workspace to contact KACLS (CipherTrust Manager).

Additional Configurations for Guest Access on Google Admin Console

- The users need to configure Google Workspace Connection to KACLS. Refer to [Configure Google Workspace Connection to KACLS](#) for details.
- Configure a Guest access Identity Provider.

Note

Guest access configuration will require two client IDs per application(AUTHN and AUTHN2 above), used by the KACLS and Meet/Drive/Gmail backend respectively.

Additional Prerequisites for Bulk Import

To perform a bulk import, you must:

- Create a Google Cloud project to use Google Workspace APIs. For more information, see [Create a Google Cloud Project](#) for details.
- Enable the Google Drive API to view the list of active APIs. For more information, see [View & turn off Google Workspace APIs](#).
- Configure Domain Wide Delegation with your service account details. For more information, see [Enable Domain Wide Delegation](#).
- Upload your local files to Google Drive as client-side encrypted (CSE) files.

For more information on prerequisites for this feature, see [Drive CSE Upload GitHub folder](#).

Communication with KACLS

Google Workspace can communicate with KACLS for encryption and decryption of data, as described below.

Google Drive

Google Workspace can communicate with KACLS for encryption and decryption of files on Google Drive. Whenever a new file (**Blank encrypted document**) is created or updated, its data is encrypted automatically.

Also, when a new file is uploaded (using **Drive > File upload > Encrypt and upload**), the file is encrypted and uploaded. When an existing encrypted file is opened, its data is decrypted for authenticated end users.

Google Meet

Google Workspace can communicate with KACLS for encryption and decryption of calls over Google Meet (using **Meet > New meeting > Video call options > Security > Add encryption**).

Whenever an authenticated host initiates an encrypted call, the call data is encrypted automatically. The call data is automatically decrypted for authenticated participants.

Google Calendar

Google Workspace can communicate with KACLS for encryption and decryption of Google Calendar event data such as description, attachments, etc. (using **Calendar > Create**). Turn on the encryption toggle.

Whenever an authenticated host creates a Calendar event, the event description and attachments are encrypted automatically. The event data is automatically decrypted for authenticated recipients.

While creating the event, you can also add an encrypted Google Meet call by clicking **Add Google Meet video conferencing**.

Gmail

Google Workspace can communicate with KACLS for encryption and decryption of Gmail messages. (using **Gmail > Compose**). Click the **Message security** icon and **Turn on** the encryption.

Whenever an authenticated user composes an email message, the message details are encrypted automatically. The encrypted Gmail message is automatically decrypted for authenticated recipients.

If a key pair already exists, a new key pair cannot be inserted. To insert a new key pair, the existing key pair must first be deleted. The existing key pair can only be deleted if it is disabled for more than 30 days.

CSE Guest Access Support for Google Meet and Google Drive

Client-side encryption in Google Workspace enables encryption operations within the client, storing only encrypted files and encrypted keys in the cloud. AES symmetric keys are used to encrypt the user content. Google Workspace Client-side encryption (CSE) allows the user to secure Gmail messages, Meet Calls, Calendar event data, and Google Drive (Docs, Sheets, and Slides data) with an external encryption key that Google servers cannot access.

File contents are encrypted on the browser before being sent to Google servers for storage. With Google Workspace CSE, key ACL service (KACLS) controls the top-level encryption keys that protect users' Drive, Docs, Sheets, and Slides data.

Google Meet CSE provides a way to have end-to-end encrypted meetings by allowing enterprise workspace customers to use their own Identity Provider (IdP) and KACLS. Using their own IdP and KACLS infrastructure, users from a customer domain can participate in end-to-end encrypted meetings. Unfortunately, external accounts that do not belong to the customer domain, and cannot be authenticated using the internal IdP used by the customer, don't have a way to join CSE meetings which limits the usefulness of the CSE feature in its current form.

This problem will be addressed by allowing guest accounts that are authenticated using additional IdPs like Microsoft Azure ID, Google's Identity platforms or an alternative guest IdP provided by the host domain. The solution for Guest Access uses two ID tokens. This allows for the simultaneous operation of a primary IdP service while using a separate service to authenticate external guests.

Eligibility for Guest Accounts

In this feature, you will add support for external guests (outside the host's domain) to join Google Meet CSE calls. In this context, guest accounts are external participants that do not have:

- Any Google Account, any account registered with Google's identity service, regardless of actual domain or account license type (free or paid).
- A Google consumer account.
- A Google account that doesn't belong to the organizer's domain.

These accounts will instead rely on external IdP to access Google Meet to join calls such as "Sign in with Microsoft" and "Sign in with Google".

CSE Guest Access Workflow

A New CSE Join Flow for CSE Guest Accounts

This feature introduces a new join flow for anonymous CSE guest accounts. It allows an initially anonymous user to authenticate with a guest IdP and thereby establish an identity that Google can use to get access to the KACLs server (to encrypt/decrypt media) and authorize access to the meeting. Authenticated and unauthenticated Google users not logged in to the host domain's IdP are treated equally.

Allowed IdP Configurations are Provided when Loading the Meet page

Currently, an anonymous or non-invited user is directly rejected when loading a CSE meeting. This will now change to allow the user to authenticate with the guest IdP.

Upon loading the green room a guest account is presented with the IdP selection screen. In it, the user is challenged to authenticate using a guest IdP as configured by the meeting host organization.

The host organization name is displayed to the guest, and the guest is warned that they will be redirected to a third-party login page where they need to authenticate with the same email address as they were invited.

New Field Introduced in the Authorization Token

The Authorization token (AuthZ) generated by Google Drive (docs/slides/sheets) and meet is extended with a new claim "email_type". The possible values for the claim are:

- **google**: This email belongs to a Google account.
- **google-visitor**: This email does not belong to a Google account, but was PIN-code verified by Google. It is associated with guest access for Google Drive.
- **customer-idp**: This email does not belong to a Google Account, but the user's email was extracted using a customer-configured IdP. It is associated with guest access for Google Meet.

This claim may be unset. In this case, the default value is **google**.

Token Matching Logic

The email_type claim is guaranteed to be present when Google issues an AuthZ token for an email that does not correspond to a Google Account. This is introduced as a part of the "Guest Access" feature.

If a customer does not have Guest Access configured, all requests where email_type is set to `google-visitor` or `customer-idp` will be rejected. Requests with an email type of `google` or with an unset email type should continue to be accepted.

Google CSE support for Google's end-to-end encrypted email

Google Workspace can use the Key ACL Service (KACLS) to encrypt and decrypt Gmail messages. Google's end-to-end encrypted email ("Send to anyone") allows enterprise Gmail users to send end-to-end encrypted messages to any email address, without needing to configure S/MIME certificates for users.

Note

Google's end-to-end encrypted email is generally available (GA) as of October 2025. The GA release includes full support for the following scenarios:

- Sending emails to other Google Workspace domains
- Sending emails to @gmail.com consumer accounts
- Setting up a guest Identity Provider (IdP) for external recipients
- Sending emails to guest recipients

CipherTrust Manager version 2.22 and later will fully support all features introduced in Google's GA release.

Before enabling this client-side encryption, complete the prerequisites.

Prerequisites

The prerequisites include the following.

1. Create an environment and enroll it with Google.
2. Enable Google Workspace CSE for intended Gmail users (senders and recipients).
 - a. Open the **Google Admin** console, <http://admin.google.com>.
 - b. Log on to the user domain as a super admin.
 - c. Navigate to **CSE settings: Data > Compliance > Client-Side Encryption**.

- d. Scroll down to the Apps section and click the **Gmail** link.
 - e. Select an organizational unit or group for which you want to enable Gmail CSE.
 - f. Under **User access**, select **ON**.
 - g. Save the settings.
3. The Assured Controls or Assured Controls Plus add-on is required. End-to-end encrypted email is only available when hardware key encryption is not used.

Enable Send to anyone

To enable "Send to anyone" from the Google Admin console:

1. Open the [Google Admin](#) console.
2. Log on to the user domain as a super admin.
3. Navigate to **Data > Compliance > Client-Side Encryption > Gmail**.
4. Under **Encryption with guest accounts**, click the **Edit** icon.
5. Enable **Allow users to send client-side encrypted messages to recipients who aren't using S/MIME**.
6. Click **Save**.

Note

External recipients are granted guest accounts. These accounts:

- Reside within a dedicated organizational unit (OU) or group.
- Are fully owned by the customer's organization.
- Must adhere to the customer's organization's policies.

Admin controls allow Gmail users to access their accounts.

To enable "Send to anyone" for external Gmail domains and guests on CCKM:

1. When creating a new KACLS endpoint or updating an existing one, ensure to set the value of `allow_guest_access` to true. Refer to [Creating KACLS Endpoints](#) and [Updating a KACLS Endpoint](#) for details.
2. Set the value of the `authenticationAud` parameter to the Client ID of the Guest Identity Provider that has been configured in your Google Admin Console. Refer to [Additional Configurations for Guest Access on Google Admin Console](#) for details.

Clustering for Google Workspace

The CipherTrust Manager can be configured to support High Availability. When clustered, all CipherTrust Manager appliances in the cluster (called cluster nodes or nodes) will continuously synchronize their databases with each other. Any appliance in the cluster may be contacted for Google Workspace operations.

1. Create a CipherTrust Manager cluster. Refer to [Clusters and Nodes](#) for information on creating a CipherTrust Manager Cluster.
2. Create a clustered subdomain on Google domain:
 - a. Log on to [Google domain](#) as a super admin for the user domain.
 - b. Navigate to **DNS > Custom resource records**.
 - c. Create a subdomain for the KACLS cluster. Specify a name for your subdomain and the IP addresses or hostnames of all the clustered KACLS nodes.

Encrypting Data Encryption Keys

When a user opens a blank encrypted document, initiates an encrypted call, or creates an encrypted Calendar event, a random Data Encryption Key (DEK) is generated and the data is encrypted with it. After the third-party identity provider user authentication is successful, an authentication token (3P JWT) is generated. The user is authenticated using a Google JWT and third-party JWT. KACLS wraps the DEK with the key associated with the KACLS endpoint URL and returns a wrapped key. The encrypted data with its wrapped key is uploaded to the Google Workspace server.

Encrypting Files on Google Drive

To create an encrypted Google Docs document:

1. Open the **Google Drive** console, <https://drive.google.com>.
2. Log on as an end user.
3. Click **New > Google Docs > Blank encrypted document**.

A message prompting to sign in with your identity provider is displayed, as shown below.

4. Sign in with the configured third-party identity provider's user credentials.
5. Make your changes and save the document, as shown below.

The document is encrypted. KACLS' `wrap` API is called to encrypt the document. The `wrap` requests are logged at KACLS (under **Records > Server Records**), as shown below.

```

Encrypting Calls Over Google Meet

To initiate an encrypted Google Meet call:

1. Open the **Google Meet** console, <https://meet.google.com/>.
2. Log on as an end user.

3. Click **New meeting > Video call options > Security**.
4. Select **Add encryption**.

5. Create an encrypted call. The options are:

- Create a meeting for later
- Start an instant meeting

A message prompting to sign in with your identity provider is displayed, as shown below.

Sign in to join

You must sign in with <IDP> to join this encrypted call

Cancel **Sign in**

6. Sign in with the configured third-party identity provider's user credentials.

The call data is encrypted automatically with KACLS' **wrap** API. The **wrap** requests are logged at KACLS (under **Records > Server Records**), as shown below.

```
{
  "reason": "Client-side encryption for Google Meet",
  "authorization": {

    "email_verified": false
  }
}
```

Encrypting Google Calendar Events

To create an encrypted Google Calendar event:

1. Open the **Google Calendar** console, <https://calendar.google.com/>.
2. Log on as an end user.
3. Click **Create**.
4. Enable **Turn on encryption**. After selection, the option looks like the following.

5. Add event details.

A message prompting to sign in with your identity provider is displayed.

6. Sign in with the configured third-party identity provider's user credentials.

The event data is encrypted automatically with KACLS' `wrap` API. The `wrap` requests are logged at KACLS (under **Records** > **Server Records**), as shown below.

```
{
  "reason": "Encrypting description for calendar demo.user@domain.com, event 73

    "email_verified": true
  }
}
```

Encrypting Gmail Messages

When a user composes an encrypted Gmail message, the message will be encrypted by using the recipient's public key associated with the wrapped private key and certificates uploaded to Google. These were uploaded while completing the [additional prerequisites for Gmail](#).

After the third-party identity provider user authentication is successful, an authentication token (3P JWT) is generated. The user is authenticated using a Google JWT and third-party JWT. When the sender composes the message, KACLS unwraps the sender's wrapped private key, signs the message digest with this private key, and returns the signed digest. The encrypted Gmail message is uploaded to the Google Workspace server.

To compose an encrypted Gmail message:

1. Open the **Gmail** console, <https://mail.google.com/>.
2. Log on as an end user.
3. Click **Compose**.
4. Click the **Message security** icon and **Turn on** the encryption.

Decrypting Data Encryption Keys

When a user opens an encrypted document, joins an encrypted call, or views an encrypted Calendar event, the wrapped key and the encrypted data are downloaded from the Google Workspace server. Google JWT is generated by the Google Workspace CSE library. After the third-party identity provider user authentication is successful, an authentication token (3P JWT) is generated. The user is authenticated using a Google JWT and third-party JWT. KACLS unwraps the wrapped key and returns the DEK. Google Workspace CSE decrypts the data using this DEK.

Decrypting Files on Google Drive

To decrypt an encrypted Google Docs document:

1. Open the **Google Drive** console, <https://drive.google.com>.
2. Log on as a super admin for the user domain.
3. Try to open the encrypted document (created in [Encrypting Data Encryption Keys](#)).
4. Sign in with the configured third-party identity provider user credentials.

KACLS' **unwrap** API is called internally to decrypt the document for the user. The **unwrap** requests are logged at KACLS (under **Records > Server Records**), as shown below.

```
{
```

```

```

Decrypting Calls Over Google Meet

To decrypt an encrypted Google Meet call:

1. Open the **Google Meet** console, <https://meet.google.com/>.
2. Log on as an end user.
3. Join the call (created in [Encrypting Data Encryption Keys](#)).
4. Sign in with the configured third-party identity provider user credentials.

KACLS' **unwrap** API is called internally to decrypt the call for the user. The **unwrap** requests are logged at KACLS (under **Records > Server Records**), as shown below.

```

{
  "reason": "Client-side encryption for Google Meet",
  "authorization": {
    "aud": "cse-authorization",
    "exp": 1646761418,
    "iat": 1646757818,

    "email_verified": false
  }
}

```

Decrypting Google Calendar Events

To decrypt an encrypted Google Calendar event:

1. Open the **Google Calendar** console, <https://calendar.google.com/>.
2. Log on as an end user.
3. View the event (created in [Encrypting Data Encryption Keys](#)).
4. Sign in with the configured third-party identity provider user credentials.

KACLS' **unwrap** API is called internally to decrypt the event data for the user. The **unwrap** requests are logged at KACLS (under **Records > Server Records**), as shown below.

```

{
  "reason": "Decrypting description for calendar demo.user@domain.com, event 2c4nks2odk7nbk6nh0dpdhfn1p",

    "email_verified": true
  }
}

```

Decrypting Gmail Messages

When a recipient opens an encrypted Gmail message, the message will be decrypted by using the recipient's private key associated with the wrapped private key and certificates uploaded to Google. These were uploaded while completing the [additional prerequisites for Gmail](#).

After the third-party identity provider user authentication is successful, an authentication token (3P JWT) is generated. The user is authenticated using a Google JWT and third-party JWT. When the recipient opens the encrypted message, KACLS unwraps the recipient's wrapped private key, unwraps the encrypted content encryption key (ECEK) with this private key, and returns the message's DEK. Google Workspace CSE decrypts the message using this DEK.

To decrypt an encrypted Gmail message:

1. Open the **Gmail** console, <https://mail.google.com/>.
2. Log on as an end user.
3. Try to open the encrypted message.
4. Sign in with the configured third-party identity provider user credentials.

KACLS' `privatekeydecrypt` API is called internally to decrypt the message for the user. The `privatekeydecrypt` requests are logged at KACLS (under **Records** > **Server Records**), as shown below.

```

{
  "reason": "unpack request",
  "authorization": {
    "aud": "cse-authorization",
    "exp": 1661488112,

```

Endpoints

This section describes how to create, edit, disable/enable, archive, recover, and delete endpoints. Creation of an endpoint requires identity providers. At least one identity provider must be added to an endpoint. Identity providers can be created in advance or when creating the endpoints. This section assumes that you have already created identity providers, as described in [Creating Identity Providers](#).

Caution

Modify endpoints only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not modify the KEK using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the KEK unavailable to the Google Workspace CSE service.

Creating KACLS Endpoints

To create an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**. The Google Workspace Client Side Encryption page is displayed.
3. Click **Create Endpoint**. The Create Endpoint screen is displayed.
4. Specify a unique **Name** for the endpoint.
5. Specify the **Authentication Audience**.

Authentication Audience is the ID of the third-party identity provider. For example, for Auth0, it is represented by the **Client ID**.

6. (Optional) Switch the **Enable success audit events** toggle on or off to control the audit recording of success logs for the specified endpoint. By default, this toggle is set to active to troubleshoot performance issues.

Note

For improved performance, it is recommended to switch off the **Enable success audit events** toggle.

7. Specify the **Endpoint URL Hostname**. Enter the fully qualified domain name (FQDN) of the CCKM/ CipherTrust Manager appliance. Specify the hostname and port (`<hostname>:<port>`). If the port is not specified, **443** is the default port.
8. (Optional) Enable **Allow Guest Access**.

Note

The web interface port within CipherTrust Manager can be changed from the default port of **443** to another port. If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it **before** configuring the Google Workspace CSE service on CCKM. Also, reflect this port change when creating a KACLS endpoint on CCKM. Changing the default port **after** configuring Google Workspace CSE is not supported. Refer to [Support for Changing the Default Port of Web Interface Setting](#) for instructions on changing the port when configuring a Google Workspace CSE endpoint.

9. Select an **Identity Provider**. The options are:
 - **All**: This is the default option. All the available identity providers will be trusted by the endpoint.
 - **Selected**: Select this option to select/remove the desired identity providers.

Optionally, you can add a new identity provider by clicking **Create Identity Provider**. Refer to [Creating Identity Providers](#) for details.

10. Click **Save**.

The newly created endpoint appears in the endpoints list, with an Active status. Similarly, add as many endpoints as required.

Every endpoint has an associated endpoint URL. This URL is needed to access the Thales key service. Google Workspace administrators use this URL to configure Google Workspace to communicate with the KACLS.

Viewing Endpoints

The Google Workspace Client Side Encryption page shows the available endpoints. The **ENDPOINTS** section shows Name, Endpoint URL (or *KACLS URL*), Status, Key Name, Key ID, and Key Version.

To view details of an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**. The **ENDPOINTS** section shows the following details:

Column	Description
Name	Name of the endpoint.
Endpoint URL	(KACLS URL) URL of the endpoint. This URL is needed to access the Thales key service. Google Workspace administrators use this URL to configure Google Workspace to communicate with the KACLS.
Status	Status of the endpoint. The status can be: • Active: The endpoint is enabled. An endpoint is active when it is created, and can be disabled, archived, or deleted. • Disabled: The endpoint is disabled and cannot be used for encryption and decryption of data. A disabled endpoint can be enabled, archived, or deleted. • Archived: The endpoint is archived. An archived endpoint can be recovered later, if required.
Key Name	Name of the linked encryption key.
Key ID	ID of the linked encryption key. The ID changes on endpoint key rotation.
Key Version	Version of the encryption key. The key version changes on endpoint key rotation.

To view the perimeters of an endpoint, click the expand icon  to the left of the desired endpoint.

Viewing or Editing Endpoints

After an endpoint is created, you can view and modify the linked authentication audience, hostname for the endpoint URL, and identity provider.

To view and edit an endpoint details:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the endpoint you want to edit.

Note

The web interface port within CipherTrust Manager can be changed from the default port of 443 to

another port. If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it **before** configuring the Google Workspace CSE service on CCKM. Also, reflect this port change when creating a KACLS endpoint on CCKM. Changing the default port **after** configuring Google Workspace CSE is not supported. Refer to [Support for Changing the Default Port of Web Interface Setting](#) for instructions on changing the port when configuring a Google Workspace CSE endpoint.

4. Click **View/Edit**. The Edit Endpoint wizard is displayed.

5. (Optional) Make the necessary changes.

- Add or remove **Authentication Audience**.
- Update **Endpoint URL Hostname**.
- Enable **Allow Guest Access**.
- Update the **Identity Provider**.

You can also create a new identity provider by clicking **Create Identity Provider**. Refer to [Creating Identity Providers](#) for details.

6. Click **Save**.

The endpoint details are updated.

Rotating Endpoint Keys

Key rotation is process of changing an endpoint's existing key used to encrypt or decrypt the DEK.

To rotate encryption key for an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the desired endpoint.
4. Click **Rotate Keys**. A message appears prompting to confirm the action.
5. Click **Rotate Key**.

The endpoint key is rotated successfully.

Disabling Endpoints

When an endpoint is not needed for certain period of time, it can be disabled from the CipherTrust Manager.

Note

Before disabling the endpoint, ensure that it is not in use. If an in-use endpoint is disabled, Google Workspace cannot encrypt or decrypt content using the endpoint URL. Also, disabling an endpoint does not delete the associated encryption key.

To disable an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the endpoint you want to disable.
4. Click **Disable**.

The endpoint status becomes Disabled.

Enabling Endpoints

When a disabled endpoint is needed again, enable it from the CipherTrust Manager.

To enable an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the endpoint you want to enable.
4. Click **Enable**.

The endpoint status becomes Active.

Archiving Endpoints

Whenever needed, you can archive an endpoint from the CipherTrust Manager. An archived endpoint can be recovered later, if needed.

To archive an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the endpoint you want to archive.
4. Click **Archive**.

The endpoint status becomes Archived.

Recovering Archived Endpoints

An archived endpoint can be recovered from the CipherTrust Manager. A recovered endpoint can be used again to encrypt and decrypt data.

To recover an archived endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the archived endpoint you want to recover.
4. Click **Recover**.

The endpoint status becomes Active.

Deleting Endpoints

When an endpoint is no longer needed, delete it from the CipherTrust Manager.

Note

Before deleting the endpoint, ensure that it is not in use. If an in-use endpoint is deleted, Google Workspace cannot encrypt or decrypt content using the endpoint URL. Also, deleting an endpoint does not delete the associated encryption key.

To delete an endpoint:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **ENDPOINTS**, click the overflow icon  corresponding to the endpoint you want to delete.
4. Click **Delete**.

A warning message appears stating that the endpoint will be deleted permanently. Do you want to delete this endpoint?

5. Select **I wish to delete this endpoint**.
6. Click **Delete**.

The endpoint is removed from the endpoints list.

Identity Providers

This section describes how to create and delete identity providers. An identity provider authenticates the identities of users logging on to Google Drive to use Google Workspace CSE. It is verified using either an issuer or a JSON Web Key Set (JWKS). Identity providers are required when creating endpoints. Refer to [Creating Endpoints](#) for details.

Creating Identity Providers

An issuer or an openId configuration URL is required to create an identity provider.

To create an identity provider:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**. The Google Workspace Client Side Encryption page is displayed.
3. Under **IDENTITY PROVIDERS**, click **Create Identity Provider**. The Create Identity Provider screen is displayed.
4. Specify a unique **Name** for the provider. This is a mandatory field.
5. Select the **Provider Verifier**. This is a mandatory field.

The verifier can be:

- **Issuer:** Select and specify the valid **Issuer** and **jwksURL**. The **jwksURL** field is optional, and is populated automatically based on the specified issuer.
 - **OpenId Configuration URL:** Select and specify the **OpenId Configuration URL**. The URL must be valid. For example, when using SafeNet Trusted Access (STA) as an identity provider, the URL is represented by **WELL KNOWN CONFIGURATION URL** on the STA Management Console. Other supported identity providers are Auth0, Okta, and Google Identity Provider.
6. Click **Next**. The Confirm and Create screen is displayed.
 7. Verify the provider details. If the details are incorrect or you want to modify them, click **Back** and update the details.
 8. Click **Save**.

The newly created identity provider appears in the providers list. Similarly, add as many identity providers as required.

Viewing Identity Providers

The Google Workspace Client Side Encryption page shows the available identity providers. The **IDENTITY PROVIDERS** section shows the Name, Issuer, OpenID Configuration URL, and jwksURL.

To view identity providers:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Navigate to **IDENTITY PROVIDERS**. The list of identity providers is displayed.

The following details are shown:

Column	Description
Name	Name of the identity provider.
Issuer	Issuer string from the identity provider JWT.
OpenID Configuration URL	URL of the OpenID configuration.
jwksURL	URL of JWKS.

Deleting Identity Providers

When an identity provider is no longer needed, delete it from the CipherTrust Manager. Before deleting the provider, ensure that it is not in use by any endpoints.

To delete an identity provider:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **Services > Google Workspace CSE**.
3. Under **IDENTITY PROVIDERS**, click the overflow icon  corresponding to the provider you want to delete.
4. Click **Delete**.

A warning message appears stating that the provider will be deleted permanently. Do you want to delete this identity provider?

5. Select **I wish to delete this provider**.
6. Click **Delete**.

The identity provider is removed from the providers list.

Viewing Google Workspace CSE Records

This section describes the logs of Google Workspace events. Whenever an action is performed on an endpoint, an event is logged. The actions can be rotate keys, create endpoint, delete endpoint, wrap, unwrap, privileged-unwrap, private key sign, private key unwrap, and private key privileged-unwrap.

To view Google Workspace CSE events:

1. Open the **CipherTrust Manager** Application.
2. In the left pane, click **Records > Loki Audit Records**. The default **Server Records** tab shows the following details:

Column	Description
Status	Status of the event.
Event Created	Time when the event is created.
Severity	Severity of the event. The severity can be: • INFO • WARNING • ERROR • CRITICAL • FATAL
Message	Description of the event.
Service	Name of the service that logged the event.
Details	Details of the event.
Source	Hostname of the CipherTrust Manager.

Note

In some cases, you might see the following error:

```
invalid authorization token - cause: untrusted authentication token:
square/go-jose/jwt: validation field, token issued in the future (iat)
```

To resolve this issue, [add the Google NTP server to the CipherTrust Manager \(Admin Settings > NTPs\)](#).

Performance Summary

This section provides the performance summary of different Google Workspace CSE services managed through CCKM on the CipherTrust Manager server. The summary describes:

- What is the configuration (CPU, RAM, and Disk) of each server?
- Where are the clients located in relation to the servers?
- What are the minimum network requirements for reliable connectivity?
- How many requests per second (RPS) are handled in different scenarios?

Test Setup

This section describes the test environment in which the performance of the CCKM Google Workspace CSE service has been tested. The performance numbers provided in this section are based on this setup.

Note

Actual performance numbers in your environment can be different. The results can vary based on factors such as how and where the CipherTrust Manager is deployed, the CipherTrust Manager resources, the location of clients, the network connectivity, and how the traffic is load-balanced.

CipherTrust Manager

- Virtual CipherTrust Manager k170v deployed to
 - Google Cloud
 - Amazon Web Services (AWS)
- Physical Appliance k570

Client

k6 (an open-source load testing tool) is used as a client to simulate traffic between the Google Workspace CSE and the CipherTrust Manager.

The k6 client is deployed on the Google Cloud in the `us-central1-a` region.

Network Requirements

The following ports must be open for CipherTrust Manager/CCKM communication:

Type	Protocol	Port Range
SSH	TCP	22
HTTPS	TCP	443
PostgreSQL (for Cluster)	TCP	5432

Performance Numbers

Refer to the following sections for performance numbers, comparison graphs, and conclusion of performance for the Google services managed through CCKM on the CipherTrust Manager server.

- Google Calendar
- Google Drive
- Google Meet
- Gmail

Google Calendar

This section provides the performance summary of the Google Calendar service managed through CCKM on the CipherTrust Manager server.

Requests Per Second

The following sections list the wrap requests per second, approximate latency, and the number of virtual users for different deployment scenarios.

Note

To provide a good user experience, Google recommends a maximum latency of 200 ms (for 99% of the requests). Therefore, the performance numbers on this page are based on a latency of around 200 ms.

- Google Cloud
- AWS Cloud
- Physical Appliance

Google Cloud

Server Location	Client Location
us-central1-a	us-central1-a

Simulated the **wrap** requests for Google Calendar on the CipherTrust Manager deployed on Google Cloud Platform using the k6 tool. The following table shows the handled number of requests per second (RPS), with approximate latency, and the number of virtual users for different data samples on a standalone CipherTrust Manager and a two-node CipherTrust Manager cluster connected with a load balancer.

Click a tab to view performance numbers based on two different specifications.

Specification 1

System Volume	Memory	CPUs	NICs
50 GB	16 GB	4	1

Click a tab to view performance numbers for a standalone CipherTrust Manager or a two-node cluster with a load balancer.

Standalone

Users	Latency (in ms)	Requests/Second
10	22.16	16.94002
20	25.87	33.700992

Users	Latency (in ms)	Requests/Second
30	29.16	50.699

90	209.32	128.779991

Comparison Graphs

Physical Appliance vs AWS Cloud vs Google Cloud

Recommendations

Note

Editing a Google Calendar event results in one **wrap** request on every save.

Google Cloud

1. Response time compliance of around **200** ms was met for a maximum throughput of **131.69** operations per second with a standalone CipherTrust Manager k170v instance with **4** CPUs and **16** GB RAM.
2. Response time compliance of around **200** ms was met for a maximum throughput of **252.45** operations per second with a two-node CipherTrust Manager k170v cluster (each node with **4** CPUs and **16** GB RAM) connected with a Google Cloud load balancer.
3. Response time compliance of around **200** ms was met for a maximum throughput of **415.02** operations per second with a standalone CipherTrust Manager k470v instance with **8** CPUs and **64** GB RAM.
4. Response time compliance of around **200** ms was met for a maximum throughput of **749.70** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8** CPUs and **64** GB RAM) connected with a Google Cloud load balancer.

AWS Cloud

1. Response time compliance of around **200** ms was met for a maximum throughput of **242.47** operations per second with a standalone CipherTrust Manager k170v instance with **4** CPUs and **16** GB RAM.
2. Response time compliance of around **200** ms was met for a maximum throughput of **455.05** operations per second with a two-node CipherTrust Manager k170v cluster (each node with **4** CPUs and **16** GB RAM) connected with an AWS load balancer.
3. Response time compliance of around **200** ms was met for a maximum throughput of **524.96** operations per second with a standalone CipherTrust Manager k470v instance with **8** CPUs and **64** GB RAM.
4. Response time compliance of around **200** ms was met for a maximum throughput of **968.94** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8** CPUs and **64** GB RAM) connected with an AWS load balancer.

Conclusion

The number of users and throughput almost doubles up on moving from CipherTrust Manager k170v to k470v. Moreover, adding an additional node to the cluster also doubles up the throughput. Overall, a performance gain of 400 percent is achieved by moving from a standalone CipherTrust Manager k170v to a two-node CipherTrust Manager k470v cluster.

Google Drive

This section provides the performance summary of the Google Drive service managed through CCKM on the CipherTrust Manager server.

Requests Per Second

The following sections list the wrap requests per second, approximate latency, and the number of virtual users for different deployment scenarios.

Note

To provide a good user experience, Google recommends a maximum latency of 200 ms (for 99% of the requests). Therefore, the performance numbers on this page are based on a latency of around 200 ms.

Specification 2: Standalone vs Two-Node Cluster with Load Balancer

Physical Appliance

Server Location	Client Location
San Jose	us-central1-a

CipherTrust Manager Configuration

System Volume	Memory	CPUs	NICs
2 TB	16 GB	1 with 4 Cores	1

Simulated the **wrap** requests for Google Drive on the CipherTrust Manager deployed on a physical appliance using the k6 tool. The following table shows the handled number of requests per second (RPS), with approximate latency, and the number of virtual users for different data sample for three runs.

Users	Latency (in ms)	Requests/Second
10	85.72	15.3
20	98.705	30.165
30	111.69	45.03
40	135.3	58.74
50	158.91	72.45
60	177.04	85.06
70	195.17	97.67
80	229.715	108.8

Users	Latency (in ms)	Requests/Second
90	264.26	119.93

Comparison Graphs

Physical Appliance vs AWS Cloud vs Google Cloud

Recommendations

Assumption

Each user has **3** documents open and is editing them resulting in an autosave every **30** seconds, that is, **3/30=0.1** transactions per second (tps) per user.

Number of users = (throughput for around 200 ms latency)/0.1

Google Cloud

1. Response time compliance of around **200** ms was met for a maximum throughput of **112.54** operations per second with a standalone CipherTrust Manager k170v instance with **4** CPUs and **16** GB RAM.

The approximate number of users this configuration can handle is **1125**.

2. Response time compliance of around **200** ms was met for a maximum throughput of **198.03** operations per second with a two-node CipherTrust Manager k170v cluster (each node with **4** CPUs and **16** GB RAM) connected with a Google Cloud load balancer.

The approximate number of users this configuration can handle is **1980**.

3. Response time compliance of around **200** ms was met for a maximum throughput of **231.91** operations per second with a standalone CipherTrust Manager k470v instance with **8** CPUs and **64** GB RAM.

The approximate number of users this configuration can handle is **2319**.

4. Response time compliance of around **200** ms was met for a maximum throughput of **459.62** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8** CPUs and **64** GB RAM) connected with a Google Cloud load balancer.

The approximate number of users this configuration can handle is **4596**.

AWS Cloud

1. Response time compliance of around **200** ms was met for a maximum throughput of **159.96** operations per second with a standalone CipherTrust Manager k170v instance with **4** CPUs and **16** GB RAM.

The approximate number of users this configuration can handle is **1600**.

2. Response time compliance of around **200** ms was met for a maximum throughput of **304.81** operations per second with a two-node CipherTrust Manager k170v cluster (each node with **4** CPUs and **16** GB RAM) connected with an AWS load balancer.

The approximate number of users this configuration can handle is **3048**.

3. Response time compliance of around **200** ms was met for a maximum throughput of **324.27** operations per second with a standalone CipherTrust Manager k470v instance with **8** CPUs and **64** GB RAM.

The approximate number of users this configuration can handle is **3243**.

4. Response time compliance of around **200** ms was met for a maximum throughput of **629.58** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8** CPUs and **64** GB RAM) connected with an AWS load balancer.

The approximate number of users this configuration can handle is **6296**.

Conclusion

The number of users and throughput almost doubles up on moving from CipherTrust Manager k170v to k470v. Moreover, adding an additional node to the cluster also doubles up the throughput. Overall, a performance gain of 400 percent is achieved by moving from a standalone CipherTrust Manager k170v to a two-node CipherTrust Manager k470v cluster.

Google Meet

This section provides the performance summary of the Google Meet service managed through CCKM on the CipherTrust Manager server.

Requests Per Second

The following sections list the wrap requests per second, approximate latency, and the number of virtual users for different deployment scenarios.

Note

To provide a good user experience, Google recommends a maximum latency of 200 ms (for 99% of the requests). Therefore, the performance numbers on this page are based on a latency of around 200 ms.

Physical Appliance vs AWS Cloud vs Google Cloud

Recommendations

Note

When an encrypted Google Meet call is started, a **wrap** request is initiated. Similarly, when a participant joins the call, an **unwrap** request is initiated.

Google Cloud

1. Response time compliance of around **200 ms** was met for a maximum throughput of **144.66** operations per second with a standalone CipherTrust Manager k170v instance with **4 CPUs** and **16 GB RAM**.
2. Response time compliance of around **200 ms** was met for a maximum throughput of **279.02** operations per second with a two-node CipherTrust Manager k170v cluster (each node with **4 CPUs** and **16 GB RAM**) connected with a Google Cloud load balancer.
3. Response time compliance of around **200 ms** was met for a maximum throughput of **330.899** operations per second with a standalone CipherTrust Manager k470v instance with **8 CPUs** and **64 GB RAM**.
4. Response time compliance of around **200 ms** was met for a maximum throughput of **755.37** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8 CPUs** and **64 GB RAM**) connected with a Google Cloud load balancer.

AWS Cloud

1. Response time compliance of around **200 ms** was met for a maximum throughput of **252.19** operations per second with a standalone CipherTrust Manager k170v instance with **4 CPUs** and **16 GB RAM**.
2. Response time compliance of around **200 ms** was met for a maximum throughput of **442.50** operations per second with a two-node CipherTrust Manager k170v cluster (each node with **4 CPUs** and **16 GB RAM**) connected with an AWS load balancer.
3. Response time compliance of around **200 ms** was met for a maximum throughput of **559.30** operations per second with a standalone CipherTrust Manager k470v instance with **8 CPUs** and **64 GB RAM**.
4. Response time compliance of around **200 ms** was met for a maximum throughput of **1059.78** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8 CPUs** and **64 GB RAM**) connected with an AWS load balancer.

Conclusion

The number of users and throughput almost doubles up on moving from CipherTrust Manager k170v to k470v. Moreover, adding an additional node to the cluster also doubles up the throughput. Overall, a performance gain of 400 percent is achieved by moving from a standalone CipherTrust Manager k170v to a two-node CipherTrust Manager k470v cluster.

Gmail

This section provides the performance summary of the Gmail service managed through CCKM on the CipherTrust Manager server.

Requests Per Second

Note

To provide a good user experience, Google recommends a maximum latency of 200 ms (for 99% of the requests). Therefore, the performance numbers on this page are based on a latency of around 200 ms.

Google Cloud

Server Location	Client Location
us-central1-a	us-central1-a

Simulated the **wrap** requests for Gmail on the CipherTrust Manager deployed on Google Cloud Platform using the k6 tool. The following table shows the handled number of requests per second (RPS), with approximate latency, and the number of virtual users for different data samples on a standalone CipherTrust Manager and a two-node CipherTrust Manager cluster connected with a load balancer.

Click a tab to view performance numbers based on two different specifications.

Specification 1

System Volume	Memory	CPUs	NICs
50 GB	16 GB	4	1

Click a tab to view performance numbers for a standalone CipherTrust Manager or a two-node cluster with a load balancer.

Standalone

Users	Latency (in ms)	Requests/Second
8	112.82	94.06
10	142.63	91.29
12	164.78	95.53
14	186.13	95.50
16	217.41	97.64
18	235.36	97.06
20	280.78	94.99

Two-Node Cluster with Load Balancer

Users	Latency (in ms)	Requests/Second
4	41.35	113.23
8	57.45	169.3
12	81.86	185.09
16	123.85	187.64
20	165.34	182.57
24	175.80	191.29
28	207.44	192.54
30	200.4	192.48

Comparison Graphs

Specification 1: Standalone vs Two-Node Cluster with Load Balancer

Specification 2

System Volume	Memory	CPUs	NICs
50 GB	64 GB	8	1

Click a tab to view performance numbers for a standalone CipherTrust Manager or a two-node cluster with a load balancer.

Standalone

Users	Latency (in ms)	Requests/Second
5	37.74	137.78
10	58.68	188.84
15	92.87	198.14
20	124.35	206.45
25	163.84	201.55
30	192.61	204.03
35	223.67	207.56

Two-Node Cluster with Load Balancer

Users	Latency (in ms)	Requests/Second
10	37.39	281.74
20	75.83	355.52
30	99.86	394.25
40	127.73	412.16
50	164.73	408.12
60	194.85	412.00
70	223.14	415.12

Comparison Graphs

Specification 2: Standalone vs Two-Node Cluster with Load Balancer

Throughput Configuration

Recommendations

Note

When an encrypted email is sent, a **wrap** request is initiated. Similarly, when a participant opens the email, an **unwrap** request is initiated.

Google Cloud

1. Response time compliance of around **200 ms** was met for a maximum throughput of **97.64** operations per second with a standalone CipherTrust Manager k170v instance with **4 CPUs** and **16 GB RAM**.
2. Response time compliance of around **200 ms** was met for a maximum throughput of **192.48** operations per

second with a two-node CipherTrust Manager k170v cluster (each node with **4** CPUs and **16** GB RAM) connected with a Google Cloud load balancer.

- Response time compliance of around **200** ms was met for a maximum throughput of **207.56** operations per second with a standalone CipherTrust Manager k470v instance with **8** CPUs and **64** GB RAM.
- Response time compliance of around **200** ms was met for a maximum throughput of **415.12** operations per second with a two-node CipherTrust Manager k470v cluster (each node with **8** CPUs and **64** GB RAM) connected with a Google Cloud load balancer.

Conclusion

The number of users and throughput almost doubles up on moving from CipherTrust Manager k170v to k470v. Moreover, adding an additional node to the cluster also doubles up the throughput. Overall, a performance gain of 400 percent is achieved by moving from a standalone CipherTrust Manager k170v to a two-node CipherTrust Manager k470v cluster.

Key Material Export and Upload

This section describes how to prevent CCKM users from exporting source key material. The section also describes how to allow CCKM users other than key owners to upload source key material to the cloud.

Preventing CCKM Users from Exporting Key Material

When a CCKM user creates a new source key on the CipherTrust Manager and uploads it to the cloud, then, as a key owner, the CCKM user has all permissions on the source key. So, the CCKM user can export the source key material after upload.

To prevent the CCKM user from exporting the source key material:

- Create a custom group, for example, `<deny-export-policy-group>`. This group will be denied permission to export the source key material through a policy.

```
POST /api/v1/usermgmt/groups
{
  "name": "<deny-export-policy-group>"
}
```

- Create a policy, for example, `<deny-export-policy>` to deny the source key export.

```
POST /api/v1/admin/policies
{
  "name": "<deny-export-policy>",
  "allow": true,
  "effect": "deny",
  "actions": [
```

```

    "ExportKey"
  ]
}

```

3. Attach the policy, for example, `<deny-export-policy>` to the custom group.

```

POST /api/v1/admin/policy-attachments
{
  "policy": "<deny-export-policy>",
  "principalSelector": {
    "cust": {
      "groups": [
        "<deny-export-policy-group>"
      ]
    }
  }
}

```

4. Add the CCKM user, `<cckm-user>`, to the custom group.

```

POST /api/v1/usermgmt/groups/<deny-export-policy-group>/users/<cckm-user>
{
  "name": "<deny-export-policy-group>",
  "created_at": "<timestamp>",
  "updated_at": "<timestamp>"
}

```

The CCKM user can no longer export the key material.

Permitting CCKM Users to Upload Key Material

When the CCKM user is not the key owner, grant the read key and export/upload key permission on the source key to the CCKM Users group or the custom group.

```

PATCH /api/v1/vault/keys2/<key-id>
{
  "meta": {
    "ownerId": "<owner-ID>",
    "permissions": {
      "ReadKey": [
        "<group-name>"
      ],
      "UploadKey": [
        "<group-name>"
      ]
    }
  }
}

```

```
}
}
```

The CCKM user can upload the source key material successfully.

Luna HSM Resources

This section describes prerequisites to manage Luna HSM resources on CCKM.

Note

The information presented in this section also applies to Azure Dedicated HSM.

Luna Network HSM Compatibility

We have tested specific combinations of Luna 7.x firmware and Luna 7.x software. Consult [Luna Network HSM Customer Release Notes](#) for the current FIPS certified Luna firmware versions.

Appliance Software	HSM firmware
7.2	7.2.0
7.2	7.0.3
7.3	7.3.3
7.4	7.4.0
7.4	7.3.3
7.7.0	7.7.0
7.7.0	7.3.3
7.7.1	7.7.1
7.8.4	7.8.4
7.9.0	7.9.0

Note

- The above compatibilities apply for connections using the default Network Trust Link (NTLS) between the CipherTrust Manager and the Luna Network HSM. Secure Trusted Channel (STC) connections are only supported for HSM firmware version 7.7.0. or higher.
- The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

This release supports the following Luna HSM features:

- PED and Password-based HSM configurations.
- Both V0 and V1 partitions.
- Import of RSA-4096 keys from Luna Network HSM Software and Firmware versions 7.4.x and higher.
- Symmetric and asymmetric keys.

Prerequisites

Note

- Depending on the use case, the Luna HSM partitions can be configured in the Key Export or Clone mode. For AWS HYOK operations, you can configure the partitions in either mode. For BYOK operations, the partitions must be configured in the Key Export mode.
- If the Luna HSM partitions are configured in Clone mode but the connection manager is configured in Key Export mode, the key is created on the primary partition but you receive a wrap key error.
- If the Luna HSM partitions are configured in Export mode but the connection manager is configured in Clone mode, the key is created with an error. The public key will be present on all partitions, but the private key will only be present on the primary partition.

Before proceeding:

- Make sure that a common cipher is enabled on the Luna HSM and the CipherTrust Manager to allow successful connection between them.
- On Luna HSM, disable the HSM NTLS IP check by running the `ntls ipcheck disable` command.

Also, make sure the CipherTrust Manager is registered with the Luna HSM, as described below:

On the Luna HSM

1. Create a Client. Refer to [Luna HSM Client Software Installation](#).

The client certificate needed when creating the *client* on the Luna HSM can be downloaded by clicking **Download Luna Client Cert** on the CipherTrust Manager GUI. When uploading the certificate file to the Luna HSM, the file must have the same name as the internally generated CN. You can use `openssl` (or some other tool) to inspect the certificate CN. The name will look similar to `cckm-client-c2b39a4b-0f02-4be8-b37f-f3cadfc3ac11`.

2. Register the Client with the Luna HSM. Refer to [Multi-Step NTLS Connection Procedure](#).

-
3. Assign a Partition to the Client. Refer to [Client Partition Connections](#).

On the CipherTrust Manager

1. Add the Luna HSM Server to the CipherTrust Manager. Refer to [Adding an Internal Connection \(Server\)](#) under [Connection Manager](#).
2. Add Connection to the Luna HSM Server on the CipherTrust Manager. Refer to [Creating a Luna Connection](#).
3. Test the Connection. Refer to [Testing a New Luna Connection](#). Make sure the "connection_status" is `connection ok`.

The connection test can fail if:

- CipherTrust Manager is not successfully authenticated to the Luna HSM device
- NTLS service is down on the Luna HSM Server
- Luna HSM partition is not assigned to a Luna HSM client

Inspect the logs on the Luna HSM for details.

Now, [Luna HSM partitions](#) and [Luna HSM keys](#) can be managed on the CipherTrust Manager.

Managing Luna HSM Partitions

This section describes how to manage Luna HSM partitions on CCKM.

Before proceeding, make sure to fulfill [prerequisites](#).

Adding Luna HSM Partitions

Warning

Thales strongly discourages adding an Luna HSM partition that contains the CipherTrust Manager's root of trust (RoT) key to CCKM. Do not add a connection to a Luna HSM root-of-trust partition with Connection Manager.

To add a Luna HSM partition to CCKM:

1. Log on to the **CipherTrust Manager** GUI as administrator.
 2. Open the **Cloud Key Manager** application.
 3. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page is displayed.
 4. Click **Add Partition**. The Add Existing Partition page is displayed.
-

5. From the **Select Connection** drop-down list, select the desired connection.
6. Click **Add**.

The Luna HSM partition is added to CCKM.

A message **partition added successfully...** is displayed on the screen.

Refreshing Luna HSM Keys

Refreshing is the process of downloading keys created on the Luna HSM partitions to CCKM. Refresh can be achieved using any of the following ways:

- [Refreshing Specific Partitions](#)
- [Refreshing All Partitions](#)

Refreshing Specific Partitions

To refresh a specific partition:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page is displayed. This page displays the list of Luna HSM partitions.
3. Click the overflow icon () corresponding to the desired Luna HSM partition and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen.

After successful refresh, the refreshed keys are listed on the **Cloud Keys > Luna > Luna Keys** page. Refer to [Viewing Luna HSM Keys](#) for details.

Refreshing All Partitions

To refresh all Luna HSM partitions:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page is displayed. This page displays the list of Luna HSM partitions.
3. Click **Refresh All**. The "This may take a while..." message is displayed.

Note

Refreshing all Luna HSM partitions is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Luna > Luna Keys** page. Refer to [Viewing Luna HSM Keys](#) for details.

Syncing All Partitions

Syncing is the process of synchronizing keys in Luna HSM partitions. After successful sync, the partitions have the synced Luna HSM keys. Syncing is useful for Luna HSM partitions in the High Availability (HA) mode.

To synchronize all Luna HSM partitions:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page is displayed. This page displays the list of Luna HSM partitions.
3. Click **Sync All**. The "This may take a while..." message is displayed.

Note

Synchronizing all Luna HSM partitions is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Sync All** to continue.

A message **Sync started...** is displayed on the screen. To cancel the sync, click **Cancel Sync**.

The synchronized keys are listed on the **Cloud Keys > Luna > Luna Keys** page. Refer to [Viewing Luna HSM Keys](#) for details.

Viewing/Editing Details of Luna HSM Partitions

The Luna HSM Partitions page shows the list of existing Luna HSM partitions. Search for partitions by Partition ID, Connection, or Label.

Viewing Luna HSM Partitions Details

To view the details of Luna HSM partitions:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page displays the following details.

Column	Description
Partition ID	ID of the partition. Click the link to view more details about the partition.
Label	Label of the Luna HSM partition.
Firmware	Firmware running on the Luna HSM partition.
HA Enabled	Whether high availability (HA) is enabled (✓) on the Luna HSM partition. For partitions that do not have HA enabled, ✗ is displayed.
Connection	Name of the connection.
Last Refreshed	When the partition was last refreshed. Never is displayed for partitions that are never refreshed.
Model	Model of the Luna HSM partition. By default, this column is not visible. Click the Customize View (⚙️) icon, select Model , and click OK to display the column.

Note

The **Label** and **Firmware** details will be visible only after the linked Luna HSM connection is in **Ready** state after performing Test Connection (on the CipherTrust Manager GUI).

Modifying Luna HSM Partition Details

To modify the details of a Luna HSM partition:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page displays the list of added Luna HSM partitions.
3. Click the overflow icon (⋮) corresponding to the desired Luna HSM partition and click **View/Edit Details**.

You can change the Luna HSM connection and modify user/group permissions on the Luna HSM partition. For details, refer to:

- [Changing the Luna HSM Connection](#)
- [Managing User Permissions on Luna HSM Partitions](#)

Changing the Luna HSM Connection

To change the Luna HSM connection:

1. Expand **Connection**.
2. From the **Connection ID** drop-down list, select the desired Luna HSM connection.
3. Click **Update**.

A message **Updated connection for this partition** is displayed on the screen.

Managing User Permissions on Luna HSM Partitions

To work with Luna HSM, users/groups must have the minimum set of permissions that allow them to use the Luna HSM resources such as Luna HSM keys and partitions. Initially, the user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on the Luna HSM partition.

To add permission for a user/group:

1. In the **Access Control** section, click **Assign User/Group**.
2. On the **Assign User/Group** screen, select the user or group to be assigned permissions from the **User/Group** drop-down list.
3. Click **Save**.

The newly added user/group is displayed under **Name** in the **Access Control** section.

CCKM allows the following operations on the Luna HSM partitions:

- View Keys, Create Key, Edit Key, Sync Key, and Delete Key
- Refresh Partition, Sync Partition
- Unassign

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. Select the check box under the desired operation corresponding to the desired users or groups.
 2. Click **Update**.
-

A message **Updated access control for this partition** is displayed on the screen.

Removing a Permission

To remove a permission assigned to a user or group:

1. Clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A message **Updated access control for this partition** is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. Under **Unassign**, click the **X** button corresponding to the desired user/group.
2. On the **Unassign User / Unassign Group** screen, click **Unassign**.

Note

Unassigning this user/group will remove all permissions currently assigned to the user/group. Are you sure you want to continue?

3. Click **Unassign**.

A message **Updated access control for this key partition** is displayed on the screen.

Deleting Luna HSM Partitions

To delete a Luna HSM partition:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Luna HSM Partitions**. The Luna HSM Partitions page displays the list of added Luna HSM partitions.
3. Click the overflow icon () corresponding to the desired Luna HSM partition and click **Delete**.
4. On the **Delete Luna HSM Partition** screen, select **I wish to delete this partition**.
5. Click **Delete Partition**.

A message **Luna HSM partition deleted** is displayed on the screen.

Warning

The deleted partition's keys will no longer be available on the Luna Keys page, but the keys will still exist on the Luna HSM. If you later add this partition with the same ID, the keys will be available again.

Managing Luna HSM Keys

This section describes how to manage Luna HSM keys on CCKM. Before proceeding, you must have a Luna HSM partition added to the CCKM. Refer to [Managing Luna HSM Partitions](#) for details.

Note

CCKM supports replication of RSA keys in the High Availability (HA) mode for Luna HSM partitions configured in the Key Export mode.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Adding Luna HSM Keys

To add a Luna HSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Luna**. The list of available Luna HSM keys is displayed.
3. Click **Add Key**. The Add Luna Key dialog box is displayed.

Add Luna Key

1. **Select Key Type**, either **Symmetric** or **Asymmetric**.
2. Select the **Partition ID** of the desired Luna HSM.
3. Specify a **Key Label**. This helps in uniquely identifying a key.
4. Select the **Mechanism**. The supported key mechanisms are:

Symmetric

- CKM_AES_KEY_GEN

Asymmetric

- CKM_RSA_FIPS_186_3_AUX_PRIME_KEY_PAIR_GEN
- CKM_RSA_X9_31_KEY_PAIR_GEN
- CKM_RSA_FIPS_186_3_PRIME_KEY_PAIR_GEN
- CKM_RSA_PKCS_KEY_PAIR_GEN
- CKM_EC_KEY_PAIR_GEN

5. Select the **Key Size**. The supported sizes are:

- 2048, 3072, and 4096 for asymmetric keys
- 128, 192, and 256 for symmetric keys

6. (Applicable to the **CKM_EC_KEY_PAIR_GEN** mechanism) Select the **Elliptic Curve**.

- Click **Select**. The Select Luna Curve dialog box is displayed.
- Select the desired **Luna Curve**.
- Click **Select**.

Note

When **HSM policy 12:Allow non-FIPS algorithms** is disabled (FIPS mode):

- Curves with a length of 224 bits or greater can be used for all operations
- Curves ≥ 160 -bits and < 224 -bits can be used for signature verification only
- Curves less than 160-bits are not permitted

These restrictions comply with the recommendations in NIST SP 800-131A Rev2.

7. Selecting the **Key Attributes**.

You can select a set of key attributes. The options are **BYOK Compatible**, **AWS HYOK Compatible**, and **OCI HYOK Compatible**.

You can also select the key attributes. The options are:

- Modifiable, Extractable, Sensitive

- Encrypt, Decrypt, Wrap, Unwrap
- Sign, Verify, Derive

Note

- BYOK Compatible attributes are Modifiable, Extractable, and Sensitive. They apply to symmetric and asymmetric keys.
- AWS HYOK Compatible attributes are Sensitive, Encrypt, Decrypt, Wrap, and Unwrap. Ensure that the Modifiable and Extractable check boxes are clear. AWS HYOK Compatible applies to symmetric keys.
- OCI HYOK Compatible attributes are Sensitive, Encrypt, and Decrypt. Ensure that the Extractable check box is clear. OCI HYOK Compatible applies to symmetric keys.

8. Click **Next**.

Review And Add Key

This screen shows the key details that you have provided. Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the LUNA HSM KEY section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the Key ID link is displayed, the key is created successfully.

3. Click **OK**. The Add Luna Key wizard is closed.

The newly created key is displayed in the list of Luna keys.

Note

Creation of a Luna HSM key fails if:

- The selected Luna HSM partition is full. If the key creation fails, ensure enough free disk space is available on the partition and retry the key creation.

- The Luna HSM user credentials are incorrect or the password has expired. Check the credentials or reset the user password, as appropriate, test the connection, and retry the key creation.

Viewing Luna HSM Keys

The Luna Keys page displays the available Luna HSM keys. Search for Luna HSM keys by Key ID, Label, or Partition Label.

To view a Luna HSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Luna**. The Luna Keys page displays following details:

Field	Description
Key ID	Unique ID of the Luna HSM key. Click to view details and edit keys. Refer to Viewing or Editing Luna HSM Keys for details.
Label	Label of the Luna HSM key.
Status	Status of the Luna HSM key. The status can be: • Available • In Progress • Deleted • Failed
Class	Class of the Luna HSM key. The class can be: • Private Key • Public Key • Symmetric Key
Algorithm	Type of the Luna HSM key - RSA, AES, or EC.
Detection Date	Time when the key is added to CCKM.
Partition Label	Label of the Luna HSM partition where the key is created.
Synced	Whether the key is synchronized (✓). For keys that are not synced, ✗ is displayed.

To hide/display columns, click the Customize View (⚙️) icon, select or clear the desired check boxes, and click **OK**.

Viewing or Editing Luna HSM Keys

The Luna Keys page displays the list of available keys with their details. After a key is created, you can change its attributes. However, the key mechanism and size cannot be modified.

To edit a Luna HSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Luna**. The list of available Luna HSM keys is displayed.
3. Click the **Key ID** link of the desired key. The edit view of the Luna Keys page is displayed. The mini detail view displays the key details, including a link to its private/public key.

Alternatively, click the overflow icon () corresponding to the desired key and click **View/Edit**.

4. Under the GENERAL INFO section, modify the desired **Key Attributes**.
5. Click **Update**.

The message **Updating Key is in progress** is displayed. It may take some time to reflect the changes.

Refreshing Luna HSM Keys

Refreshing is the process of downloading keys from configured Luna HSM partitions and updating their details on the CCKM GUI. You can refresh keys of all partitions at once.

To refresh keys of all partitions:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Luna**. The list of available Luna HSM keys is displayed.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refreshing all Luna HSM Partitions is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Luna > Luna Keys** page.

Syncing Luna HSM Keys

Syncing is the process of synchronizing a key in all Luna HSM partitions. After successful sync, all the partitions have the synced Luna HSM key. Syncing is useful for Luna HSM partitions in the HA mode.

To sync individual keys in all partitions:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Luna**. The list of available Luna HSM keys is displayed.
3. Click the overflow icon () corresponding to the desired key and click **Sync**.

A message **Sync started...** is displayed on the screen. If you want to cancel the sync, click **Cancel Sync**.

The synced key is listed on the **Cloud Keys > Luna > Luna Keys** page. The synced key will be visible under all the partitions.

Deleting Luna HSM Keys

To delete a Luna HSM key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Luna**. The list of available Luna HSM keys is displayed.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Delete**. The Delete Key dialog box is displayed.
5. Select **I wish to delete this key**.
6. Click **Delete**.

A success message **Delete is in progress** is displayed. It may take some time to reflect the changes. After a key is deleted, its status becomes **DeLeted** on the Luna Keys page.

Scheduling Operations

CCKM allows you to periodically refresh keys in the background. To refresh keys, you need to create schedule configuration. A schedule configuration defines when to run a refresh job. You can use either basic format or cron format to specify the time when the refresh job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- **Repeats**: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- **at**: specific time at which the refresh operation will be performed. Possible value lies between 12:00-11:00 AM/

PM UTC.

Specify cron format in the following order:

" * * * * * "

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Refresh Schedule

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. Under Select Schedule Type, select **Key Refresh**.
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Luna HSM** from the **Cloud Name** drop-down list.
 - (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the following values:
 - **Schedule Starts**

▪ Schedule Ends

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will refresh keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
- c. Click **Next**.

8. On the **Add Partitions** screen:

- a. Select the partition name from the **Refresh Keys from Selected Partition(s)** drop-down list.
- b. Click **+** button.

Similarly, you can add more partitions.

- c. Select the **Refresh All Partitions** option if you want to refresh all the existing partitions.
- d. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only) For Luna HSM, only Key Refresh is supported.
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Creation time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration.

Field	Description
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

4. Edit or configure the following fields and click **Update**:

- Description.
- Status of the scheduler configuration.
- Scheduler configuration parameters such as duration, frequency, and expiry time of the key.

The Schedules page also contains a section named **JOB HISTORY** that contains all the related information about a schedule such as **Run Date**, **Job ID**, **Status**, and **Errors**.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Oracle Cloud Resources

Oracle Cloud Infrastructure (OCI) resources include vaults and keys. Manage OCI keys stored in vaults linked to your OCI accounts using CCKM.

Prerequisites

Before you can manage OCI resources on CCKM:

1. [Get an OCI Account](#)
2. [Create an OCI User Group](#)
3. [Apply Policies to the User Group](#)
4. [Create a User in the User Group](#)
5. [Create an OCI Vault](#)
6. [Create an API Key for the User](#)
7. [Add OCI Connection on CipherTrust Manager](#)

Click each link to view details.

Note

Currently, only commercial OCI regions are supported.

Get an OCI Account

Sign up with OCI. When signing up, you need to specify a name for your cloud account (referred to as *tenancy* in OCI) and OCI credentials (username and password). These are required to access the OCI resources.

Note

Steps on this page are documented for the username and password based authentication. If Single Sign-On (SSO) configured for your OCI accounts, steps to log on might differ.

To log on to OCI:

1. Open the Oracle Cloud Sign In page.
2. Enter your tenancy name in the **Cloud Account Name** field.
3. Click **Next**.
4. Enter your **User Name** and **Password**.
5. Click **Sign In**.

Access permissions on a compartment are controlled at the user group level. So, first of all, you need to add an OCI user group. Then, you can apply policy to this user group, and add new users to the group.

Create an OCI User Group

To create an OCI user group:

1. Open the navigation menu and click **Identity & Security**. The Identity & Security page is displayed.
2. Under **Identity**, click **Groups**.
3. Click **Create Group**. The Create Group dialog box is displayed.
4. Enter a unique **Name** for your group, for example, **cckm-group**.

Note

The name cannot contain spaces.

5. Enter a **Description** for your group.
6. Click **Create**.

The OCI group, **cckm-group** is created. Now, you can apply appropriate policies to this group to grant it permissions to manage vaults and keys in your compartments.

Apply Policies to the User Group

Create the policy to give your group (**cckm-group**, created above) permissions in your compartment.

1. Open the navigation menu and click **Identity & Security**. The Identity & Security page is displayed.
2. Under **Identity**, click **Policies**.
3. In the left, under **List Scope**, make sure that your compartment is selected. The Policies in **<your - compartment>** (root) *Compartment* page is displayed.
4. Click **Create Policy**. The Create Policy page displayed.
5. Enter a unique **Name** for your policy, for example, **cckm-policy**.

Note

The name cannot contain spaces.

6. Enter a **Description** for your policy.
7. In the **Policy Builder** section, click **Show manual editor**.
8. In the text field under **Policy Builder**, enter the following:

Syntax

```
Allow group <group-name> to manage vaults in compartment <compartment-name>
Allow group <group-name> to manage keys in compartment <compartment-name>
Allow group <group-name> to read audit-events in <location>
Allow group <group-name> to Inspect compartments IN TENANCY
```

These statements grant a user group the permissions to manage vaults and keys in the specified compartment.

Example

```
Allow group cckm-group to manage vaults in compartment cckm-compartment
Allow group cckm-group to manage keys in compartment cckm-compartment
Allow group cckm-group to read audit-events in us-ashburn-1
Allow group cckm-group to Inspect compartments IN TENANCY
```

These statements grant members of your user group (**cckm-group**) the access to manage vaults and keys in your compartment.

9. Click **Create**.

Create a User in the User Group

To create an OCI user:

1. Open the navigation menu and click **Identity & Security**. The Identity & Security page is displayed.
2. Under **Identity**, click **Users**. The Users page is displayed.
3. Click **Create User**. The Create User dialog box is displayed.
4. Enter a unique **Name** for the user, for example, **cckm-user**.

Note

The name cannot contain spaces.

5. Enter a **Description** for the user.
6. (Optional) Specify and confirm email of the user.
7. Click **Create**.

The OCI user, **cckm-user** is created and displayed on the Users page. Now, you can add this user to the user group you created earlier. The user will inherit the permissions granted to its user group.

To add the user to a group:

1. Click the **Name** link of your user. The user details are displayed.
2. Navigate to the **Groups** section.

3. Click **Add User to Group**. The Add User to Group dialog box is displayed.
4. From the Groups drop-down list, select the desired group (for example, **cckm-group**). The drop-down list shows the available user groups.
5. Click **Add**.

The OCI user, **cckm-user** is added to the selected user group. The user now inherits the permissions granted to the linked user group.

Create an OCI Vault

OCI keys reside inside vaults. Only the users of the group with permissions to manage vaults can create vaults.

To create an OCI vault:

1. Open the navigation menu.
2. Click **Identity & Security > Vault**.
3. In the left, under **List Scope**, in the **Compartment** list, click the name of the compartment where you want to create the vault.
4. Click **Create Vault**. The Create Vault dialog box is displayed.
5. Enter a display **Name** for the vault, for example, **cckm-vault**. Avoid entering confidential information.

Optionally, make the vault a virtual private vault by selecting the **Make it a virtual private vault** check box. For more information about vault types, refer to [Key and Secret Management Concepts](#).

Note

You cannot change the vault type after the vault is created.

6. If you have permissions to create a resource, then you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, refer to [Resource Tags](#). If you are not sure whether to apply tags, skip this option (you can apply tags later) or ask your administrator.
7. When you are finished, click **Create Vault**.

The newly created vault is displayed in the list of vaults.

Create an API Key for the User

Now, you need to create an API key for your user so that the user can add OCI connection and manage vaults and keys. When you create the key, you will get authentication information needed to add an OCI connection to

the CipherTrust Manager.

To add an API key for the user:

1. Open the navigation menu and click **Identity & Security**. The Identity & Security page is displayed.
2. Under **Identity**, click **Users**. The Users page is displayed.
3. Click the **Name** link of your user. The user details are displayed.

Alternatively, click the **Profile** icon in the top right corner, and click the user name link.

4. In the left pane, under **Resources**, click **API Keys**. The API Keys section is displayed under the user details.
5. In the **API Keys** section, click **Add API Key**. The Add API Key screen is displayed.

An API key is an RSA key pair in PEM format used for signing API requests. You can generate the key pair here and download the private key. If you already have a key pair, you can choose to upload or paste your public key file instead. In this section, you will generate a new API key pair.

6. Select **Generate API Key Pair**.
7. Click **Download Private Key**. A private key file is downloaded in the PEM format.
8. Click the **Download Public Key** link to download the associated public key.
9. Click **Add**. The Configuration File Preview dialog box is displayed.

This configuration file snippet includes the authentication information such as OCID of the user and tenancy, fingerprint, and region. You will need this information when adding an OCI connection to the CipherTrust Manager.

10. Click **Close** to close the screen.

The newly added API key is displayed under the API Keys section. To view the key details later, visit the API Keys section, click the overflow icon corresponding to the key, and click **View Configuration File**.

Add OCI Connection on CipherTrust Manager

Before you can add an Oracle vault to the CCKM, a connection to your OCI account must exist on the CipherTrust Manager. After you have created an API key for the user, add a connection to the OCI account.

A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connection Manager](#) for details.

What Next?

After completing the prerequisites, you can view linked Oracle vaults and manage keys on the CipherTrust Manager.

- [Managing Oracle Vaults](#)

-
- [Managing Oracle Keys](#)
 - [Managing Oracle Tenancies](#)
 - [Scheduling Operations](#)
 - [Managing Oracle Reports](#)
 - [Managing Oracle Compartments](#)
 - [Downloading Oracle Metadata](#)

Managing Oracle Vaults

This section describes how to manage Oracle vaults on CCKM. Before proceeding, a connection to your Oracle account must exist on the CipherTrust Manager. Refer to [Oracle Cloud Infrastructure \(OCI\)](#) for details.

After the connection is configured, you can add vaults to the CipherTrust Manager. Oracle vaults can be added, viewed, modified, or deleted on the Vaults tab of the Oracle Vaults page.

Adding Existing Oracle Vaults

You can add existing vaults linked to an Oracle connection to the CipherTrust Manager. An existing vault can only be added just once.

To add an existing Oracle vault:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**. The Vaults tab of the Oracle Vaults page is displayed.
3. Click **Add Existing Vault**. The Select Connection Information and Vaults screen of the Add Existing Vault wizard is displayed.

Select Connection Information and Vaults

Filter vaults based on Oracle compartments and then by regions.

1. **Select a Connection** from the drop-down list. The list of existing compartments linked with the selected connection is displayed.
2. **Select a Compartment** from the drop-down list. The list of regions where the selected compartment is available is displayed.
3. **Select Region** from the drop-down list. The list of key vaults in the selected region is displayed.
4. Under **Key Vault Name**, select the desired vaults.
5. Click **Next**. The Add Bucket Name, Bucket Namespace screen is displayed.

Add Bucket Name, Bucket Namespace

The bucket name and namespace are required for creating key backups of HSM-protected keys for Virtual Private Vaults. Without these parameters, the Key Backup functionality while syncing vaults will cease.

1. Specify the **Bucket Name**.
2. Specify the **Bucket Namespace**.
3. Click **Add**.

The selected vault is displayed on the Vaults tab of the Oracle Vaults page. Now, you can manage the vault from CCKM on the CipherTrust Manager.

The vault is available to [upload Oracle keys](#) and [view Oracle reports](#).

Viewing Oracle Vaults

The Vaults tab of the Oracle Vaults page shows the list of vaults added to the CipherTrust Manager. Search for the vaults by Vault Name, Tenant, or Compartment.

To view the list of vaults added to the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**. The Vaults tab of the Oracle Vaults page shows the list of vaults added to the CipherTrust Manager.

The page displays the following details:

Column	Description
Vault Name	Name of the vault.
Tenancy	Name of the Oracle tenancy.
Compartment	Name of the Oracle compartment.
Region	Region of the vault.
Virtual Private	Whether the vault is a Virtual Private vault.
State	State of the vault.
Connection	Name of the Oracle connection added to the CipherTrust Manager.
Last Refreshed	Date and time when the vault was refreshed the last.

To view/hide columns, click the Customize View () icon, select/clear the desired option, and click **OK** to display the column.

Refreshing Oracle Vaults

Refreshing is the process to download keys created in Oracle vaults to the CCKM. You can refresh keys from individual or all Oracle vaults.

- [Refreshing Specific Oracle Vaults](#)
- [Refreshing All Oracle Vaults](#)

The backup of Oracle keys is created only when the vaults are refreshed. The backup can only be created for keys that:

- Are stored in Virtual Private Vaults (VPVs)
- Are stored in vaults that have associated bucket credentials
- Have the HSM protection mode

Refreshing Specific Oracle Vaults

To refresh a vault:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. On the Vaults tab, click the overflow icon () corresponding to the desired vault and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Oracle > Oracle Keys** page. Refer to [Viewing Oracle Keys](#) for details.

Refreshing All Oracle Vaults

To refresh all Oracle vaults:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. On the Vaults tab, click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all vaults is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

-
4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Oracle > Oracle Keys** page. Refer to [Viewing Oracle Keys](#) for details.

Viewing Details of a Vault

To view the details of a vault on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. On the Vaults tab, click the **Name** link of the desired vault.

Alternatively, click the overflow icon () corresponding to the desired vault, and click **View/Edit Details**.

The edit view of the Oracle Vaults page shows additional details of the selected vault under the GENERAL INFO and ACCESS CONTROL sections. Expand each section to view more details.

The GENERAL INFO section provides details of linked Oracle connection, Bucket Name, and Bucket Namespace. If needed, you can modify these settings, as appropriate.

Changing the Oracle Connection

To change the Oracle connection of a vault:

1. Expand **GENERAL INFO**.
2. From the **Connection** drop-down list, select the desired Oracle connection.
3. Click **Update**.

The connection of the Oracle vault is changed.

Modifying the Bucket Details

To modify the bucket details of a vault:

1. Expand **GENERAL INFO**.
2. Update the **Bucket Name**.
3. Update the **Bucket Namespace**.
4. Click **Update**.

The bucket name and bucket namespace of the Oracle vault is modified.

Managing User Permissions on Oracle Vaults

To work with the Oracle cloud, users/groups must have the minimum set of permissions that allow them to use the Oracle resources such as keys and vaults. Initially, the CCKM user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on Oracle vaults.

Users with the following characteristics can perform operations for Oracle keys and vaults:

- Users in the **CCKM Admins** group
- Users in the **Admin** group
- Users who are administrators for a **domain**
- Users who are in the **CCKM Users** group and which have had a CCKM Admin assign permissions through the UI or the `/v1/cckm/oci/vaults/{id}/update-acls` endpoint in the REST API.

Adding Permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. On the Vaults tab, click the **Name** link of the desired vault.

Alternatively, click the overflow icon () corresponding to the desired vault, and click **View/Edit Details**.

4. Expand the **ACCESS CONTROL** section.
5. Click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
6. Select the desired user or group from the **User/Group** drop-down list.
7. Click **Save**.

The newly added user/group is displayed under **Name** in the **ACCESS CONTROL** section. You can now grant additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Allowed Operations

CCKM allows the following operations on Oracle vaults:

-
- View Keys, Add Native Key, Add BYOK Key, Edit Key
 - Rotate Key, Delete Key, Cancel Delete, Remove Key Backup, Remove Key
 - Rotate to Native Key, Rotate to BYOK Key, Refresh Key

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the ACCESS CONTROL section, select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a Permission

To remove a permission assigned to a user or group:

1. In the ACCESS CONTROL section, clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the ACCESS CONTROL section, under **Unassign**, click the **X** button corresponding to the desired user/group.
2. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

3. Click **Remove** to confirm the action. To cancel the action, click **Keep It**.

A success message is displayed on the screen.

Removing Oracle Vaults

Oracle vaults can be removed on the Oracle Vaults page. Search for existing vaults using Vault Name, Tenant, or Compartment.

To remove a vault from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. On the Vaults tab, click the overflow icon () corresponding to the vault you want to remove.
4. Click **Remove Vault**.
5. Select **I wish to delete the vault**.
6. Click **Delete**.

The Oracle vault is deleted successfully. The vault is removed from the list of Oracle vaults.

Managing Oracle Keys

This section describes how to manage Oracle keys on CCKM. Before proceeding, you must have an Oracle vault added to the CCKM. Refer to [Managing Oracle Vaults](#) for details.

- [Key Creation Methods and Sources](#)
- [Adding Key Material Using External \(BYOK\) Source](#)
- [Adding Key Material Using Oracle External \(HYOK\) Source](#)
- [Creating Native Key Material](#)
- [Viewing Oracle Keys](#)
- [Viewing Key Versions](#)
- [Viewing or Editing Details of Oracle Keys](#)
- [Refreshing Oracle Keys](#)
- [Disabling an Oracle Key](#)
- [Enabling an Oracle Key](#)
- [Moving Keys to Another Compartment](#)
- [Adding a Key Version](#)
- [Scheduling Deletion of a Key](#)

- [Canceling Deletion of a Key](#)
- [Removing a Key Backup](#)
- [Restoring a Deleted Key](#)

Key Creation Methods and Sources

Key material for new OCI keys can be added by:

- Creating and uploading a new source key, or by creating a new Oracle native key.
- Copying key material from an existing source key to create a new key.

For adding OCI keys, CCKM supports the following key material sources:

- **External (BYOK):** External (Bring Your Own Key). Add key material by creating or uploading new source key from an external source. Refer to [Adding Key Material Using External \(BYOK\) Source](#) for details. You can select CipherTrust Manager (External), CipherTrust Manager (Local), Luna HSM, or Vormetric (DSM) as an external key source.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- **Oracle External (HYOK):** External KMS (Hold Your Own Key). Add an HYOK key tied to key material stored in an external key vault. This option is available for external key vaults only. [Adding Key Material Using Oracle External \(HYOK\) Source](#) for details. You can select CipherTrust Manager (Local) as an external key source.
- **Oracle Native:** Create Oracle key material directly with native Oracle application. Refer to [Creating Native Key Material](#) for details.

Adding Key Material Using External (BYOK) Source

To add key material using external BYOK as a key source:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click **Add Key**. The Key Material Origin screen of the Add Oracle Key wizard is displayed.

Key Material Origin

1. Select **External (BYOK)** as the **Origin Type**. This is the default option.

2. Select the desired **Vault** from the drop-down list. The list shows available external and default vaults.
3. Select an **Oracle Compartment** from the drop-down list. The list shows the available compartments based on the selected vault. This field is mandatory for default vaults, and is read-only for external vaults.
4. Select the **Source**. The options are:
 - **CipherTrust (External)**: Add key by creating or uploading an external CipherTrust key as the source key. Refer to [Adding Key Using External CipherTrust as External \(BYOK\) Source](#) for details.
 - **CipherTrust (Local)**: Add key by creating or uploading a CipherTrust key as the source key. Refer to [Adding Key Using Local CipherTrust as External \(BYOK\) Source](#) for details.
 - **Luna HSM**: Add key by creating or uploading a Luna HSM key as the source key. Refer to [Adding Key Using Luna HSM as External \(BYOK\) Source](#) for details.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- **Vormetric DSM**: Add key by creating or uploading a Vormetric DSM key as the source key. Refer to [Adding Key Using Vormetric DSM as External \(BYOK\) Source](#) for details.

Adding Key Using External CipherTrust as External (BYOK) Source

To add a key by creating or uploading an external CipherTrust key as the source key:

Key Material Origin

1. Select **CipherTrust (External)** as the **Source**.
2. Click **Next**. The Configure CipherTrust (External) Key screen is displayed.

Configure CipherTrust (External) Key

1. Select the **Source Key Material**. This specifies how to create the key. The options are:
 - **Create New Key**: Click to create a fresh key.
 - a. **Select Domain** for the key. The drop-down list shows the domains of the external CipherTrust Manager linked with the configured connection.
 - b. Enter a **Key Name**.
 - c. Select the **Algorithm** from the available options. The supported algorithms are AES and RSA.

d. Select the **Key Size** from the available options.

- **Copy Existing Key:** Click to create a new key by copying an existing key. **Select Domain**, then select an existing **Key** from the drop-down list.

2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique, user-friendly alias as the **Oracle Key Name**. This will be the key name on Oracle cloud. This name helps uniquely identify an Oracle key.
2. Select the **Protection Mode**. The options are Software and HSM.
3. (Optional) Specify the tags.

To add a new tag:

a. Select a **Tag Namespace**. The options are:

- **Free Form:** Allows adding free form tags.
- **Oracle Tags:** Allows adding tags based on created on and created by.

b. Specify a **Tag Key**.

c. Specify a **Tag Value**.

d. Click **+**.

Similarly, add as many tags as required.

4. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and BYOK KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY section becomes Complete and the Key ID link is displayed, the

key is created successfully.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the list of Oracle keys.

Adding Key Using Local CipherTrust as External (BYOK) Source

To add a key by creating or uploading a CipherTrust key as the source key:

Key Material Origin

1. Select **CipherTrust (Local)** as the **Source**.
2. Click **Next**. The Configure CipherTrust (Local) Key screen is displayed.

Configure CipherTrust (Local) Key

1. Select the **Source Key Material**. This specifies how to create the key. The options are:
 - **Create New Key**: Click to create a fresh key.
 - a. Enter a **Key Name**.
 - b. Select the **Key Type** from the available options. The supported key types are AES and RSA.
 - c. Select the **Key Size** from the available options.
 - **Copy Existing Key**: Click to create a new key by copying an existing key. Select **Key Type**, **Key Size***, and an existing key from the CipherTrust Key Name** drop-down list.
2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique, user-friendly alias as the **Oracle Key Name**. This will be the key name on Oracle cloud. This name helps uniquely identify an Oracle key. By default, the Key Name you specified on the previous screen is populated.
2. Select the **Protection Mode**. The options are Software and HSM.
3. (Optional) Specify the tags.

To add a new tag:

- a. Select a **Tag Namespace**. The options are:
 - **Free Form**: Allows adding free form tags.
 - **Oracle Tags**: Allows adding tags based on created on and created by.
- b. Specify a **Tag Key**.

c. Specify a **Tag Value**.

d. Click **+**.

Similarly, add as many tags as required.

4. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and BYOK KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **NATIVE KEY** section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is complete.

When the status next to the BYOK KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the list of Oracle keys.

Adding Key Using Vormetric DSM as External (BYOK) Source

To add a key by creating or uploading a Vormetric DSM key as the source key:

Key Material Origin

1. Select **Vormetric DSM** as the **Source**.
2. Click **Next**. The Configure DSM Key screen is displayed.

Configure DSM Key

1. Select the **Source Key Material**. This specifies how to create the key. The options are:
 - **Create New Key**
 - a. Click to create a fresh key.
 - b. Specify the **DSM Key Name** for the new key.
 - c. (Optional) Add a **Description** for the new key.
-

-
- d. Select the desired **DSM Domain** for the key. This drop-down list shows the DSM domains based on the DSM connection added to the CipherTrust Manager.
 - e. Select the **Key Type** from the available options. The supported key types are AES and RSA.
 - f. Select the **Key Size** from the available options.
- **Copy Existing Key:** Click to create a new key by copying an existing key.
 - a. Select the **Key Type** from the available options. The supported key types are AES and RSA.
 - b. Select the **Key Size** from the available options.
 - c. Select an existing key from the **DSM Key Name** drop-down list. This field shows the available keys based on the DSM connection added to the CipherTrust Manager.
2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique, user-friendly alias as the **Oracle Key Name**. This will be the key name on Oracle cloud. This name helps uniquely identify an Oracle key. By default, the Key Name you specified on the previous screen is populated.
2. Select the **Protection Mode**. The options are Software and HSM.
3. (Optional) Specify the tags.

To add a new tag:

- a. Select a **Tag Namespace**. The options are:
 - **Free Form:** Allows adding free form tags.
 - **Oracle Tags:** Allows adding tags based on created on and created by.
- b. Specify a **Tag Key**.
- c. Specify a **Tag Value**.
- d. Click **+**.

Similarly, add as many tags as required.

4. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and BYOK KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **BYOK KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is complete.

When the status next to the SOURCE KEY and BYOK KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the list of Oracle keys.

Adding Key Using Luna HSM as External (BYOK) Source

To add a key by creating or uploading a Luna HSM key as the source key:

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Key Material Origin

1. Select **Luna HSM** as the **Source**.
2. Click **Next**. The Configure HSM Key screen is displayed.

Configure HSM Key

1. Select the **Source Key Material**. This specifies how to create the key. The options are:
 - **Create New Key**
 - a. Click to create a fresh key.
 - b. Select the desired **Partition ID** for the key. This drop-down list shows the Luna HSM partitions based on the Luna HSM connection added to the CipherTrust Manager. The new Luna HSM key will be created in this partition.
 - c. Specify the **HSM Key Name** for the new key.
 - d. Select the **Key Type** from the available options. The supported key types are AES and RSA.
 - e. Select the **Key Size** from the available options.

-
- f. Select a key **Mechanism** from the available options.
 - g. Select the **Key Attributes**. The options are:
 - Modifiable, Extractable, Sensitive (all *three* are selected for a **BYOK Compatible** key)
 - Encrypt, Decrypt, Wrap, Unwrap
 - Sign, Verify, Derive
 - **Copy Existing Key**: Click to create a new key by copying an existing key.
 - a. Select the **Key Type** from the available options. The supported key types are AES and RSA.
 - b. Select the **Key Size** from the available options.
 - c. Select an existing key from the **HSM Key Name** drop-down list. This field shows the available keys based on the Luna HSM connection added to the CipherTrust Manager.

2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique, user-friendly alias as the **Oracle Key Name**. This will be the key name on Oracle cloud. This name helps uniquely identify an Oracle key. By default, the Key Name you specified on the previous screen is populated.
2. Select the **Protection Mode**. The options are Software and HSM.
3. (Optional) Specify the tags.

To add a new tag:

- a. Select a **Tag Namespace**. The options are:
 - **Free Form**: Allows adding free form tags.
 - **Oracle Tags**: Allows adding tags based on created on and created by.
- b. Specify a **Tag Key**.
- c. Specify a **Tag Value**.
- d. Click **+**.

Similarly, add as many tags as required.

4. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN,

SOURCE KEY, and BYOK KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **BYOK KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is complete.

When the status next to the SOURCE KEY and BYOK KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the list of Oracle keys.

Adding Key Material Using Oracle External (HYOK) Source

To add key material using external Oracle HYOK as a key source:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click **Add Key**. The Key Material Origin screen of the Add Oracle Key wizard is displayed.

Key Material Origin

1. Select **Oracle External (HYOK)** as the **Origin Type**.
2. Select the external **Vault** from the drop-down list. The list shows available external and default vaults.

The **Oracle Compartment** field is unavailable (read-only) for external vaults.

3. Select the **Source**. The options are:
 - **CipherTrust (Local)**: Add key by creating or uploading a CipherTrust key as the source key. Refer to [Adding Key Material Using Local CipherTrust as External \(HYOK\) Source](#) for details.
 - **Luna HSM**: Add key by creating or uploading a Luna HSM key as the source key. Refer to [Adding Key Material Using Luna HSM as External \(HYOK\) Source](#) for details.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Adding Key Material Using Local CipherTrust as External (HYOK) Source

To add a key by creating or uploading a CipherTrust key as the source key:

Key Material Origin

1. Select **CipherTrust (Local)** as the **Source**.
2. Click **Next**. The Configure CipherTrust (Local) Key screen is displayed.

Source Key

Caution

Modify the Oracle External Vaults (HYOK) only through the CipherTrust Cloud Key Management (CCKM) GUI, API, and CLI. Do not modify the source key using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the Oracle (HYOK) key unavailable to the Oracle cloud services.

1. Select an option from **Source Key Material** to specify how to create the key. The options are:
 - **Create New Key**: Click to create a fresh key. Specify the Oracle Key Name for the new key.
 - **Select Existing Key**: Click to create a new key by copying an existing key. Select a source key from the available options.
2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique and user-friendly alias in the **Oracle Key Name** field. This will be the key name on Oracle cloud to help identify the Oracle key. By default, the Oracle Key Name specified previously, if creating a new key, is populated.
2. Specify a Rego policy for the key.
3. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the specified key details. These details are divided into **MATERIAL ORIGIN**, **SOURCE KEY**,

and **POLICY** sections.

Before adding the key, review all the details. After the key is added, certain features cannot be edited.

1. Review the key details displayed on the screen.

If you want to make any changes, click **Edit** adjacent to the **SOURCE KEY** and **HYOK KEY** sections. Alternatively, click **Back** and make changes.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is complete.

The key is created successfully when the status next to the **SOURCE KEY** and **HYOK KEY** sections changes to **Complete** and the Key ID links are displayed.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the Oracle keys list.

Adding Key Material Using Luna HSM as External (HYOK) Source

To add a key by creating or uploading a Luna HSM key as the source key:

Key Material Origin

1. Select **Luna HSM** as the **Source**.
2. Click **Next**. The Configure HSM Key screen is displayed.

Configure HSM Key

Caution

Modify the Oracle External Vaults (HYOK) only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not modify the source key using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the Oracle (HYOK) key unavailable to the Oracle cloud services.

1. Select the **Source Key Material**. This specifies how to create the key. The options are:
 - **Create New Key**
 - a. Select the desired **Partition ID** for the key. This drop-down list shows the Luna HSM partitions based on the Luna HSM connection added to the CipherTrust Manager. The new Luna HSM key is created in this partition.
 - b. Specify the **HSM Key Name** for the new key.

Note

The values of the **Key Type**, **Key Size**, and **Mechanism** fields are predefined and cannot be modified. The defined values of Key Type and Key Size are set to AES and 256, respectively.

c. Select the **Key Usage**. The options are:

- Modifiable, Sensitive: By default, these are selected for a **OCI HYOK Compatible** key.
- Extractable, Encrypt, Decrypt, Wrap, Unwrap

Note

By default, the Extractable option is inactive and cannot be modified.

- Sign, Verify
- **Select Existing Key:** Click to create a new key by selecting an existing key.
 - a. Select the desired **Partition ID** for the key. This drop-down list shows the Luna HSM partitions based on the Luna HSM connection added to the CipherTrust Manager.

Note

The values of the **Key Type**, **Key Size**, and **Mechanism** fields are predefined and cannot be modified. The defined values of Key Type and Key Size are set to AES and 256, respectively.

- b. Select an existing key from the **Select HSM Key** list. Alternatively, you can search for a key name using the **Key Name** field. This field shows the available keys based on the Luna HSM connection added to the CipherTrust Manager.

2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique and user-friendly alias in the **Oracle Key Name** field. This will be the key name on Oracle cloud to help identify the Oracle key. By default, the Oracle Key Name specified previously, if creating a new key, is populated.
2. Specify the **Policy**.

-
3. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the specified key details. These details are divided into **MATERIAL ORIGIN**, **SOURCE KEY**, and **HYOK KEY** sections.

Before adding the key, review all details. After the key is added, certain features cannot be edited.

1. Review the key details displayed on the screen.

If you want to make any changes, click **Edit** adjacent to the **SOURCE KEY** and **HYOK KEY** sections. Alternatively, click **Back** and make changes.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Make sure to leave the window open until the process is complete.

The key is created successfully when the status next to the **SOURCE KEY** and **HYOK KEY** sections changes to **Complete** and the Key ID links are displayed.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the Oracle keys list.

Creating Native Key Material

To create Oracle key using the native Oracle application:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click **Add Key**. The Key Material Origin screen of the Add Oracle Key wizard is displayed.

Key Material Origin

1. Select **Oracle Native** as the **Origin Type**.
2. Select the desired **Vault** from the drop-down list. The list shows available external and default vaults.
3. Select an **Oracle Compartment** from the drop-down list. The list shows the available compartments based on the selected vault. This field is mandatory for default vaults, and is read-only for external vaults.
4. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique and user-friendly alias in the **Oracle Key Name** field. This will be the key name on Oracle cloud to help identify the Oracle key.

-
2. Select the **Key Algorithm**. The options are **AES**, **RSA**, and **ECDSA**.
 3. Select the **Key Size** based on the key type:
 - For an **AES** key, the options are 16, 24, and 32 bytes.
 - For an **RSA** key, the options are 256, 384, and 512 bytes.
 - For an **ECDSA** key, the options are 32, 48, and 66 bytes.
 4. Select the **Protection Mode**. The options are Software and HSM.
 5. (Optional) Specify the tags.

To add a new tag:

- a. Select a **Tag Namespace**. The options are:
 - **Free Form**: Allows adding free form tags.
 - **Oracle Tags**: Allows adding tags based on created on and created by.
- b. Specify a **Tag Key**.
- c. Specify a **Tag Value**.
- d. Click **+**.

Similarly, add as many tags as required.

6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN and NATIVE KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **NATIVE KEY** section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is complete.

When the status next to the NATIVE KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the list of Oracle keys.

Viewing Oracle Keys

The Oracle Keys page shows the list of Oracle keys available on the CipherTrust Manager.

To view the Oracle keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**. The list of available Oracle keys is displayed. The Oracle Keys page displays the following details:

Field	Description
Name	Unique, user-friendly name of the Oracle key. Click the link to view additional details of the key or edit the key. Refer to Viewing or Editing Details of Oracle Keys . This name is useful in searching for specific keys.
Key ID	ID of the Oracle key.
Tenancy	Name of the Oracle tenancy.
Compartment	Name of the OCI compartment where the key resides.
Vault	Name of the OCI vault where the key resides.
Protection Mode	Protection mode for the key - HSM or Software.
Algorithm	Algorithm of the Oracle key. AES, RSA, and ECDSA algorithms with different keys sizes are supported.
State	State of the Oracle key.
Region	Region of the key.
Version	Version of the key.
Creation Date	Date and time when the Oracle key is created.
Deletion Date	Date and time when the Oracle key is deleted.
Origin	Source of the key material used for the version. The origin can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is

Field	Description
	unknown. It is different than CCKM and the native cloud. Refer to Key Creation Methods and Sources for details.

The **Region**, **Version**, **Creation Date**, and **Origin** columns are hidden by default. To show/hide a column, click the custom view icon (⚙️), select/clear the desired column, and click **OK**.

Viewing Key Versions

To view the versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**. The list of available Oracle keys is displayed.
3. Click the expand icon (▶) corresponding to the desired key. The mini detail view shows the list of key versions with their details.

Field	Description
Version ID	ID of the key version.
State	State of the key version. The state can be enabled or disabled.
Origin	Source of the key material. The origin of the key can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud.
Creation Date	Date and time when the Oracle key is created.

Alternatively, you can view the versions of a key in the details view of the key. Refer to [Viewing Key Version Details](#) for details.

Viewing or Editing Details of Oracle Keys

After a key is created, you can add tags to it, schedule their rotation, and view its versions.

In the edit view of a key, you can view all the key details such as its ID, compartment, vault, state, algorithm, and region etc.

To view or edit an Oracle key:

-
1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Cloud Keys > Oracle**. The list of available Oracle keys is displayed.
 3. Click the overflow icon () corresponding to the desired key and click **View/Edit Details**. Alternatively, you can click the key name link. The edit view of the key is displayed. The edit view is divided into:
 - **GENERAL INFO**: View the key ID and add tags. Refer to [Adding/Removing Tags](#) for details.
 - **KEY SCHEDULE**: Add, update, and disable a key rotation schedule. Refer to [Adding or Changing Key Rotation Schedule](#) and [Disabling Key Rotation Schedule](#).
 - **KEY VERSIONS**: View details of key versions. Refer to [Viewing Key Version Details](#).

Adding/Removing Tags

To add tags to a key:

1. Expand the **GENERAL INFO** section, if needed.
2. Select a **Tag Namespace**. The options are:
 - **Free Form**: Allows adding free form tags.
 - **Oracle Tags**: Allows adding tags based on created on and created by.
3. Specify a **Tag Key**.
4. Specify a **Tag Value**.
5. Click **+**. Similarly, add as many tags as required.
6. Click **Update**.

The tag is added to the key.

To remove a tag:

1. Expand the **GENERAL INFO** section, if needed.
2. Click the close icon in the added tags.
3. Click **Update**.

Adding or Changing Key Rotation Schedule

To add or update a key rotation schedule:

1. Expand the **KEY SCHEDULE** section.
2. From the **Select Rotation Schedule** drop-down list, select the desired schedule.

3. Select the **Key Origin**. The options are:

- CipherTrust (Local)
- CipherTrust (External), also **Select Domain** of the CipherTrust Manager.
- Native
- Luna, also select the Luna HSM **Partition**.
- DSM, also select the DSM **Domain**.

For keys based on ECDSA algorithms, only Native is available as the key origin.

4. Click **Update**.

The key rotation schedule is added/updated. The selected schedule is now assigned to the key. To view all the keys assigned to a schedule, refer to [Viewing Keys Assigned to Schedules](#).

Disabling Key Rotation Schedule

To disable a key rotation schedule:

1. Expand the KEY SCHEDULE section.
2. Next to the **Select Rotation Schedule** drop-down list, click the close icon (.

Auto key rotation is disabled.

Viewing Key Version Details

To view the details of key versions, expand the KEY VERSIONS section. The key version details are displayed. Refer to [Viewing Key Versions](#) for details.

Refreshing Oracle Keys

Refreshing is the process of downloading keys created in Oracle vaults to CCKM. You can refresh individual keys or all keys from all Oracle vaults at once.

Refreshing All Keys

To refresh all keys:

1. Open the Cloud Key Manager application.
2. In the left pane, click **Cloud Keys > Oracle**. The Oracle Keys tab is displayed. This tab displays the list of Oracle keys.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all keys is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message Refresh started... is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Oracle > Oracle Keys** page.

Refreshing Individual Keys

To refresh individual keys and their versions:

1. Open the Cloud Key Manager application.
2. In the left pane, click **Cloud Keys > Oracle**. The Oracle Keys page is displayed. This page displays the list of Oracle keys.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Refresh**. The Refresh Key dialog box is displayed. The key and all its versions will be refreshed.
5. Click **Refresh** to confirm the action.

The key with its versions is refreshed successfully.

The refreshed key and its versions are listed on the **Cloud Keys > Oracle > Oracle Keys** page.

Disabling an Oracle Key

This section is applicable to Oracle BYOK keys.

If required, you can disable an enabled key. A disabled key cannot operate on data. Disabling a key disables all versions of the key.

To disable a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Disable**. The Disable Key dialog box is displayed.
5. Click **Disable** to confirm the action.

The state of the key changes to Disabling, finally to Disabled.

Enabling an Oracle Key

This section is applicable to Oracle BYOK keys.

If required, you can enable a disabled key. Enabling a key enables all versions of the key.

To enable a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Enable**. The Enable Key dialog box is displayed.
5. Click **Enable** to confirm the action.

The state of the key changes to Enabling, finally to Enabled.

Moving Keys to Another Compartment

This section is applicable to Oracle BYOK keys.

If needed, you can move a key to another Oracle compartment.

To move a key to another compartment:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Move Resource**. The Move Resource dialog box is displayed.
5. **Select Compartment** from the drop-down list. The drop-down list shows the list of Oracle compartments linked with the added Oracle vaults.
6. Click **Save**.

The key is moved to the selected compartment.

Adding a Key Version for the Software or HSM Protection Mode

To add a key version for the Software or HSM Protection Modes in CCKM:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Cloud Keys > Oracle**.
-

3. Click the overflow icon () corresponding to the key with the HSM or Software protection mode.
4. Click **Add Version**. The Add Version dialog box is displayed.
5. Select a method from the **Select Method** field. The options are:
 - **Create/Upload New Key Material**: Refer to [Adding Key Version by Creating/Uploading Key Material](#).
 - **Clone Existing Key Material**: Refer to [Adding Key Version by Cloning Existing Key Material](#).

Refer to [Key Creation Methods and Sources](#) for details on key creation methods and key sources.

Adding Key Version by Creating New Key Material

To create a new key version for the HSM Protection Mode in CCKM :

1. Select **Create/Upload New Key Material** as the method.
2. Select a source from the **Select Source** field. The options are:
 - **CipherTrust (External)**: In this option, select the **Domain** and specify **Key Name** for the new key version.
 - **CipherTrust (Local)**: In this option, specify **Key Name** for the new key version.
 - **Oracle (Native)**: Use this option to create a new native Oracle key.
 - **Vormetric DSM**: In this option, specify **Key Name** for the new key version and select the DSM **Domain**.
 - **Luna HSM**: In this option, select the **Partition ID**, **Mechanism**, and **Key Attributes**, and specify **Key Name** for the new key version.

The key attributes **Modifiable** and **Sensitive** are selected for a **HYOK Compatible** key. By default, the **Extractable** option is inactive and cannot be modified.

3. Click **Add Version**.

A new version is added to the key. The Version Count increases by one on the Oracle Keys page.

Adding Key Version by Cloning Existing Key Material

To clone the existing key version for the HSM Protection Mode in CCKM :

1. Select the **Clone Existing Key Material** method.
2. Select a source from the **Select Source** field. The options are:
 - **CipherTrust (External)**
 - **CipherTrust (Local)**
 - **Vormetric DSM**

- **Luna HSM**

For the above options, you need to select a value from the **Select a source key** drop-down menu.

3. Click **Add Version**.

A new version is added to the key. The Version Count increases by one on the Oracle Keys page.

Adding a Key Version for the External Protection Mode

To add a key version for the External Protection Mode in CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the key with the External protection mode.
4. Click **Add Version**. The Add Version dialog box is displayed.
5. Select a method from the **Select Method** field. The options are:
 - **Create New Key**: Refer to [Adding Key Version by Creating New Key](#).
 - **Select Existing Key**: Refer to [Adding Key Version by Selecting Existing Key](#).

Adding Key Version by Creating New Key

To create a new key version for the External Protection Mode in CCKM :

1. Select the **Create New Key** method.
2. From the **Select Source** field, select the source of the key version. Either of the following options is displayed depending on the source of the parent key. For example, if the parent key source is Luna HSM, then only Luna HSM is listed for you to select.
 - **CipherTrust (Local)**: In this option, specify **Key Name** for the new key version.
 - **Luna HSM**: In this option, select the **Partition ID**, and specify **HSM Key Name** for the new key version. The values of the **Key Type**, **Key Size**, and **Mechanism** fields are predefined and cannot be modified. The defined values of **Key Type** and **Key Size** are set to **AES** and **256**, respectively.

The key attributes **Modifiable** and **Sensitive** are selected for a **HYOK Compatible** key. By default, the **Extractable** option is inactive and cannot be modified.

3. Specify **Key Name**.
4. Click **Add Version**.

A new version is added to the key. The Version Count increases by one on the Oracle Keys page.

Adding Key Version by Selecting Existing Key

To select an existing key version for the External Protection Mode in CCKM :

1. Select the **Select Existing Key** method.
2. From the **Select Source** field, select the source of the key version. Either of the following options is displayed depending on the source of the parent key. For example, if the parent key source is Luna HSM, then only Luna HSM is listed for you to select.
 - **CipherTrust (Local)**
 - **Luna HSM**
3. Click **Next**. The **Select Source Key and Add version** screen is displayed.
4. Select the desired key from the given list. Optionally, if **CipherTrust (Local)** is selected as source, you can select the **Fetch Latest Version Only** option to view the latest key versions.

Note

You can modify the number of key IDs displayed per page by clicking the  icon. This icon is located at the bottom of the key name list.

5. Click **Add Version**.

A new version is added to the key. The Version Count increases by one on the Oracle Keys page.

Scheduling Deletion of a Key

This section is applicable to Oracle BYOK keys.

With CCKM, you can schedule deletion of an Oracle BYOK key. The key is removed from Oracle at the specified time. Oracle enforces a waiting period of 7 to 30 days. After a key is deleted, it cannot be restored and the data encrypted with the key is unrecoverable. Before the waiting period ends, schedule key deletion can be cancelled.

Note

An external key (HYOK) resides on the CipherTrust Manager, it does not require a deletion schedule. The key can be deleted directly from the CipherTrust Manager. Refer to [Deleting External Keys](#).

To schedule the deletion of a key:

1. Open the **Cloud Key Manager** application.

-
2. In the left pane, click **Cloud Keys > Oracle**.
 3. Click the overflow icon () corresponding to the desired key.
 4. Click **Schedule Key Deletion**. The Schedule Key Deletion dialog box shows the name and ID of the key.
 5. Select **I wish to delete this key**.
 6. Specify the **Waiting period (in Days)**. The default waiting period is 30 days.
 7. Click **Schedule Deletion**.

A message stating that the key is scheduled for deletion is displayed. The key state changes to SCHEDULING_DELETION, then to PENDING_DELETION until the waiting period is over. After the waiting period is over, the key state becomes DELETED.

You can cancel the scheduled deletion of a key before the waiting period expires. Refer to [Canceling Deletion of a Key](#) for details.

Canceling Deletion of a Key

This section is applicable to Oracle BYOK keys.

Before the waiting period ends, the scheduled deletion of a key with the state PENDING_DELETION can be cancelled.

To cancel the scheduled deletion of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key with the state PENDING_DELETION.
4. Click **Cancel Key Deletion**. The Cancel Key Deletion dialog box shows the name and ID of the key.
5. Select **I wish to cancel key deletion**.
6. Click **Cancel Schedule Deletion**.

A message stating that the key deletion is canceled is displayed. The key state changes to CANCELLING_DELETION, then to ENABLED.

Removing a Key

When an Oracle key is deleted from Oracle cloud, its status on the CipherTrust Manager becomes DELETED. You can remove such keys with their versions and backup from the CipherTrust Manager.

Note

An external key (HYOK) resides on the CipherTrust Manager, it does not require a deletion schedule. The key can be deleted directly from the CipherTrust Manager. Refer to [Deleting External Keys](#).

To remove an Oracle key from the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key with the state DELETED.
4. Click **Remove Key**. The Remove Key dialog box is displayed.
5. Click **Remove Key** to confirm the action.

A message stating that the key is removed successfully is displayed.

Removing a Key Backup

This section is applicable to Oracle BYOK keys.

When the synchronization is initiated, Oracle cloud allows backup of keys that:

- Are stored in Virtual Private Vaults (VPVs)
- Are stored in vaults that have associated bucket credentials
- Have the HSM protection mode

When an Oracle key is deleted from Oracle cloud, its status on the CipherTrust Manager becomes DELETED. You can remove the backup of such keys from the CipherTrust Manager.

To remove the backup of an Oracle key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key with the state DELETED.
4. Click **Remove Key Backup**. The Remove Key Backup dialog box is displayed.
5. Click **Remove Key Backup** to confirm the action.

A message stating that the key backup is removed successfully is displayed.

Restoring a Deleted Key

This section is applicable to Oracle BYOK keys.

Only the keys with backup on the CipherTrust Manager can be restored.

To restore a deleted key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Restore Key**. The Restore Key dialog box shows is displayed.
5. Click **Restore** to confirm the action.

A message stating that the key is restored successfully is displayed.

Managing Oracle Tenancies

An Oracle tenancy is a secure and isolated partition of Oracle Cloud Infrastructure (OCI) to create, organize, and administer your cloud resources. You can add OCI tenancies manually (without Oracle connection) or using an [Oracle](#) connection configured on the CipherTrust Manager.

On the CipherTrust Manager, licensing for Oracle cloud is implemented based on OCI tenancies.

This section describes how to manage Oracle tenancies on CCKM.

- [Adding Oracle Tenancies](#)
- [Viewing Oracle Tenancies](#)
- [Removing Oracle Tenancies](#)

Adding Oracle Tenancies

To add an Oracle tenancy:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**. The Vaults tab of the Oracle Vaults page is displayed.
3. Click the **Tenancy** tab.
4. Click **Add Tenancy**. The Add Tenancy wizard is displayed.
5. Select one of the **Methods for choosing Oracle Tenancy**. You can select **Oracle Connection** or **Oracle Tenancy (no connection)**.

6. Click the desired tab to view the instructions.

Oracle Connection

Select a Connection.

Oracle Tenancy (no connection)

- a. Enter the **Tenancy** name.
 - b. Enter the **Tenancy OCID**.
7. Click **Add**. A message **Tenancy added successfully** is displayed on the screen.
 8. Click **Close**.

The newly created tenancy is displayed in the list of tenancies.

Viewing Oracle Tenancies

The Tenancy tab of the Oracle Vaults page shows the list of tenancies added to the CipherTrust Manager. Search for the tenancies by Tenancy Name or Tenancy OCID.

To view the list of tenancies added to the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**. The Vaults tab of the Oracle Vaults page is displayed.
3. Click the **Tenancy** tab.

The page displays the following details:

Column	Description
Tenancy	Name of the tenancy.
Tenancy OCID	OCID of the tenancy.
Date Added	Date and time when the tenancy was added.

To view/hide columns, click the Customize View (⚙️) icon, select/clear the desired option, and click **OK** to display the column.

Removing Oracle Tenancies

To remove an Oracle tenancy:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **KMS Containers > Oracle Vaults**. The Vaults tab of the Oracle Vaults page is displayed.
3. Click the **Tenancy** tab.
4. Click the overflow icon () corresponding to the desired tenancy.
5. Click **Remove Tenancy**. The Remove Tenancy dialog box is displayed.
6. Select **I wish to delete the tenancy**.
7. Click **Remove**.

A message **Tenancy deleted** is displayed on the screen.

Warning

Be extremely careful when deleting a tenancy. Once the tenancy is deleted, it will no longer be available for use.

Scheduling Operations

CCKM allows you to periodically refresh or rotate keys in the background. To refresh or rotate keys, you need to create schedule configuration. A schedule configuration defines when to run a refresh or rotation job. You can use either basic format or cron format to specify the time when the rotation or refresh job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- Repeats: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- at: specific time at which the rotation or refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

" * * * * * "

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -

Field	Allowed values	Allowed special characters
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. **Select Schedule Type as Key Rotation.**
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Oracle** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.
 - b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

Adding Key Refresh Schedule

A key refresh schedule synchronizes keys from linked Oracle vaults to Cloud Key Manager.

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. **Select Schedule Type as Key Refresh.**
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Oracle** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the "**Schedule Config**" screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.
 - b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Next**.
8. On the **Add Vaults** screen:
 - a. Select the desired vault from the **Refresh Keys from Selected Vault(s)** drop-down list.

- b. Click the **+** button. Similarly, you can add more vaults. To remove a vault, click the close (X) icon in the name of the vault.

Alternatively, if you want to refresh all the existing vaults, select the **Refresh All Vaults** check box. When selected, the **Refresh Keys from Selected Vault(s)** field becomes unavailable.

- c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created scheduled is displayed in the schedules list.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays the following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only)
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Start time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration. Never is displayed if the schedule is set to never expire.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

Alternatively, click the **Name** link corresponding to the desired schedule.

4. Edit or configure the following information:

- **GENERAL INFO:**

- Basic description of the schedule.
- Status of the scheduler configuration. Select **Enable Schedule** to enable the schedule, clear to disable.
- **SCHEDULE CONFIG**: Scheduler configuration parameters such as duration and frequency of the schedule. Refer to the key rotation [Schedule Config](#) screen or key refresh [Schedule Config](#) screen, as appropriate for details.
- **ORACLE VAULTS**: (For key refresh schedules only) Select vaults for the key refresh schedule.

To add a vault:

- a. Select the desired vault from the **Refresh Keys from Selected Oracle Vault(s)** drop-down list.
- b. Click **+** button. Similarly, you can add more vaults. To remove a vault, click the close (X) icon in the name of the vault.

Alternatively, if you want to refresh keys in all the existing vaults, select the **Refresh All Oracle Vaults** check box. When selected, the **Refresh Keys from Selected Oracle Group(s)** field becomes unavailable.

5. Click **Update** to save the changes.

The Schedules page also contains a section named **JOB HISTORY**. This section displays information related to a schedule such as **Run Date**, **Job ID**, **Status**, and **Errors**.

Viewing Keys Assigned to Schedules

Schedules for a key can be added, updated, and deleted on the KEY SCHEDULE section of the edit view of a key. Refer to [Adding or Changing Key Rotation Schedule](#) for details.

To view the keys assigned to a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

Alternatively, click the **Name** link corresponding to the desired schedule.

The mini detail view of the schedule shows a numbered link next to the **Keys Assigned** label. The number indicates the number of keys assigned to the schedule. If no key is assigned, linked number **0** is displayed.

4. Click the numbered link. The Oracle Keys for Schedule: <schedule-name> page is displayed. The page displays the following details:

Field	Description
Name	Unique, user-friendly name of the Oracle key. Click

Field	Description
	the link to view additional details of the key or edit the key. Refer to Viewing or Editing Details of Oracle Keys . This name is useful in searching for specific keys.
Key ID	ID of the Oracle key.
Tenancy	Name of the Oracle tenancy.
Compartment	Name of the OCI compartment where the key resides.
Vault	Name of the OCI vault where the key resides.
Protection Mode	Protection mode for the key - HSM or Software.
Algorithm	Algorithm of the Oracle key. AES, RSA, and ECDSA algorithms with different keys sizes are supported.
State	State of the Oracle key.
Region	Region of the key.
Version	Version of the key.
Creation Date	Date and time when the Oracle key is created.
Deletion Date	Date and time when the Oracle key is deleted.
Origin	Source of the key material used for the version. The origin can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud. Refer to Key Creation Methods and Sources for details.

The **Region**, **Version**, **Creation Date**, and **Origin** columns are hidden by default. To show/hide a column, click the custom view icon () , select/clear the desired column, and click **OK**.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.

-
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
 4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Managing Oracle Reports

CCKM provides options to generate key visibility reports based on key-related activities between CCKM and Oracle vaults and rotation schedules. Use the reports to track keys by their expiration dates.

Oracle reports are categorized as:

- **Key Activity Report:** Inspect individual Oracle key histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and Oracle vaults.
- **Key Rotation Report:** Track keys that have been rotated or will be rotated between the selected period.
- **Key Aging Report:** Track Oracle keys by their expiration dates. Audit a range of dates, from past material deletions to future scheduled deletions, within selected Oracle vaults.

Creating Oracle Reports

Note

OCI supports key rotation reports for a period of maximum 14 days. When generating key rotation reports, make sure that the period between the start and end time is not more than 14 days.

To create an Oracle report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Oracle**. The Oracle Reports page is displayed.
3. Click **Add Report**. The Choose Report Type and Name screen of the Add Oracle Report wizard is displayed.
4. Select the report type. The options are **Key Activity Report**, **Key Rotation Report**, and **Key Aging Report**.
5. Specify a **Report Name**. This is a mandatory field.
6. Click **Next**. The Select Oracle Vault screen of the wizard is displayed.
7. Select a vault from the **Oracle Vaults** drop-down list. The drop-down list contains the list of Oracle vaults added to the CipherTrust Manager.
8. Click **Add**. The selected vault appears under the Selected Oracle Parameters section.

Similarly, you can add as many vaults as you want.

9. Click **Next**. The Set Start and End Dates screen of the wizard is displayed.
10. In the **Include Entries From** field, specify the start date and time for the report.

- Click the field and select the date and time on the on-screen calendar.
- Alternatively, enter the time in **MM/DD/YYYYHH:MM** format.

11. In the **To** field, specify the end date and time for the report.

12. Click **Save**.

A success message **Created report** is displayed. The newly created report is displayed under the Oracle reports list. The report Run Date becomes *Running Now* and Status becomes *In Progress*. After the run is complete, the date and time of the run is displayed and the Status becomes Completed.

Viewing Oracle Reports

The Oracle Reports page displays the list of existing reports. Filter the reports by their names.

To view existing Oracle reports:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Oracle**. The list of available reports is displayed. The following details of the reports are displayed:

Column Name	Description
Report Name	Name of the report.
Run Date	When the report is run. If a report is running currently, Running Now is displayed.
Type	Type of the report. The type can be: • Key Activity • Key Rotation • Key Aging
Start Date	Start date from when the report is generated.
End Date	End date for the report.
Status	Status of the report. The status can be: • Completed • In Progress

Viewing Details of an Oracle Report

To view the details of an Oracle report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Oracle**. The list of available reports is displayed.

- Click the desired **Report Name** link.

Alternatively, click the overflow icon () corresponding to the desired report and click **View**.

For a Key Aging report, the REPORT DETAILS section shows the following details of the reports:

Column Name	Description
Key Name	Name of the key.
Oracle Key ID	ID of the Oracle key.
Vault ID	ID of the Oracle vault where the key resides.
Time of Deletion	Date and time when the key is/will be deleted.

For a Key Activity report, the REPORT DETAILS section shows the following details of the reports:

Column Name	Description
Key Name	Name of the key.
Oracle Key ID	ID of the Oracle key.
Vault ID	ID of the Oracle vault where the key resides.
Key Activity	Activity performed on the key.
Oracle User	Name of the Oracle user who created the report.
Modified Time	Date and time when the key is modified.

Downloading Oracle Reports

To download an Oracle report as a CSV file:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Reports > Oracle**. The list of available reports is displayed.
- Click the overflow icon () corresponding to the desired report and click **Download**.

Alternatively, click the desired report under **Report Name**, and click **Download CSV** in the detail view.

The report is downloaded as a CSV file.

Deleting Oracle Reports

To delete an Oracle report:

- Open the **Cloud Key Manager** application.

-
2. In the left pane, click **Reports > Oracle**. The list of available reports is displayed.
 3. Click the overflow icon () corresponding to the desired report and click **Delete**. The Delete Report message is displayed.
 4. Click **Delete**.

The report is removed from the list of reports.

Managing Oracle Compartments

An Oracle key belongs to a compartment and a vault at the same time. When an Oracle vault is added to the CipherTrust Manager, linked Oracle compartments are automatically added. You can also add compartments to CCKM manually. One compartment can have multiple Oracle vaults associated with it.

When the last vault linked with an Oracle compartment is deleted from the CipherTrust Manager, the linked compartment is also deleted.

The Compartments tab of the Oracle Vaults page shows the list of compartments linked with the vaults added to the CipherTrust Manager. Search for the compartments by Tenant.

Adding Oracle Compartments

To add an Oracle compartment:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **Compartments** tab.
4. Click **Add Existing Compartment**.
5. Select the desired **Connection**.
6. Select the desired **Compartment ID** from the list. The list shows the Oracle compartments associated with the selected connection.
7. Expand the compartment ID to view the compartment hierarchy.
8. Select the desired compartments from the hierarchy.
9. Click **Save**.

The newly added compartments are displayed in the list of Oracle compartments.

Viewing Oracle Compartments

To view the list of compartments:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **Compartments** tab. The tab displays the following details:

Column	Description
Compartment	Name of the Oracle compartment.
Tenant	Name of the Oracle tenant.
Date Added	Date and time when the compartment is added to the CipherTrust Manager.

Deleting Oracle Compartments

To delete an Oracle compartment:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **Compartments** tab. The tab displays the list of Oracle compartments added to CCKM.
4. Click the overflow icon () corresponding to the compartment you want to delete.
5. Click **Remove Compartment**.
6. Select **I wish to delete the compartment**.
7. Click **Delete**.

The compartment is deleted successfully.

Downloading Oracle Metadata

Downloading Oracle Keys Metadata

CCKM users with permissions to view the Oracle keys can export and download the keys metadata displayed on the CCKM GUI. Filter the keys metadata to display on the GUI based on your requirements, for example, all keys created in the past 12 months, all keys residing in a specific Oracle vault, and all keys based on a specific algorithm. You can then download the filtered metadata as a CSV file.

To download the Oracle keys metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**. The Oracle Keys page is displayed.
3. Filter the keys metadata based on your requirements.

Use the Search box to filter the keys. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The filtered Oracle keys metadata is downloaded as a CSV file.

OCI External Resources

Oracle Cloud Infrastructure (OCI) Key Management Service (KMS) with external vault capability allows you to use a third-party on-premises key management system like CipherTrust Manager. This provides greater control over encryption keys that protect your data in the Oracle cloud.

CipherTrust Cloud Key Manager (CCKM) on the CipherTrust Manager uses external keys for performing cryptographic (encrypt/decrypt) operations on demand, while preserving end-user control to manage external keys. The lifecycle of external keys on the CipherTrust Manager is managed by CCKM only. The OCI KMS does not have any control over these keys.

The CipherTrust Manager exposes a network endpoint. This allows the OCI KMS to forward any cryptographic requests to the CipherTrust Manager for processing.

Prerequisites

Before integrating the CipherTrust Manager as an External Key Manager (EKM), make sure the following.

CipherTrust Manager

- A CipherTrust Manager is deployed. Refer to [Getting Started](#) for details.
- The NTP server is added. Refer to [Add an NTP Server](#) for details.
- The web interface must have a TLS certificate signed by an external or local Certificate Authority (CA). The CA bundle should be provided while creating a [private endpoint](#) on OCI.
- The Subject Alternative Name (SAN) in the web interface certificate must have specific IP Addresses.
 - A good default value for the SAN is the IP address of the CipherTrust Manager.
 - If you are using a load balancer, and it is set to do SSL passthrough, include the IP address of the load balancer in the SAN.
 - If you are using FQDN, SAN should be the FQDN of the CipherTrust Manager. Refer to [Adding the web certificate for FQDN connectivity](#) for details.

Refer to [SSL/TLS server certificate \(NAE, KMIP, and WEB\)](#) for details.

Note

- OCI does not provide any option to update the IP address or the CA bundle in private endpoints. If you change the CA of the web interface certificate or the IP address of the CipherTrust Manager or Load Balancer, the network connectivity is disrupted. As a result, OCI faces network connectivity issues and all operations with the CipherTrust Manager stop working. In this case, you need to reconfigure the complete setup on OCI.
- It is recommended to use the IAM Domain version of Oracle Identity Cloud Service (IDCS) for managing OCI vaults under EKM and keys (OCI HYOK). To use OCI HYOK with the tenancy that doesn't support the IAM Domain version, please contact [Thales Customer Support](#).

Oracle Cloud Infrastructure (OCI)

1. A Virtual Cloud Network (VCN) is created in OCI Networking. Refer to the [Creating a Virtual Cloud Network](#) for details.
2. (Optional, recommended) FastConnect (Co-lo) is created in OCI Networking. This is required to have direct connectivity between the OCI VCN and the CipherTrust Manager on premises. Refer to the [FastConnect](#) documentation for details.
3. Policies are created in OCI Identity.

A policy is a document that specifies who can access which OCI resources that your company has, and how. A policy simply allows a group to work in certain ways with specific types of resources in a particular compartment.

Refer to [Getting Started with Policies](#) for details.

4. A private endpoint is created. Refer to [Creating a Private Endpoint](#) for details.

Note

For FQDN connectivity:

Configuration using FQDN requires a private API Gateway in a private subnet. The private subnet must have a NAT Gateway to route requests from the API Gateway to EKM.

While creating a private endpoint, you need to provide the IP Address of OCI API Gateway in the External Key Management Private IP address field. To get the IP address.

- a. [Create an OCI API gateway with FQDN](#).

- b. Deploy the API gateway with FQDN.

After ensuring the prerequisites, perform the steps described in the subsequent sections.

Note

CCKM supports both commercial and dedicated OCI regions. Thales has validated only the commercial regions, while Oracle has validated the dedicated regions. For any issues related to the dedicated regions, contact the Oracle support team.

Add OCI Tenancy on CipherTrust Manager

On the CipherTrust Manager, add an OCI tenancy. You can add OCI tenancies manually (without Oracle connection) or using an [Oracle](#) connection configured on the CipherTrust Manager. Refer to [Adding Oracle Tenancies](#) for details.

After adding the OCI tenancy, register the CipherTrust Manager with OCI Identity Domain as a confidential application.

Register CipherTrust Manager with OCI Identity Domain

Register the CipherTrust Manager (an External Key Manager) as a confidential resource application with Oracle Identity Domain and enable the client credentials grant, if the Identity Domain is protected.

While registering the CipherTrust Manager, add the `oci_ekms` scope. Refer to [Creating Confidential Resource App](#) for details.

After registration, the CipherTrust Manager application's client credentials are generated if the Identity Domain is protected. Note down the credentials and the Identity Domain URL. These will be required for registering the JWT issuer (identity provider).

Register Identity Provider with CipherTrust Manager

Register an identity provider on the CipherTrust Manager. Specify the JWKS URI or OpenID configuration URL (the Identity Domain URL and the suffix string, `/.well-known/openid-configuration`) and CipherTrust Manager application's client credentials (if the OCI Identity Domain is protected). These details are generated during the step [Register CipherTrust Manager with OCI Identity Domain](#).

To register the identity provider with the CipherTrust Manager:

1. Log on to the CipherTrust Manager GUI.
2. Add the identity provider. Refer to [Creating Identity Providers](#) for details.

CipherTrust Manager verifies the provided JWKS URI and credentials from the OCI Identity Domain and saves the credentials securely on successful verification.

A JWT issuer ID is generated. This ID is required when creating an external vault on the CipherTrust Manager.

Register OCI KMS Application

Register the OCI KMS application as a confidential client application and enable the client credentials grant. Next, bind the CipherTrust Manager, which you registered [as a confidential resource application](#). This binding is required to associate the OCI KMS client to the CCKM authorized resource (CipherTrust Manager).

Refer to the Oracle documentation for details.

On OCI:

1. Register the OCI KMS Client application as a confidential client application.
2. Bind the OCI KMS Client application with the CipherTrust Manager application that you registered [as a confidential resource application](#).

After the KMS client application registration and binding, a KMS client ID is generated. This ID is required for creating an external vault on the CipherTrust Manager.

Creating External Vaults

To create an external vault:

1. On the **CipherTrust Manager**, create an external vault using the KMS client ID created in [Register OCI KMS Client Application](#) and the JWT issuer ID generated in [Register Identity Provider with CipherTrust Manager](#).

During this step, an external vault is created locally on the CipherTrust Manager and an *external vault endpoint URI* is generated. This URI can be found in the details of the external vault resource.

Refer to [Adding External Vaults](#) for details.

2. On **OCI**, create a vault under EKM using the *external vault endpoint URI* generated in the previous step. Refer to the [External Key Management Service](#) documentation for details.

Note

If the CipherTrust Manager's web interface is configured on a port other than 443, the port number should be added to the *external vault endpoint URI* while creating a vault under EKM on OCI.

The vault created under EKM on the OCI KMS is mapped with the external vault created on the CipherTrust Manager.

Creating External Keys

To create an external key:

1. On the **CipherTrust Manager**, create a key in the external vault created on the CipherTrust Manager (refer to the previous step). You can select an existing source key or create a new key.

An *external key ID* is generated. This external key ID can be found in the details of the external key resource.

Refer to [Adding External Keys](#) for details.

2. On **OCI**, create an external key reference using the *external key ID* generated in the previous step. Refer to the [External Key Management Service](#) documentation for details.

The external key reference created on the OCI KMS is mapped with the external key created on the CipherTrust Manager.

Rotating External Keys

To rotate an external key:

1. On the **CipherTrust Manager**, create a new key version in the external vault created on the CipherTrust Manager (refer to the previous step). You can select an existing source key or create a new key.

A *version ID* is generated. This version ID can be found in the details of the external key resource.

Refer to [Adding a Key Version](#) for details.

2. On **OCI**, rotate an external key reference using the *version ID* generated in the previous step. Refer to the [External Key Management Service](#) documentation for details.

The external key reference created on the OCI KMS is mapped with the version ID created on the CipherTrust Manager.

Deployment Tutorials

- [Deploy Thales CCKM in OCI and Set Up a Cluster with CA Role](#)
- [Set Up Oracle Hold Your Own Key \(HYOK\) with CipherTrust Manager \(No API Gateway\)](#)
- [Set Up Oracle Hold Your Own Key \(HYOK\) with CipherTrust Manager \(With API Gateway\)](#)
- [Enable OCI HYOK with Thales CipherTrust Manager Using OCI Load Balancer for High Availability](#)

What Next?

After completing the prerequisites, you can manage external vaults and keys on the CipherTrust Manager.

- [Managing Identity Providers](#)
- [Managing External Vaults](#)
- [Managing External Keys](#)

- Performance Summary

Managing Identity Providers

This section describes how to manage identity providers on CCKM.

Identity providers can be added, viewed, modified, or deleted on the External Vaults tab of the Oracle Vaults page. Identity providers are required when adding the external vaults, refer to [Managing External Vaults](#) for details.

Creating Identity Providers

An issuer or an openId configuration URL is required to create an identity provider.

To create an identity provider:

1. Open the **Cloud Key Manager** Application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. Scroll down the page, go to the **IDENTITY PROVIDERS** section, and click **Add Identity Provider**. The General Info tab of the Add Identity Provider screen is displayed.

General Info

1. Specify a unique **Name** for the provider. This is a mandatory field.
2. **Select Provider Verifier**. This is a mandatory field. The verifier can be **Issuer** or **OpenID Configuration URL**.

Note

- **OpenID Configuration URL** is the recommended option.
- If you select the **Issuer** option, you need to specify a combination of **Issuer** and **jwksURL**.
- If you select the **OpenID Configuration URL** option, you need to specify a **OpenID Configuration URL**.

Make sure to provide the exact CipherTrust Manager application's credentials, as received from Oracle; otherwise, external APIs might cease to work as expected. Currently, only Oracle IDCS is supported as identity provider and the issuer should be `https://identity.oraclecloud.com/`.

3. (If Oracle IDCS is configured in the protected mode), select **jwks Protected URL** and specify the following:
 - **Client ID**: Client ID of the CipherTrust Manager application as registered on third-party IDP.

- **Client Secret:** Client secret of the CipherTrust Manager application as registered on third-party IDP.

4. Click **Next**. The Regional Settings (Optional) tab of the Add Identity Provider screen is displayed.

Regional Settings (Optional)

1. Enter **Regional jwks URL(s)** or **Regional OpenID Config URL(s)**, depending on the Provider Verifier you have selected in the General Info tab.
2. Click **Add Regional URL(s)**.

Note

You can add multiple regional URLs.

3. Click **Add**.
4. Click **Close**.

The newly created identity provider appears in the providers list. Similarly, add as many identity providers as required.

To enable multi-region functionality with FQDN connectivity:

1. In the Oracle Cloud Console, create an API Gateway and a private endpoint in the **destination region**. Ensure both are in the same Virtual Cloud Network (VCN).
2. In the IDCS domain for the destination region, create **two new resource applications**:
 - **First application:** Set the primary audience to the static IP address of the API Gateway in the destination region.
 - **Second application:** Set the primary audience to the FQDN of your application CipherTrust Manager.

Add a scope to each application, and include both scopes in the resources field of the existing **client application**.

Note

This results in a configuration with three resource applications and one client application that includes the scopes from all three.

3. In your application (CipherTrust Manager), add the regional IDCS URLs for the **source** and **destination** regions to the Identity Provider (IDP), and the primary OCI region.

4. On the **Replicate Vault** page, replicate the vault from the source region. You will need to select the destination region, IDCS domain name, and private endpoint (PE).

Viewing Identity Providers

The Oracle Vaults page shows the available identity providers. The IDENTITY PROVIDERS section shows the Name, Issuer, OpenID Configuration URL, and jwksURL.

To view identity providers:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. Navigate to **IDENTITY PROVIDERS**. The list of identity providers is displayed.

The following details are shown:

Column	Description
Name	Name of the identity provider.
Issuer	Issuer string from the identity provider JWT.
OpenID Configuration URL	URL of the OpenID configuration.
jwksURL	URL of JWKS.

Editing Identity Providers

To edit identity providers:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. Navigate to **IDENTITY PROVIDERS**. Under Name, click the desired profile. The details screen of the Identity Provider is displayed.

Alternatively, click the overflow icon  corresponding to the desired profile and click **View/Edit**.

Under GENERAL INFORMATION

1. (Optional) Update **Name**.
2. (Optional) Update **jwks Protected URL**.

- a. Enter a new **Client ID**.
- b. Enter a new **Client Secret**.

Note

Do not leave the Client ID and Client Secret empty.

3. Click **Update**.

Under **REGIONAL SETTINGS**

1. (Optional) Add new regional URL(s).
 - a. Enter new **Regional jwks URL(s)** or **Regional OpenID Config URL(s)**, depending on the Provider Verifier that has been selected for this identity provider.
 - b. Click **Add Regional URL(s)**.
2. (Optional) Edit existing regional URL(s).
 - a. Click the **Edit** icon corresponding to the desired regional URL.
 - b. Update **regional URL**.
 - c. Click **Save**.
3. (Optional) Deleting the existing regional URL(s).

Click the **Delete** icon corresponding to the desired regional URL.
4. Click **Update**.

Deleting Identity Providers

When an identity provider is no longer needed, delete it from the CipherTrust Manager. Before deleting the provider, ensure that it is not in use by any external vaults.

To delete an identify provider:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. Under **IDENTITY PROVIDERS**, click the overflow icon  corresponding to the to the desired provider and click **Delete**. The **Delete Identity Provider** dialog box appeared on the screen.

Are you sure you want to delete? message is displayed in the dialog box.

- Click **Delete Identity Provider** to confirm the deletion.

Note

If the issuer (identity provider) is associated with an existing external vault, you will see an **Error in deleting identity provider** message. You need to modify the association to delete the issuer.

A success message is displayed on the screen. The identity provider is removed from the providers list.

Managing External Vaults

This section describes how to manage external vaults on CCKM. Before proceeding, [an identity provider](#) must be created.

External vaults can be added, viewed, modified, or deleted on the External Vaults tab of the Oracle Vaults page of the CipherTrust Cloud Key Manager (CCKM) GUI.

Adding External Vaults

You can add external vaults linked to an Oracle connection to the CipherTrust Manager. An external vault can only be added just once.

To add an external vault:

- Open the **Cloud Key Manager** application.
- In the left pane, click **KMS Containers > Oracle Vaults**. The Vaults tab of the Oracle Vaults page is displayed.
- Click the **External Vaults** tab.
- Click **Add External Vault**. The Add External Vault wizard is displayed.
- Enter a unique **Vault Name**.
- From **Methods for choosing Oracle Tenancy**, select one of the methods. The options are:
 - **Oracle Connection:** Select to specify an Oracle connection. The **Select a Connection** drop-down list is displayed.

Refer to [Connection Manager](#) to create an Oracle Connection if needed.
 - **Oracle Tenancy (no connection):** Select to specify a tenancy. The **Tenancy** drop-down list is displayed.
- Depending on the method selected in the previous step, **Select a Connection** or **Tenancy** from the drop-

down list.

8. (Optional) Switch the **Enable success audit events** toggle on or off to control the audit recording of success logs for the specified endpoint. By default, this toggle is set to active to troubleshoot performance issues.

Note

For improved performance, it is recommended to switch off the **Enable success audit events** toggle.

9. (Optional) Select a **Source Key Tier**. The options are:

- CipherTrust
- Luna HSM, also **Select a Luna Partition**. FM-enabled Luna HSM is not supported as a key source.

If you want to clear the selected Source Key Tier, click **Clear**.

10. **Select an Issuer** from the drop-down list.
11. Enter **Client Application ID** of the OCI KMS application as registered in [Register OCI KMS Application](#).
12. In **Endpoint URL Hostname**, specify the IP address for the OCI external vault endpoint URL. Specify the IP address of the CipherTrust Manager or Load Balancer. In case of FDQN connectivity, specify the IP address of the OCI API gateway.
13. (Optional) In **Endpoint URL Port**, specify the port number for the OCI external vault endpoint URL. Specify the port of the CipherTrust Manager or Load Balancer. The default port is **443**.

Note

The web interface port within CipherTrust Manager can be changed from the default port of **443** to another port. If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it **before** configuring the OCI EKMS (HYOK) on CCKM. Also, reflect this port change when creating an external vault on CCKM. Changing the default port **after** configuring OCI EKMS is not supported. Refer to [Support for Changing the Default Port of Web Interface Setting](#) for instructions on changing the port when configuring OCI EKMS.

14. (Optional) Enter **Policy**.
15. Click **Add**.
16. Click **Close**.

The selected vault is displayed on the External Vaults tab of the Oracle Vaults page.

The vault is available for [adding external keys](#).

Viewing External Vaults

To view the list of the external vaults added to the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab. The External Vaults tab of the Oracle Vaults page shows the list of external vaults added to the CipherTrust Manager.

The page displays the following details:

Column	Description
Name	Name of the external vault.
External Vault URL	URL of the external vault.
Status	Status of the external vault, BLOCKED or UNBLOCKED.
Tenancy	Name of the Oracle tenancy.
Identity Provider	Name of the identity provider.
Connection	Name of the Oracle connection added to the CipherTrust Manager.
Source Key Tier	Name of the Source Key Tier, Luna HSM and CipherTrust.
Date Added	Date and time when the external vault was added.

To view/hide columns, click the Customize View () icon, select/clear the desired option, and click **OK** to display the column.

Viewing or Editing Details of an External Vault

To view or edit the details of an external vault on CCKM:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **KMS Containers > Oracle Vaults**.
 3. Click the **External Vaults** tab.
 4. On the External Vaults tab, click the **Name** link of the desired vault.
-

Alternatively, click the overflow icon () corresponding to the desired vault, and click **View/Edit Details**.

The ORACLE VAULT DETAILS page shows additional details of the selected vault under the GENERAL INFO and ACCESS CONTROL sections. Expand each section to view and edit their details.

The GENERAL INFO section provides details of Endpoint URL Hostname, Identity Provider, and Policy. If needed, you can edit these details, as appropriate.

Editing Details of an External Vault

You can change the endpoint URL hostname, identity provider, and policy of an external vault on the CipherTrust Manager.

1. Expand **GENERAL INFO**.
2. Update the **Endpoint URL Hostname**. Specify the IP address of the CipherTrust Manager or Load Balancer. *FQDNs are not supported.*
3. Update the **Endpoint URL Port**. Specify the port number for the OCI external vault endpoint URL. Specify the port of the CipherTrust Manager or Load Balancer. The default port is 443.
4. Update the **Identity Provider** from the drop-down list.
5. Update the **Policy**. Specify a valid Rego policy.
6. Click **Update**.

Managing User Permissions on External Vaults

To work with the external resources, users/groups must have the minimum set of permissions that allow them to use the external resources such as external keys and vaults. Initially, the CCKM user only has permission to view the external keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on external vaults.

Users with the following characteristics can perform operations on external keys and vaults:

- Users in the **CCKM Admins** group
- Users in the **Admin** group
- Users who are administrators for a **domain**
- Users who are in the **CCKM Users** group and which have had a CCKM Admin assign permissions through the UI or the `/v1/cckm/oci/vaults/{id}/update-acls` endpoint in the REST API.

Adding Permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. On the External Vaults tab, click the **Name** link of the desired vault.

Alternatively, click the overflow icon () corresponding to the desired vault, and click **View/Edit Details**.

5. Expand the ACCESS CONTROL section.
6. Click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
7. Select the desired user or group from the **User/Group** drop-down list.
8. Click **Save**.

The newly added user/group is displayed under **Name** in the ACCESS CONTROL section. You can now grant additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the ACCESS CONTROL section, select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a Permission

To remove a permission assigned to a user or group:

1. In the ACCESS CONTROL section, clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the ACCESS CONTROL section, under **Unassign**, click the **X** button corresponding to the desired user/group.
2. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

3. Click **Remove** to confirm the action. To cancel the action, click **Keep It**.

A success message is displayed on the screen.

Removing External Vaults

External vaults can be removed on the Oracle Vaults page. Search for existing external vaults using Vault Name, Tenant, or Compartment.

Note

- Removing an external vault is an irreversible operation which permanently deletes unique identifiers required by the corresponding OCI vaults under External Key Manager (EKM).
- Before deleting an external vault from the CipherTrust Manager, ensure that the vault contains no external keys. Delete all external keys stored in the vault.

To remove an external vault from the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. On the External Vaults tab, click the overflow icon () corresponding to the vault you want to remove.
5. Click **Remove Vault**.
6. Select **I wish to delete the vault**.

-
7. Click **Delete**.

The external vault is deleted successfully. It is removed from the list of external vaults.

Blocking External Vaults

External vaults can be blocked on the Oracle Vaults page. Search for existing external vaults using Vault Name, Tenant, or Compartment.

When you block an external vault, all the external keys in the vault will be blocked. Any subsequent requests to the keys will fail. Blocking an external vault will also prevent any cryptographic operations on the key from the OCI KMS as well.

To block an external vault from CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. On the External Vaults tab, click the overflow icon () corresponding to the external vault you want to block.
5. Click **Block**.

All keys in the vault will be blocked. Any subsequent requests to the keys will fail.

6. Click **Confirm**.

The external vault is blocked successfully. The status of external vault changes to BLOCKED.

Unblocking External Vaults

Blocked external vaults can be unblocked on the Oracle Vaults page. Search for blocked external vaults using Vault Name, Tenant, or Compartment.

To unblock an external vault from the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Oracle Vaults**.
3. Click the **External Vaults** tab.
4. On the External Vaults tab, click the overflow icon () corresponding to the external vault you want to unblock.
5. Click **Unblock**.

All keys in the vault will be unblocked.

6. Click **Confirm**.

The external vault is unblocked successfully. The status of external vault changes to UNBLOCKED.

Managing External Keys

This section describes how to manage external keys on CCKM. Before proceeding, you must have an external vault added to the CCKM. Refer to [Managing External Vaults](#) for details.

- [Adding External Keys](#)
- [Viewing or Editing Details of External Keys](#)
- [Adding a Key Version](#)
- [Blocking External Keys](#)
- [Unblocking External Keys](#)
- [Deleting External Keys](#)

Note

- This section describes the operations specific to the external keys.
- External keys do not support the enable key, disable key, schedule key deletion, move resource, and restore deleted keys operations.
- All other operations that can be performed on external keys are similar to those for Oracle BYOK keys, as described in [Managing Oracle Keys](#).
- CCKM doesn't support FM-enabled Luna HSM as a key source.

Adding External Keys

To add an external key.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click **Add Key**. The Key Material Origin screen of the Add Oracle Key wizard is displayed.

Key Material Origin

1. Select **Oracle External (HYOK)** as the **Origin Type**.
2. Select an external **Vault** from the drop-down list. The list shows available external and default vaults.

The **Oracle Compartment** field is unavailable (read-only) for external vaults.

3. Select **CipherTrust (Local)** or **Luna HSM** as the **Source**.

Note

- You can select Luna HSM as the source, if the selected external vault is not CipherTrust.
- FM-enabled Luna HSM is not supported as a key source.

- a. Click **Next**. The Source Key screen is displayed.

Source Key

1. Click the desired source for instructions.

CipherTrust (Local)

Select the **Source Key Material**. This specifies how to create the key. The options are:

- **Create New Key**: Click to create a fresh key. Specify an **Oracle Key Name**.
- **Select Existing Key**: Click to create a new key by selecting an existing key. Select an existing key from the **Select a source key** drop-down list.

Luna HSM

- a. Select the **Source Key Material**, the options are **Create New Key** and **Select Existing Key**.
- b. Click the desired tab to view the instructions.

Create New Key

- a. **Create New Key**: Click to create a fresh key.
- b. Select a **Partition** from the drop-down list.
- c. Enter the **HSM Key Name**.
- d. Update the **Key Usage** from the available options.

Select Existing Key

- a. **Select Existing Key**: Click to create a new key by selecting an existing key.
- b. Select a **Partition** from the drop-down list.
- c. Select a **HSM Key Name** from the drop-down list.

-
2. Click **Next**. The Configure Oracle Key screen is displayed.

Configure Oracle Key

1. Enter a unique, user-friendly alias as the **Oracle Key Name**. This will be the key name on the Oracle cloud. This name helps uniquely identify an external key.
2. Enter a Rego policy to be associated with the external key.
3. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, Source Key, and HYOK KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **Source Key** and **HYOK KEY** sections and update the details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the HYOK KEY section becomes Complete and the Oracle Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Oracle Key wizard is closed.

The newly created key is displayed in the list of Oracle keys.

Viewing or Editing Details of External Keys

After a key is created, you can add tags to it, schedule their rotation, and view its versions.

In the edit view of a key, you can view all the key details such as its ID, compartment, vault, state, algorithm, and region etc.

To view or edit an external key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**. The list of available keys is displayed.
3. Click the overflow icon () corresponding to the desired key and click **View/Edit Details**. Alternatively, you can click the key name link. The edit view of the key is displayed. The edit view is divided into:
 - **GENERAL INFO**: View and update the key name and policy. Refer to [Updating Key Name and Policy](#) for

details.

- **KEY SCHEDULE:** Add, update, and disable a key rotation schedule. Refer to [Adding or Changing Key Rotation Schedule](#) and [Disabling Key Rotation Schedule](#).
- **KEY VERSIONS:** View details of key versions. Refer to [Viewing Key Version Details](#).

Updating Key Name and Policy

To update the key name and policy.

1. Edit **Key Name**.
2. Edit **Policy**.
3. Click **Update**.

Adding or Changing Key Rotation Schedule

To add or update a key rotation schedule:

1. Expand the **KEY SCHEDULE** section.
2. From the **Select Rotation Schedule** drop-down list, select the desired schedule.
3. Select the **Key Origin**. The options are:
 - CipherTrust (Local)
 - Luna, also select the Luna HSM **Partition**. FM-enabled Luna HSM is not supported as a key source.
4. Click **Update**.

The key rotation schedule is added/updated. The selected schedule is now assigned to the key. To view all the keys assigned to a schedule, refer to [Viewing Keys Assigned to Schedules](#).

Disabling Key Rotation Schedule

To disable a key rotation schedule:

1. Expand the **KEY SCHEDULE** section.
2. Next to the **Select Rotation Schedule** drop-down list, click the close icon (.

Auto key rotation is disabled.

Viewing Key Version Details

To view the details of key versions, expand the **KEY VERSIONS** section. The key version details are displayed.

Adding a Key Version

To add a new key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Add Version**. The Add Version dialog box is displayed.
5. Select a **Method**, the options are **Create New Key** and **Select Existing Key**.
6. Click the desired tab to view the instructions.

Create New Key

- a. Select a **Source**, the options are **CipherTrust (Local)** and **Luna HSM**.
- b. Click the desired tab to view the instructions.

CipherTrust (Local)

Enter **Key Name**.

Luna HSM

- a. Select a **Partition** from the drop-down list.
- b. Enter the **HSM Key Name**.
- c. Select the **Key Type** from the available options. The supported key types are AES and RSA.
- d. Select the **Key Size** from the available options.
- e. Select the **Key Usage** from the available options.

Select Existing Key

- a. Select a **Source**, the options are **CipherTrust (Local)** and **Luna HSM**.
- b. Click the desired tab to view the instructions.

CipherTrust (Local)

Select the desired **Source Key** from the drop-down list.

Luna HSM

- a. Select the **Key Type** from the available options. The supported key types are AES and RSA.

- b. Select the **Key Size** from the available options.
- c. Enter the **HSM Key Name**.

Note

It is not recommended to delete a source key that is being used for cryptographic operations.

7. Click **Add Version**.

Blocking Oracle Keys

You can block a key that belongs to external vaults. To block a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Block**. The Block Key dialog box is displayed.
5. Click **Block Key** to confirm the action.

The key is blocked. The state of the external key changes to Blocked.

Unblocking Oracle Keys

You can unblock a blocked key that belongs to external vaults. To unblock a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Unblock**. The Unblock Key dialog box is displayed.
5. Click **Unblock Key** to confirm the action.

The key is unblocked. The state of the external key changes to Unblocked.

Deleting External Keys

An external key (HYOK) resides on the CipherTrust Manager, it does not require a deletion schedule. The key can be deleted directly from the CipherTrust Manager.

Caution

Before deleting an external key, ensure that the key is not being referred to by the OCI KMS.

To delete an external key from the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Oracle**.
3. Click the overflow icon () corresponding to the key to be deleted.
4. Click **Remove Key**. The Remove Key dialog box is displayed.
5. Click **Remove Key** to confirm the action.

A message stating that the key is removed successfully is displayed.

OCI EKMS Performance Summary

We have tested different environments to capture performance metrics for the CipherTrust Cloud Key Manager (CCKM) Oracle Cloud Infrastructure (OCI) External Key Manager Service (EKMS) integration. The performance results provided within this document demonstrate the effects of deployment choices on throughput for OCI HYOK key encrypt operations for one key. This can help you plan your CipherTrust Manager deployment to meet your performance needs for OCI EKMS integration.

All environments used an open-source [k6.io](#) tool as the REST client to simulate encrypt requests from OCI External Vault. The client ran on a virtual machine with 50 GB system volume, 8 CPUs, and 64 GB of memory.

Note

Actual performance numbers in your environment may be different. The results can vary based on factors, such as how and where the CipherTrust Manager is deployed, CipherTrust Manager resources, the location of cloud KMS, the key source of your choice, the network connectivity between the CipherTrust Manager, OCI Cloud and your key source, as well as how the traffic is load balanced.

Tested Environments

The following deployments were tested:

- CipherTrust Manager as a Key Source
 - Single Node of CipherTrust Manager on Premises, K6 Client on Premises
 - Single Node of CipherTrust Manager on Oracle, K6 Client on Oracle

- Two Clustered CipherTrust Manager Nodes on OCI, K6 Client on OCI
- Single Node of CipherTrust Manager on AWS, K6 Client on OCI
- Single Node of CipherTrust Manager on Premises, K6 Client on CipherTrust Manager, Zero Network Latency
- Luna HSM as a Key Source
 - Single Node of CipherTrust Manager on Premises, K6 client on Premises, Single Node of HSM
 - Single Node of CipherTrust Manager on Premises, K6 Client on Sanjose Lab, HSM in HA Mode
 - Single Node of CipherTrust Manager on Premises, K6 Client on the CipherTrust Manager, Zero Network Latency

The following CipherTrust Manager release version was employed in the tested deployments:

Description	Value
Release version	2.15.0.10938 RC1

Test Process

The test consisted of starting a given number of virtual users to perform encrypt operations on the OCI EKMS/HYOK key. Each user simulated a separate thread.

The total test duration was 40 seconds for each reading. The test was divided into the following increments:

- The ramp-up time was 5 seconds. Virtual users were started.
- The test duration was 30 seconds for each reading. Virtual users make wrap requests during this time.
- Ramp-down time was 5 seconds. Virtual users were stopped until there were zero active virtual users.
- In all environments, the acceptable response latency threshold by OCI is assumed as 100ms. But, for a zero network latency environment, it is assumed as 30ms.

Repeating the test in your environment

We have published the scripts used with `k6 .io` on [Github](#), for you to repeat the tests in your own environments as desired.

OCI EKMS Deployment Results

- CipherTrust Manager as a Key Source
- Luna HSM as a Key Source

CipherTrust Manager as a Key Source

Single Node of CipherTrust Manager on Premises, K6 Client on Premises

This deployment includes the following:

- Single node of CipherTrust Manager on premises
- K6 client on premises

4 CPU 16 GB

Here are the details of this deployment:

CM Details

CM Version	CM Location	Instance Type	CM Configuration	Source
2.15.0.10938 RC1	SanJose Lab	Single Instance	4-CPU, 16GB RAM	CipherTrust Manager

Client Details

OS Type	Location	Client Configuration
Ubuntu-22.04	SanJose Lab	8-CPU, 64GB RAM, 50GB HDD

Results

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time
10	20299	507.43	25
20	21617	540.34	52
30	21849	546.12	79.81
40	21714	542.46	104.91
50	18213	555.26	154.67
60	18507	556.65	182.96

8 CPU 32 GB

Here are the details of this deployment:

CM Details

CM Version	CM Location	Instance Type	CM Configuration	Source
2.15.0.10938 RC1	SanJose Lab	Single Instance	8-CPU, 32GB RAM	CipherTrust Manager

Client Details

OS Type	Location	Client Configuration
Ubuntu-22.04	SanJose Lab	8-CPU, 64GB RAM, 50GB HDD

Results

Number of Virtual Users	Total Operations	Throughput (Ops/Sec)	90% Time

30	50565	1263.22	28.66
35	51783	1295.30	33.71

Conclusion

- The network latency between the K6 client which is simulating traffic from Oracle KMS to CipherTrust Manager affects the performance. In the environments, where the K6 client and the CM are closer geographically or are in the same network, the performance is higher.

- Increasing the number of nodes enhances the performance.

- Increasing CM RAM and CPU increases the performance.

- The number of HSM nodes in HA doesn't affect the throughput.

- In the below two graphs, increasing the CM RAM and CPU improves the performance.

Luna HSM as a Key Source

Single Node of HSM
P(90) = 100ms approx.

Luna HSM as a Key Source

HSM in HA Mode

P(90) = 100ms approx.

- In the below two graphs, increasing the CM RAM and CPU improves the performance. We have considered the threshold 30ms, where the K6 client is running on CM.

- The performance is better when the Key Source is CM as compared to the Luna HSM, where the K6 client is running on CM.

SAP Resources

CCKM supports the SAP Data Custodian cloud.

Prerequisites

Before you can manage SAP resources on CCKM:

1. [Get a Service Admin User Account](#)
2. [Create a New Group](#)
3. [Create an Application Technical User or a Standard User in ISM](#)
4. [Add the Standard User to Key Management Service](#)
5. [Add SAP Connection on CipherTrust Manager](#)

Click each link to view details.

Get a Service Admin User Account

Get a Service Admin user account from SAP. You will be provided service account credentials (a Data Custodian URL, tenant, and username.) These are required to access the Data Custodian system.

To log on to the SAP cloud as the Service Admin:

1. Open the URL for your SAP Data Custodian environment.
2. Enter your tenant name.
3. Click **Continue**.
4. Enter your **Username** and **Password**.
5. Click **Login**.

Next, you need to create a new group.

Create a New Group

Key Management Service groups are used to organize encryption keys and KMS users. Every group is associated with a specific application type, key store provider, key store type, and service tier.

A user with the Key Administrator role in KMS can create new groups.

To create a new group:

1. Log on to the SAP cloud as the Key Admin user.
2. Navigate to **Home > Dashboard**. The Key Management Service Dashboard is displayed.
3. On the **Key Management Service** tab, select an application, for example **General/IAAS Applications**.
4. Click **Create Group**. The Group Details screen is displayed.
5. Specify the group details:
 - a. Specify the **Group Name**.
 - b. Add the **Group Description**.
 - c. (Optional) If applicable, provide the **Landscape** type, **System ID**, and **Tenant**. These fields are optional.
6. Click **Step 2**. The Key Store Selection screen is displayed.
7. Specify the key store details:
 - a. Select **SAP Data Custodian Provided Key Store**.

- b. Select a **Key Store** (for example, AWS, ESK, Azure).
- c. Select the **Key Store Region** where your key store is located.
- d. Click **Review** to verify the group details. Click **Edit** to make any changes.
- e. Click **Create**.

The group is created and its details are displayed. After you have created the group, you need to add a new user to Data Custodian's Identity Service Management (ISM). New Data Custodian users must be added to ISM before they can be added to the Key Management Service.

Create an Application Technical User or a Standard User in ISM

Click the desired tab to view the instructions.

Note

- It is recommended to use Technical Users when creating new connections for SAP Data Custodian on the CipherTrust Manager.
- If you don't use Technical Users when the SAP Data Custodian KMS is integrated with the SAP Cloud Identity Services, the connection to SAP may not work.

User

Add a user to Data Custodian's Identity Service Management (ISM). SAP Data Custodian users with an administrator role in ISM can create new users and edit their service roles.

To add a user in ISM:

1. Log on to the SAP cloud as the Service Admin.
2. Go to top left **Menu > Tenant Management > Users**.
3. Click **Create**.
4. Enter the user's **First Name** and **Last Name**.
5. Enter the user's **Email Address**.
6. Select optional ISM administrator **Roles** to assign to the user.
7. Select an optional **Active Time Range** for the user.
 - a. **Active From**: Allows you to activate the user at a specific time.
 - b. **Active To**: Allows you to deactivate the user at a specific time.

-
8. Click **Review**. Verify the user details. Click **Edit** to make changes, if required.
 9. Click **Create**.

The user is created. Next, you need to add this user to the Key Management Service, as described below.

Technical User

Add an application technical user to Data Custodian's Identity Service Management (ISM). SAP Data Custodian users with a key administrator (Key Admin) role in ISM can create new technical users and edit their permissions.

For more details, refer to the SAP documentation on [Creating an Application Technical User](#).

To add a technical user in ISM:

1. Log on to the SAP cloud as the Key Admin.
2. Go to top left **Menu > Home > Dashboard**.
3. Click the desired application.
4. Click the desired group.
5. On the **Users** tab, click **Technical Users**.
6. Click **Create Technical User**.
7. Enter the **Username** and **Description** (optional), and click **Step 2**.
8. Select an **Active Time Range** and click **Step 3**.

To specify the range:

- a. **Active From**: Allows you to activate the technical user at a specific time. The technical user remains inactive until the **Active From** time is specified.
 - b. **Active To**: Allows you to deactivate the technical user at a specific time.
9. Select the following permissions.
 - View all audit logs for this technical user's group
 - Create Keys
 - Modify Keys
 - Delete Keys
 - Backup and restore keys
 - Manage Labels
 - Read all keys in group
-

- Crypto
- Rotate
- Export all keys in group
- Service Availability Check
- Read Dynamic Key References

10. Click **Review**.
11. Click **Create**.
12. Click **Generate Credential**.
13. Enter **Credential Name**, select **Expiry Date** (optional).
14. Ensure that **Activate Now** is set to **NO**.

Warning

If **Activate Now** is set to **YES**, a connection using this Technical User's credentials cannot be created. You will keep getting the error, "Credential must only be refreshed once".

15. Click **Download**.

The credentials (access key, secret key, and API endpoints) are downloaded in a ZIP file named **<credential-name>.zip**. These credentials are needed to create a SAP connection on the CipherTrust Manager. It is recommended to use the latest API endpoint URL listed in the extracted **API endpoints.txt** file. Refer to [Add SAP Connection on CipherTrust Manager](#) for details.

Note

Connection Test Behavior

When you use a Technical User's credentials to create the SAP connection on CipherTrust Manager:

1. The **Test Connection** during the creation process will fail. This is expected as the credential is not yet active.
2. Proceed to save the connection without a successful test.
3. After the connection is created, find it in the Connections list and perform a **Test Connection** on it. This second test will succeed and activate the Technical User credential.

Standard User

Add a standard user to Data Custodian's Identity Service Management (ISM). SAP Data Custodian users with an administrator role in ISM can create new users and edit their service roles.

To add a user in ISM:

1. Log on to the SAP cloud as the Service Admin.
2. Go to top left **Menu > Tenant Management > Users**.
3. Click **Create**.
4. Enter the user's **First Name** and **Last Name**.
5. Enter the user's **Email Address**.
6. Select optional ISM administrator **Roles** to assign to the user.
7. Select an optional **Active Time Range** for the user.
 - a. **Active From**: Allows you to activate the user at a specific time.
 - b. **Active To**: Allows you to deactivate the user at a specific time.
8. Click **Review**. Verify the user details. Click **Edit** to make changes, if required.
9. Click **Create**.

The user is created. Next, you need to add this user to the Key Management Service, as described below.

Add the Standard User to Key Management Service

Note

This section is applicable to standard (non-technical) SAP users. Skip the section when adding SAP Technical Users.

Add the user created in the previous step to the Key Management Service. Only the Key Management Service users with an Administrator role can add other users to KMS.

To add the user to the Key Administrator service:

1. Navigate to **Tenant Management > Users**.
2. From the **All Users** section, select the user (created [above](#)).
3. Click **Add to Service**. You might need to open the menu on the top-right, to see this button.

4. Select **Key Management Service (KMS)**.
5. Select the **Key Administrator** role to assign to the user. The user with the Key Administrator role is referred to as the Key Admin user in this document.

Note

Optionally, assign one or more existing groups to the user. Refer to [User Roles in the Key Management Service](#) in SAP documentation for more information.

6. Click **Add**.

After assigning the Key Administrator role to the user, add SAP connection on CipherTrust Manager.

Add SAP Connection on CipherTrust Manager

Before you can add a SAP group to the CCKM, a connection to your SAP account must already exist on the CipherTrust Manager. After you have created a SAP group, add a connection to the SAP cloud using your SAP tenant and the Key Admin username and password.

A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connection Manager](#) for details.

What Next?

After completing the prerequisites, you can view linked SAP groups and manage keys on the CipherTrust Manager.

Refer to the following sections:

- [Managing SAP Groups](#)
- [Managing SAP Keys](#)
- [Scheduling Operations](#)
- [Managing SAP Reports](#)
- [Viewing Linked SAP Applications](#)
- [Downloading SAP Metadata](#)

Managing SAP Groups

This section describes how to manage SAP groups on CCKM. Before proceeding, a connection to your SAP account must exist on the CipherTrust Manager. Refer to [Connection Manager](#) for details.

After the connection is configured, you can add groups to the CipherTrust Manager. SAP groups can be added,

viewed, modified, or deleted on the SAP Data Custodian Groups page.

Adding Existing SAP Groups

You can add existing groups linked to a SAP connection to the CipherTrust Manager. An existing group can only be added just once.

To add an existing SAP group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**. The Groups tab of the SAP Data Custodian Groups page is displayed.
3. Click **Add Existing Groups**. The Select Connection tab of the Add SAP Data Custodian Group screen is displayed.
4. Select the desired **Connection** from the list.
5. Click **Next**. The Add SAP Data Custodian Group tab is displayed. You will see the list of existing groups linked with the selected connection.
6. Under **Group Name**, select the desired groups.
7. Click **Save**.

The selected group is displayed on the SAP Data Custodian Groups page. Now, you can manage the group from CCKM on the CipherTrust Manager.

The group is available to [upload SAP keys](#) and [view SAP reports](#).

Viewing SAP Data Custodian Groups

The Groups tab of the SAP Data Custodian Groups page shows the list of groups added to the CipherTrust Manager. Search for the groups by Group Name, Created By, or Region.

To view the list of groups added to the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**. The Groups tab of the SAP Data Custodian Groups page shows the list of groups added to the CipherTrust Manager.

The page displays the following details:

Column	Description
Group Name	Name of the group.
Keystore Provider	Name of the keystore provider. The provider can be: • ESK

Column	Description
	• AWS • AZURE • THALES
Keystore	Name of the keystore.
Key Management Service	Name of the key management service. The service can be: • Software KMS • Software HYOK
Region	Region of the group.
Application	Name of the SAP application.
Connection	Name of the SAP connection added to the CipherTrust Manager.
Created By	Name of the SAP user who created the group.
Tenant	Name of the SAP tenant. For SAP Technical Users (TUs), the field remains blank.
Last Refreshed	Date and time when the group was refreshed the last.

To view/hide columns, click the Customize View (⚙️) icon, select/clear the desired option, and click **OK** to display the column.

Refreshing SAP Groups

Refreshing is the process to download keys created in SAP groups to the CCKM. You can refresh keys from individual or all SAP groups.

- Refreshing Specific SAP Groups
- Refreshing All SAP Groups

Refreshing Specific SAP Groups

To refresh a group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**.
3. On the Groups tab, click the overflow icon (⋮) corresponding to the desired group and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > SAP > SAP Keys** page. Refer to [Viewing SAP Keys](#) for details.

Refreshing All SAP Groups

To refresh all SAP groups:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**.
3. On the Groups tab, click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all groups is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > SAP > SAP Keys** page. Refer to [Viewing SAP Keys](#) for details.

Viewing Details of a Group

To view the details of a group on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**.
3. On the Groups tab, click the **Group Name** link of the desired group.

Alternatively, click the overflow icon () corresponding to the desired group, and click **View/Edit Details**.

The edit view of the SAP Data Custodian Groups page shows additional details of the selected group under the ACCESS CONTROL and GENERAL INFO sections. Expand each section to view more details.

Changing the SAP Connection

To change the SAP connection of a group:

1. Expand **GENERAL INFO**.
2. From the **Connection ID** drop-down list, select the SAP connection.

3. Click **Update**.

The connection of the SAP group is changed.

Managing User Permissions on SAP Groups

To work with the SAP cloud, users/groups must have the minimum set of permissions that allow them to use the SAP resources such as keys and groups. Initially, the CCKM user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on SAP groups.

Users with the following characteristics can perform operations for SAP keys and SAP groups:

- Users in the **CCKM Admins** group
- Users in the **Admin** group
- Users who are administrators for a **domain**
- Users who are in the **CCKM Users** group and which have had a CCKM Admin assign permissions through the UI or the `/v1/cckm/sap/groups/{id}/update-acls` endpoint in the REST API.

Adding Permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**.
3. On the Groups tab, click the **Group Name** link of the desired group.

Alternatively, click the overflow icon () corresponding to the desired group, and click **View/Edit**.

4. Expand the **ACCESS CONTROL** section.
5. Click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
6. Select the desired user or group from the **User/Group** drop-down list.
7. Click **Save**.

The newly added user/group is displayed under **Name** in the **ACCESS CONTROL** section. You can now grant additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Allowed Operations

CCKM allows the following operations on SAP groups:

- View Keys, Add Native Key, Add BYOK Key, Edit Key
- Rotate Key, Delete Key, Delete Key Backup, Remove Key, Restore Key
- Rotate to Native Key, Rotate to BYOK Key, Synchronize Key

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the ACCESS CONTROL section, select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a Permission

To remove a permission assigned to a user or group:

1. In the ACCESS CONTROL section, clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the ACCESS CONTROL section, under **Unassign**, click the **X** button corresponding to the desired user/group.
2. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

3. Click **Remove** to confirm the action. To cancel the action, click **Keep It**.

A success message is displayed on the screen.

Removing SAP Groups

SAP groups can be removed on the SAP Data Custodian Groups page. Search for existing groups using Group Name or Created By.

To remove a group from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**.
3. On the Groups tab, click the overflow icon () corresponding to the group you want to remove.
4. Click **Delete**.
5. Select **I wish to delete the SAP Group**.
6. Click **Delete**.

The SAP group is deleted successfully. The group is removed from the list of SAP Data Custodian groups.

Managing SAP Keys

This section describes how to manage SAP keys on CCKM. Before proceeding, you must have a SAP Data Custodian group added to the CCKM. Refer to [Managing SAP Groups](#) for details.

- [Key Creation Methods and Sources](#)

Key Creation Methods and Sources

Methods to create SAP cloud keys using CCKM are:

- **Creating/Uploading New Key Material:** Add key material by creating and uploading new source key or creating new native key. The key source can be:
 - **CipherTrust (External):** A new key is first created on the external CipherTrust Manager. Then, this key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CipherTrust (External)**.
 - **CipherTrust (Local):** A new key is first created on the CipherTrust Manager. Then, this key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **SAP (Native):** A new key is directly created on SAP cloud using a native SAP application. The key origin is **NATIVE**.
 - **Vormetric DSM:** A new DSM key is first created on the CipherTrust Manager. Then, this key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **Luna HSM:** A new Luna HSM key is first created on the CipherTrust Manager. Then, this key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

- **Cloning Existing Key Material:** Clone key material from an existing key to create a new key. The key source can be:
 - **CipherTrust (Local):** An existing local CipherTrust Manager key is first cloned on the CipherTrust Manager.

Then, the cloned key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.

- **CipherTrust (External):** An existing key is first cloned on the external CipherTrust Manager. Then, this key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CipherTrust (External)**.
- **Vormetric DSM:** An existing DSM key is first cloned on the CipherTrust Manager. Then, the key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
- **Luna HSM:** An existing Luna HSM key is first cloned on the CipherTrust Manager. Then, the key material is uploaded to SAP cloud to create a new SAP key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Supported Key Types and Sizes for Key Stores

The following key types and sizes/curves are supported for AWS keystore.

Size/Curve	Native	BYOK
AES	256	256, applicable to all the key materials.
RSA	2048, 3072, and 4096	2048, 3072, and 4096. Applicable to all the key materials.
EC	ECC_NIST_P256 (SECP256R1, PRIME256V1), ECC_NIST_P384 (SECP384R1), ECC_NIST_P521 (SECP521R1), and ECC_SECG_P256K1 (SECP256K1). Applicable to asymmetric keys only.	ECC_NIST_P256 (SECP256R1, PRIME256V1), ECC_NIST_P384 (SECP384R1), ECC_NIST_P521 (SECP521R1), and ECC_SECG_P256K1 (SECP256K1). Applicable to CipherTrust (External) and CipherTrust (Local) key materials.

If a SAP group has an AWS keystore, you cannot export the key.

The following key types and sizes/curves are supported for the ESK keystore.

Size/Curve	Native	BYOK
AES	128, 192, and 256	128, 192, and 256. 192 is not applicable to DSM key material.

Size/Curve	Native	BYOK
RSA	2048, 3072, 4096, and 8192	2048, 3072, and 4096. For Luna HSM, you can also select 8192.
EC	SECP192K1, SECP224K1, SECP256K1, NISTP192, NISTP224, NISTP256, NISTP384, and NISTP521	ECC_SECG_P224K1 (SECP224K1), ECC_SECG_P256K1 (SECP256K1), ECC_NIST_P224 (SECP224R1), ECC_NIST_P256 (PRIME256V1), ECC_NIST_P384 (SECP384R1), and ECC_NIST_P521 (SECP521R1). Applicable to CipherTrust (External) and CipherTrust (Local) key materials.

Creating/Uploading New Key Material

To add a SAP cloud key by creating/uploading new key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click **Add Key**. The Select Material Origin screen of the Add SAP Key wizard is displayed.
4. Under **Select Method**, select **Create/Upload New Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following:
 - **CipherTrust (External)**: Refer to [Uploading CipherTrust \(External\) Key Material](#) for details.
 - **CipherTrust (Local)**: Refer to [Uploading CipherTrust \(Local\) Key Material](#) for details.
 - **SAP (Native)**: Refer to [Creating SAP \(Native\) Key Material](#) for details.
 - **Luna HSM**: Refer to [Uploading Luna HSM Key Material](#) for details.
 - **Vormetric DSM**: Refer to [Uploading Vormetric DSM Key Material](#) for details.

Refer to [Key Creation Methods and Sources](#) for details on key sources.

Refer to [Supported Key Types and Sizes for Key Stores](#) for key store support information.

Uploading CipherTrust (External) Key Material

Upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (External)**.

2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Configure CipherTrust (External) Key screen is displayed.

Configure CipherTrust (External) Key

1. **Select Domain** from the drop-down list. The drop-down list shows the external CM domains linked with the configured external CM connection.
2. Enter a **Key Name**. A new key with this name will be created on the CipherTrust Manager and its key material will be uploaded to SAP cloud.
3. Select the **Algorithm** for the key. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
 - **EC**: Creates and uploads an EC key.
4. Select the **Key Size / Elliptic Curve** based on the key type.

Note

- If you are creating a master/primary key, you must select RSA as the key type, and 3072 or 4096 as the key size.
- For AES as the algorithm, you do not need to select a key size.

5. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. (Optional) Provide a basic **Description** for the key.
2. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

3. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

4. Select the **Key Attributes**. The options are:

- Encrypt, Decrypt, Sign
- Verify, Wrap, Unwrap

Note

- For *EC* keys, only Sign and Verify are available. For *AES* keys, Sign and Verify are not available.
- For a master/primary key, you must select Encrypt and Decrypt as the key attributes.

- Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

- Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

- Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

- Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Uploading CipherTrust (Local) Key Material

Upload the local key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

- Select **CipherTrust (Local)**.
- Click **Next**. The Select Group screen is displayed.

Select Group

- Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning

- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Configure CipherTrust Key screen is displayed.

Configure CipherTrust (Local) Key

1. Enter a **Key Name**. A new key with this name will be created on the CipherTrust Manager and its key material will be uploaded to SAP cloud.
2. Select **Key Type**. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
 - **EC**: Creates and uploads an EC key.
3. Select the **Key Size / Elliptic Curve** based on the [key type](#).

Note

If you are creating a master/primary key, you must select RSA as the key type, and 3072 or 4096 as the key size.

4. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. (Optional) Provide a basic **Description** for the key.
2. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

3. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

4. Select the **Key Attributes**. The options are:

- Encrypt, Decrypt, Sign
- Verify, Wrap, Unwrap

Note

- For *EC* keys, only Sign and Verify are available. For *AES* keys, Sign and Verify are not available.
- For a master/primary key, you must select Encrypt and Decrypt as the key attributes.

5. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window

open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Creating SAP (Native) Key Material

Create the key material directly using a native SAP application.

Select Material Origin > Select Source

1. Select **SAP (Native)**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. Enter a unique, user-friendly alias as the **SAP Key Name**. This will be the key name on SAP cloud. This name helps uniquely identify a SAP key.

2. (Optional) Provide a basic **Description** for the key.
3. Select **Key Type**. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
 - **EC**: Creates and uploads an EC key.
4. Select the **Key Size / Elliptic Curve** based on the [key type](#).

Note

The key size 8192 is applicable to a non-FIPS Luna HSM.

Note

If you are creating a master/primary key, you must select RSA as the key type, and 3072, 4096, or 8192 as the key size.

5. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

6. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

7. Select the **Key Attributes**. The options are:
 - Encrypt, Decrypt, Sign

- Verify, Wrap, Unwrap

Note

- For *EC* keys, only Sign and Verify are available. For *AES* keys, Sign and Verify are not available.
- For a master/primary key, you must select Encrypt and Decrypt as the key attributes.

8. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, and NATIVE KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **NATIVE KEY** or **SELECT GROUP** section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the NATIVE KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys. The origin of the key is **NATIVE**.

Uploading Vormetric DSM Key Material

Upload the local key material using the Vormetric DSM to configure the source key.

Select Material Origin > Select Source

1. Select **Vormetric DSM**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Configure DSM Key screen is displayed.

Configure DSM Key

1. Enter a **DSM Key Name**. A new key with this name will be created on the DSM and its key material will be uploaded to SAP cloud.
2. (Optional) Provide a **Description** for the key.
3. Select a **DSM Domain** for the key. The drop-down list shows the DSM domains linked with the configured DSM connection.
4. Select **Key Type**. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
5. Select the **Key Size** based on the [key type](#).
6. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. (Optional) Provide a basic **Description** for the key.
2. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

3. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

4. Select the **Key Attributes**. The options are:

- Encrypt, Decrypt, Sign
- Verify, Wrap, Unwrap

Note

- For AES keys, Sign and Verify are not available.
- For a master/primary key, you must select Encrypt and Decrypt as the key attributes.

5. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window

open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Uploading Luna HSM Key Material

Upload the local key material using the Luna HSM to configure the source key.

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Select Material Origin > Select Source

1. Select **CipherTrust Luna HSM**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors

- Analytics Cloud

2. Click **Next**. The Configure HSM Key screen is displayed.

Configure HSM Key

1. Select the **Partition ID** of the desired Luna HSM partition.
2. Enter an **HSM Key Name**. A new key with this name will be created on the Luna HSM and its key material will be uploaded to SAP cloud.
3. Select the **Key Type** for the key. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
4. Select the **Key Size** based on the [key type](#).

Note

If you are creating a master/primary key, you must select RSA as the key type, and 3072, 4096, or 8192 as the key size.

5. (Applicable to RSA algorithm only) Select the key **Mechanism**. The supported key mechanisms are:
 - CKM_RSA_FIPS_186_3_AUX_PRIME_KEY_PAIR_GEN
 - CKM_RSA_X9_31_KEY_PAIR_GEN
 - CKM_RSA_FIPS_186_3_PRIME_KEY_PAIR_GEN
 - CKM_RSA_PKCS_KEY_PAIR_GEN

Note

The mechanism for the AES algorithm is CKM_AES_KEY_GEN.

6. Select the **Key Attributes**. The options are:
 - Modifiable, Extractable, Sensitive (all *three* are selected for a **BYOK Compatible** key)

- Encrypt, Decrypt, Wrap, Unwrap
- Sign, Verify, Derive

7. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. (Optional) Provide a basic **Description** for the key.
2. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

3. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

4. Select the **Key Attributes**. The options are:

- Encrypt, Decrypt, Sign
- Verify, Wrap, Unwrap

Note

For a master/primary key, you must select Encrypt and Decrypt as the key attributes.

5. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Cloning Existing Key Material

To add a new SAP cloud key by cloning key material existing on the CipherTrust Manager (External), CipherTrust Manager (Local), DSM, or Luna HSM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click **Add Key**. The Select Material Origin screen of the Add SAP Key wizard is displayed.
4. Under **Select Method**, select **Clone Existing Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following:
 - **CipherTrust (External)**: Refer to [Cloning CipherTrust \(External\) Key Material](#) for details.
 - **CipherTrust (Local)**: Refer to [Cloning CipherTrust \(Local\) Key Material](#) for details.
 - **Vormetric DSM**: Refer to [Cloning Vormetric DSM Key Material](#) for details.
 - **Luna HSM**: Refer to [Cloning Luna HSM Key Material](#) for details.

Refer to [Key Creation Methods and Sources](#) for details on these key sources.

Cloning CipherTrust (External) Key Material

Clone and upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (External)**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Select CipherTrust (External) Key screen is displayed.

Select CipherTrust (External) Key

1. **Select Domain** from the drop-down list. The drop-down list shows the external CM domains linked with the configured external CM connection.
2. Select the **Algorithm** for the key. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
 - **EC**: Creates and uploads an EC key.
3. Select the **Key Size / Elliptic Curve** based on the [key type](#).
4. Select the desired key from the **Key Name** drop-down list. This field shows the available local CipherTrust Manager keys.
5. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. Enter a unique, user-friendly alias as the **SAP Key Name**. This will be the key name on SAP cloud. This name

helps uniquely identify a SAP key. By default, the CipherTrust Key Name you specified on the previous screen is populated.

2. (Optional) Provide a basic **Description** for the key.
3. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

4. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

5. Select the **Key Attributes**. The options are:

- Encrypt, Decrypt, Sign
- Verify, Wrap, Unwrap

Note

For *EC* keys, only Sign and Verify are available. For *AES* keys, Sign and Verify are not available.

6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as

appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Cloning CipherTrust (Local) Key Material

Clone and upload the local key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Select CipherTrust (Local) Key is displayed.

Select CipherTrust (Local) Key

1. Select **Key Type**. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
 - **EC**: Creates and uploads an EC key.
2. Select the **Key Size / Elliptic Curve** based on the [key type](#).
3. Select the desired key from the **Key Name** drop-down list. This field shows the available local CipherTrust Manager keys.
4. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. Enter a unique, user-friendly alias as the **SAP Key Name**. This will be the key name on SAP cloud. This name helps uniquely identify a SAP key. By default, the CipherTrust Key Name you specified on the previous screen is populated.
2. Select the desired **SAP Group Name** from the drop-down list. The drop-down shows the list of SAP groups added to the CCKM.
3. (Optional) Provide a basic **Description** for the key.
4. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

5. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

6. Select the **Key Attributes**. The options are:
 - Encrypt, Decrypt, Sign

- Verify, Wrap, Unwrap

Note

For *EC* keys, only Sign and Verify are available. For *AES* keys, Sign and Verify are not available.

7. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Cloning Vormetric DSM Key Material

Clone and upload the local key material using the Vormetric DSM to configure the source key.

Select Material Origin > Select Source

1. Select **Vormetric DSM**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

2. Click **Next**. The Select DSM Key screen is displayed.

Select DSM Key

1. Select **Key Type**. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
2. Select the **Key Size** based on the [key type](#).
3. Select the desired key from the **DSM Key Name** drop-down list. This field displays the available DSM keys.
4. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. Enter a unique, user-friendly alias as the **SAP Key Name**. This will be the key name on SAP cloud. This name helps uniquely identify a SAP key. By default, the DSM Key Name you specified on the previous screen is populated.
2. (Optional) Provide a basic **Description** for the key.
3. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

4. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

5. Select the **Key Attributes**. The options are:

- Encrypt, Decrypt, Sign
- Verify, Wrap, Unwrap

Note

For AES keys, Sign and Verify are not available.

6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Cloning Luna HSM Key Material

Note

The Functionality Module (FM) configuration on the Luna Network HSM is not compatible with CipherTrust Manager integrations.

Clone and upload the local key material using the Luna HSM to configure the source key.

Select Material Origin > Select Source

1. Select **Luna HSM**.
2. Click **Next**. The Select Group screen is displayed.

Select Group

1. Select a **Group** from the list.

Note

If you are creating a master/primary key, you must select a group that allows you to create a master/primary key. The following groups are supported.

- S4/HANA
- Integrated Business Planning
- SAP Commissions
- HANA Enterprise Cloud
- SAP Marketing Cloud
- SuccessFactors
- Analytics Cloud

-
2. Click **Next**. The Select HSM Key screen is displayed.

Select HSM Key

1. Select the **Partition ID** of the desired Luna HSM partition.
2. Select the **Algorithm** (key type) for the key. The options are:
 - **AES**: Creates and uploads an AES key.
 - **RSA**: Creates and uploads an RSA key pair.
3. Select the **Key Size** based on the [key type](#).
4. Select the desired **HSM Key** key from the list.
5. Click **Next**. The Configure SAP Key screen is displayed.

Configure SAP Key

1. Enter a unique, user-friendly alias as the **SAP Key Name**. This will be the key name on SAP cloud. This name helps uniquely identify a SAP key. By default, the HSM Key Name you specified on the previous screen is populated.
2. (Optional) Provide a basic **Description** for the key.
3. (To create a master/primary key) Select **Create as Master/Primary key**.

Note

You can create only one master/primary key for a group. If a master/primary key already exists for the selected group, you can't select **Create as Master/Primary key**.

4. (Optional) Select **Allow Key Export**. Selecting this check box allows the key to be exported.

Note

You can only export the keys in a group that belongs to an ESK keystore.

5. Select the **Key Attributes**. The options are:
 - Encrypt, Decrypt, Sign
 - Verify, Wrap, Unwrap

6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SELECT GROUP, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SELECT GROUP**, **SOURCE KEY**, and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add SAP Key wizard is closed.

The newly created key is displayed in the list of SAP keys.

Viewing SAP Keys

The SAP Keys page shows the list of SAP cloud keys available on the CipherTrust Manager.

To view the SAP keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**. The list of available SAP keys is displayed. The SAP Keys page displays the following details:

Field	Description
Key Name	Unique, user-friendly name of the SAP key. Click the link to view additional details of the key or edit the key. Refer to Viewing or Editing Details of SAP Keys . This name is useful in searching for specific keys.
Algorithm	Algorithm of the SAP key. AES, RSA, and EC algorithms with different keys sizes and elliptic curves are supported.
Status	State of the SAP key. The status can be: • Available

Field	Description
	• Not Available • Deleted
Key State	State of the SAP key. The status can be Enabled or Disabled.
Created By	Name of the user who created the key. Note: SAP excludes the creator identifiable fields from the API responses for the technical users. If the connection to the SAP Data Custodian is established by a technical user, this field will be blank.
Version Count	Number of key versions.
Creation Date	Date and time when the SAP key is created.
Operations	Operations allowed using the SAP key.
Group	SAP group where the SAP key resides.
Version	Version of the key.
Origin	Source of the key material used for the version. The origin can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud. Refer to Key Creation Methods and Sources for details.
Application	SAP application (for example, SAP S/4HANA Cloud) where the key is used.
Tenant	SAP tenant in which the key is created.
Allow Key Export	Whether the key export is allowed. The setting can be: • Enabled: The key export is allowed. • Disabled: The key export is not allowed.

The **Operations**, **Group**, **Version**, **Origin**, **Application**, **Tenant**, and **Allow Key Export** columns are hidden by default. To show/hide a column, click the custom view icon (⚙️), select/clear the desired column, and click **OK**.

Refreshing SAP Keys

Refreshing is the process of downloading keys created in SAP groups to CCKM. You can refresh keys from all SAP groups at once.

To refresh all keys:

1. Open the Cloud Key Manager application.
2. In the left pane, click **Cloud Keys > SAP**. The SAP Keys page is displayed. This page displays the list of SAP keys.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all keys is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message Refresh started... is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > SAP > SAP Keys** page.

Viewing Versions of a Key

To view the versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the expand icon () to the left of the desired key. The key versions are displayed.

Disabling a SAP Key

If required, you can disable an enabled key. A disabled key cannot operate on data. Disabling a key disables all versions of the key.

To disable a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the overflow icon () corresponding to the desired key.

-
4. Click **Disable**. The Disable Key dialog box is displayed.
 5. Click **Disable** to confirm the action.

The state of the key changes to Disabled.

Enabling a SAP Key

If required, you can enable a disabled key. Enabling a key enables all versions of the key.

To enable a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Enable**. The Enable Key dialog box is displayed.
5. Click **Enable** to confirm the action.

The state of the key changes to Enabled.

Adding a Key Version

CCKM provides two methods to add a new version to a key. Refer to [Key Creation Methods and Sources](#) for details on key creation methods and key sources.

To add a new key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Add Version**. The Add Version dialog box is displayed.
5. **Select Method**. The options are:
 - **Create/Upload New Key Material**: Refer to [Adding Key Version by Creating/Uploading Key Material](#).
 - **Clone Existing Key Material**: Refer to [Adding Key Version by Cloning Existing Key Material](#).

Adding Key Version by Creating New Key Material

1. Select **Create/Upload New Key Material** as the method.
2. **Select Source**. The options are:

- **CipherTrust (External):** Select this option, select the **Domain Name**, and specify a **Key Name** for the new key version.
- **CipherTrust (Local):** Select this option and specify **Key Name** for the new key version.
- **SAP (Native):** Select this option to create a new native SAP key.
- **Vormetric DSM:** Select this option, specify **Key Name** for the new key version and select the **DSM Domain**.
- **Luna HSM:** Select this option, select the **Partition ID**, select **Key Attributes**, and specify **Key Name** for the new key version.

The key attributes Modifiable, Extractable, and Sensitive are selected for a **BYOK Compatible** key.

3. Click **Add Version**.

A new version is added to the key. The Version Count increases by one on the SAP Keys page.

Adding Key Version by Cloning Existing Key Material

1. Select **Clone Existing Key Material** as the method.
2. **Select Source.** The options are:
 - **CipherTrust (External):** Select this option and **Select a source key** for the new key version.
 - **CipherTrust (Local):** Select this option and **Select a key source** for the new key version.
 - **Vormetric DSM:** Select this option and **Select a key source** for the new key version.
 - **Luna HSM:** Select this option and **Select a key source** for the new key version.
3. Click **Next**. The Select Source Key and Add Version screen is displayed.

Select Source Key and Add Version

1. (Optional, applicable to CipherTrust (Local) Key only) Enable **Fetch Latest Version Only**.
2. Select the desired key from the **Key Name** list.
3. Click **Add Version**.

A new version is added to the key. The Version Count increases by one on the SAP Keys page.

Deleting a SAP Key

If no longer required, you can delete a key. The delete operation deletes the key from SAP cloud.

Deleting a Non Exportable Key

Deletion of a non exportable key is irrecoverable. Because the key is not exportable, CCKM cannot back up this key, so it cannot be restored after deletion.

To delete a non exportable key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the overflow icon () corresponding to the desired key.
4. Click **Delete**. The Remove dialog box is displayed.

Warning

This will delete the key from SAP. This operation is not recoverable. Because the key is not exportable, CCKM is unable to backup this key, so it cannot be restored after deletion. Are you sure you want to delete the key?

5. Click **Delete**. The Delete Key dialog box is displayed. It shows the name of the key being deleted in **bold**.

This dialog box acts as a secondary confirmation so that you are aware of the consequences of the delete operation.

6. Type the name of the key to be deleted. When the typed key name matches the given key name, the Delete button is enabled.
7. Click **Delete** to confirm the deletion. To cancel the key deletion, click **Cancel**.

A message stating that delete key is in progress is displayed. After the key is deleted successfully, it is removed from the list of SAP keys.

Deleting an Exportable Key

When deleting an exportable key, you have the option to proceed with the key deletion even if the key backup fails. If you select this option, CCKM will automatically take a fresh backup of the key before deleting it. If the backup process fails, it will proceed with deleting the key anyway. This may mean the key cannot be restored to its current state.

To delete an exportable key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the overflow icon () corresponding to the desired key.

- Click **Delete**. The Delete Key dialog box is displayed.
- (Optional) Select **Delete even if backup fails**.

Note

If you select this option, CCKM will automatically take a fresh backup of the key before deleting it. If the backup process fails, it will proceed with deleting the key anyway. This may mean the key cannot be restored to its current state.

- Click **Delete**. The Delete Key dialog box is displayed. It shows the name of the key being deleted in **bold**.

This dialog box acts as a secondary confirmation so that you are aware of the consequences of the delete operation.

- Type the name of the key to be deleted. When the typed key name matches the given key name, the Delete button is enabled.
- Click **Delete** to confirm the deletion. To cancel the key deletion, click **Cancel**.

A message stating that delete key is in progress is displayed. After the key is deleted successfully, it is removed from the list of SAP keys.

Deleting a Master/Primary Key

To delete a master/primary key:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Cloud Keys > SAP**.
- Click the overflow icon () corresponding to the master/primary key.
- Click **Delete**. The Delete Master/Primary Key dialog box is displayed.
- (Optional) Select **Delete even if backup fails**.

Note

If you select this option, CCKM will automatically take a fresh backup of the key before deleting it. If the backup process fails, it will proceed with deleting the key anyway. This may mean the key cannot be restored to its current state.

- Click **Yes**.

7. For confirmation, enter the **full name of the master/primary key** you want to delete.
8. Select the following.
 - Data encrypted with a key may no longer be accessible once the key is deleted.
 - Key deletion cannot be reversed unless the key has been fully backed up.
 - I have read and acknowledge the consequences of key deletion.
9. Click **Delete** to confirm the deletion. To cancel the key deletion, click **Cancel**.

A message stating that the delete key is in progress is displayed. After the key is deleted successfully, it is removed from the list of SAP keys.

Removing a SAP Key

After the key is deleted, you can remove it from the CCKM. To remove the key.

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**.
3. Click the overflow icon () corresponding to the desired deleted key.
4. Click **Remove**. The Remove dialog box is displayed.
5. (Applicable to master/primary keys) Select an option to remove the key. You can select either **Remove Key Backup** or **Remove Key Backup and Metadata**.
6. Click **Next**.
7. Enter the **key name**.
8. Click **Remove**.

You will see a message that the key is removed successfully.

Viewing or Editing Details of SAP Keys

After a key is created, you can update key name and description, change exportability, and modify key attributes.

In the edit view of a key, you can view all the key details such as its purpose, protection level, and location etc.

To view or edit an SAP key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**. The list of available SAP keys is displayed.
3. Click the overflow icon () corresponding to the desired key and click **View/Edit**. Alternatively, you can click

the key name link. The edit view of the key is displayed. The edit view is divided into:

- **GENERAL INFO:** View and update key name and its description (refer to [Changing Key Details](#)). Also, you can change the exportability of the key (refer to [Changing Key Exportability](#)) and key attributes (refer to [Changing Key Attributes](#)).
- **KEY SCHEDULE:** Add, update, and disable a key rotation schedule. Refer to [Adding or Changing Key Rotation Schedule](#) and [Disabling Key Rotation Schedule](#).
- **KEY VERSIONS:** View details of key versions. Refer to [Viewing Key Version Details](#).

Changing Key Details

To modify the key details:

1. Expand the **GENERAL INFO** section, if needed.
2. Update the **SAP Key Name**.
3. Add or update **Description**.
4. Click **Update**.

The key details are updated.

Changing Key Exportability

To change key exportability:

1. Expand the **GENERAL INFO** section, if needed.
2. Clear or select **Allow Key Export**.
 - Select the check box to allow the key export.
 - Clear the check box to prevent the key export.

When Allow Key Export is disabled, the CipherTrust Manager cannot back up the key.

3. Click **Update**.

The key exportability is changed.

Changing Key Attributes

To modify key attributes:

1. Expand the **GENERAL INFO** section.
2. Under **Key Attributes**, select or clear the desired attributes.

3. Click **Update**.

The key attributes are updated.

Adding or Changing Key Rotation Schedule

To add or update a key rotation schedule:

1. Expand the KEY SCHEDULE section.
2. From **Select Rotation Schedule** drop-down list, select the desired schedule.
3. Select the **Key Origin**. The options are:
 - CipherTrust (External)
 - CipherTrust (Local)
 - Native
 - Luna, also select the Luna HSM **Partition**.
 - DSM, also select the DSM **Domain**.
4. Click **Update**.

The key rotation schedule is added/updated. The selected schedule is now assigned to the key. To view all the keys assigned to a schedule, refer to [Viewing Keys Assigned to Schedules](#).

Disabling Key Rotation Schedule

To disable a key rotation schedule:

1. Expand the KEY SCHEDULE section.
2. Next to the **Key Rotation Schedule** drop-down list, click the close icon ().

Auto key rotation is disabled.

Viewing Key Version Details

To view the details of key versions, expand the KEY VERSIONS section. The key version details are displayed:

Field	Description
Version	Version number of the key.
Key State	State of the key version. The state can be enabled or disabled.
Created By	User who created the key.

Field	Description
Creation Date	Date and time when the SAP key is created.
Operations	Operations allowed using the SAP key.
Source Key	Source key for the version.
Origin	Source of the key material. The origin of the key can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud.

Scheduling Operations

CCKM allows you to periodically refresh or rotate keys in the background. To refresh or rotate keys, you need to create schedule configuration. A schedule configuration defines when to run a refresh or rotation job. You can use either basic format or cron format to specify the time when the rotation or refresh job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- Repeats: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- at: specific time at which the rotation or refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

" * * * * * "

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. **Select Schedule Type as Key Rotation.**
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **SAP** from the **Cloud Name** drop-down list.
 - (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
 - (Optional) Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.
 - b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created schedule is displayed in the schedules list.

Adding Key Refresh Schedule

A key refresh schedule synchronizes keys from linked SAP groups to Cloud Key Manager.

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
-

-
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
 3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
 4. **Select Schedule Type** as **Key Refresh**.
 5. Click **Next**.
 6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **SAP** from the **Cloud Name** drop-down list.
 - (Optional) Add **Description** for the scheduler in a maximum of 250 characters.
 - (Optional) Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
 7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.
 - b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
 - c. Click **Next**.
 8. On the **Add Groups** screen:
 - a. Select the desired group from the **Refresh Keys from Selected Group(s)** drop-down list.
 - b. Click **+** button. Similarly, you can add more groups. To remove an added group, click the close (X) icon in the name of the group.

Alternatively, if you want to refresh all the existing groups, select the **Refresh All Groups** check box. When selected, the **Refresh Keys from Selected Group(s)** field becomes unavailable.

 - c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created scheduled is displayed in the schedules list.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays the following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only)
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Start time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration. Never is displayed if the schedule is set to never expire.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

Alternatively, click the **Name** link corresponding to the desired schedule.

4. Edit or configure the following information:

- **GENERAL INFO:**

- Basic description of the schedule.
- Status of the scheduler configuration. Select **Enable Schedule** to enable the schedule, clear to disable.

- **SCHEDULE CONFIG:** Scheduler configuration parameters such as duration and frequency of the schedule. Refer to the [Key Rotation Schedule Config Screen](#) or [Key Refresh Schedule Config Screen](#), as appropriate for details.

- **SAP GROUPS:** (For key refresh schedules only) Refer to [Add Groups](#) for details.

5. Click **Update** to save the changes.

The Schedules page also contains a section named **JOB HISTORY**. This section displays information related to a schedule such as **Run Date**, **Job ID**, and **Status**.

Viewing Keys Assigned to Schedules

Schedules for a key can be added, updated, and deleted on the KEY SCHEDULE section of the edit view of a key. Refer to [Adding or Changing Key Rotation Schedule](#) for details.

To view the keys assigned to a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

Alternatively, click the **Name** link corresponding to the desired schedule.

The mini detail view of the schedule shows a numbered link next to the **Keys Assigned** label. The number indicates the number of keys assigned to the schedule. If no key is assigned, linked number 0 is displayed.

4. Click the numbered link. The SAP Keys for Schedule: <schedule-name> page is displayed. The page displays the following details:

Field	Description
Key Name	Unique, user-friendly name of the SAP key.
Algorithm	Algorithm of the SAP key. AES, RSA, and EC algorithms with different keys sizes and elliptic curves are supported.
Status	State of the SAP key. The status can be: • Available • Not Available • Deleted
Created By	User who created the key.
Operations	Operations allowed using the SAP key.
Group	SAP group where the SAP key resides.
Version	Version of the key.
Origin	Source of the key material used for the version. The origin can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud.

Field	Description
	• External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud. Refer to Key Creation Methods and Sources for details.
Application	SAP application (for example, SAP S/4HANA Cloud) where the key is used.
Creation Date	Date and time when the SAP key is created.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Managing SAP Reports

CCKM provides options to generate key visibility reports based on key-related activities between CCKM and SAP groups and rotation schedules. SAP reports are categorized as:

- **Key Activity Report:** Inspect individual SAP key histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and SAP group.
- **Key Rotation Report:** Track keys that are scheduled for rotation.

Creating SAP Reports

To create a SAP report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > SAP**. The SAP Reports page is displayed.
3. Click **Add Report**. The Choose Report Type and Name screen of the Add SAP Report wizard is displayed.
4. Select the report type. The options are **Key Activity Report** and **Key Rotation Report**.
5. Specify a **Report Name**. This is a mandatory field.
6. Click **Next**. The Select SAP Group screen of the wizard is displayed.
7. Select a group from the **SAP Groups** drop-down list. The drop-down list contains the list of SAP groups added to the CipherTrust Manager.

8. Click **Add**. The selected group appears under the Selected SAP Groups section.

Similarly, you can add as many groups as you want.

9. Click **Next**. The Set Start and End Dates screen of the wizard is displayed.
10. In the **Include Entries From** field, specify the start date and time for the report.
 - Click the field and select the date and time on the on-screen calendar.
 - Alternatively, enter the time in **MM/DD/YYYYHH:MM** format.
11. In the **To** field, specify the end date and time for the report.
12. Click **Save**.

A success message **Created report** is displayed. The newly created report is displayed under the SAP reports list. The report Run Date becomes *Running Now* and Status becomes *In Progress*. After the run is complete, the date and time of the run is displayed and the Status becomes Completed.

Viewing SAP Reports

The SAP Reports page displays the list of existing reports. Filter the reports by their names.

To view existing SAP reports:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > SAP**. The list of available reports is displayed. The following details of the reports are displayed:

Column Name	Description
Report Name	Name of the report.
Run Date	When the report is run. If a report is running currently, Running Now is displayed.
Type	Type of the report. The type can be: • Key Activity • Key Rotation
Start Date	Start date from when the report is generated.
End Date	End date for the report.
Status	Status of the report. The status can be: • Completed • In Progress

Viewing Details of a SAP Report

To view the details of a SAP report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > SAP**. The list of available reports is displayed.
3. Click the desired **Report Name** link.

Alternatively, click the overflow icon () corresponding to the desired report and click **View**.

The following details of the reports are displayed:

Column Name	Description
Key Name	Name of the key.
SAP User	Name of the SAP user who created the report.
Key Activity	Activity performed on the key.
Event Date	Time and date when the activity took place.
Created At	Date and time when the report is created.
Updated At	Date and time when the report is updated.

Downloading SAP Reports

To download a SAP report as a CSV file:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > SAP**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired report and click **Download**.

Alternatively, click the desired report under **Report Name**, and click **Download CSV** in the detail view.

The report is downloaded as a CSV file.

Deleting SAP Reports

To delete a SAP report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > SAP**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired report and click **Delete**. The Delete Report

message is displayed.

4. Click **Delete**.

The report is removed from the list of reports.

Viewing Linked SAP Applications

When a SAP group is added to the CipherTrust Manager, linked SAP applications are automatically added. One application can have multiple SAP groups associated with it.

When the last group linked with a SAP application is deleted from the CipherTrust Manager, the application is also deleted.

The Applications tab of the SAP Data Custodian Groups page shows the list of applications linked with the groups added to the CipherTrust Manager. Search for the applications by Tenant.

To view the list of applications:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > SAP Groups**. The Groups tab of the SAP Data Custodian Groups page shows the list of groups added to the CipherTrust Manager.
3. Click the **Applications** tab. The tab displays the following details:

Column	Description
Application	Name of the SAP application.
Tenant	Name of the SAP tenant. For SAP Technical Users (TUs), the field remains blank.
Date Added	Date and time when the application is added to the CipherTrust Manager.

Performance Summary

This section provides metrics and results of SAP performance testing.

Test Setup

Test Runner	
Operating System	Ubuntu 20.4
RAM	32GB
Core	16

Appliance	
Build	2.9.0.7341
RAM	16GB

Process

Scripts are written on top of the Locust Framework for load and stress testing. The testing is done for create, read, update, and delete (CRUD) key operations with respect to different numbers of virtual users (VUS) over parallel connections, one for every virtual user.

The testing also done to determine the response for uploading keys by a number (N) of virtual users in time (T).

CRUD Operations

Expand the headings below to view performance numbers.

Time taken per key upload with respect to virtual users

Virutal Users	Minimum	Average	Maximum
10	6.712	9.998	16.605
30	9.7	22.8	33.673
50	11.6	32.64	49.936

In the graph above:

- X-axis represents the increment of virtual users.
- Y-axis represents the time taken by a virtual user to perform BYOK operations.
- 3 line graphs display information for minimum (min), average (avg), and maximum (max) time taken by one of the virtual users running at that time.

Response with request coverage in percentile (10 VUS, 180 seconds)

X% percentile	create_byok	get	update	delete	new-version
50	9.8	2.3	0.62	4.2	9.9
60	10	3.3	0.64	5	11
70	11	4.4	0.66	6.6	12
80	12	5.1	0.71	7.7	13
90	13	6.2	0.84	8.7	14

X% percentile	create_byok	get	update	delete	new-version
100	17	7.6	0.9	9.2	15

Here, X% percentile indicates that X percent requests are completed before this time.

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform any CRUD operation.
- An individual virtual user has performed these CRUD operations sequentially, whereas all the virtual users are spawned in parallel.

Response with request coverage in percentile (30 VUS, 180 seconds)

X% percentile	create_byok	get	update	delete	new-version
50	24	17	0.59	20	25
60	25	19	0.62	21	26

X% percentile	create_byok	get	update	delete	new-version
70	27	19	0.64	21	26
80	29	20	0.67	21	28
90	31	21	0.71	22	30
100	34	23	1.1	22	32

Here, X% percentile indicates that X percent requests are completed before this time.

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform any CRUD operation.
- An individual virtual user has performed these CRUD operations sequentially, whereas all the virtual users are spawned in parallel.
- t represents time taken for a key operation when N virtual users are running in parallel.

Response with request coverage in percentile (50 VUS, 180 seconds)

X% percentile	create_byok	get	update	delete	new-version
50	34	31	0.59	32	41
60	36	31	0.6	33	42
70	37	32	0.63	33	43
80	40	33	0.66	35	44
90	43	35	0.76	38	46
100	50	36	0.95	39	46

Here, X% percentile indicates that X percent requests are completed before this time.

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform any CRUD operation.
- An individual virtual user has performed these CRUD operations sequentially, whereas all the virtual users are

spawned in parallel.

- t represents time taken for a key operation when N virtual users are running in parallel.
-

Key Upload

This section provides performance numbers for uploading keys by a number (N) of virtual users in time (T).

Expand the headings below to view performance numbers.

Number of keys uploaded by virtual users in 100 seconds

Virtual Users	Number of Keys
10	74
30	90
50	95

The graph above shows the number of keys uploaded in t time when N virtual users are spawned in parallel. Also, it indicates throttling condition breakpoints and helps you calculate throughput per second (TPS).

Response for upload with percentile request coverage

X% percentile	10 VUS	30 VUS	50 VUS
50	9.7	24	39
60	11	26	40
70	11	27	41
80	12	28	42
90	14	30	44
100	17	31	49

In the graph above:

- X-axis represents X% (percentile) of request time. It means, X% requests have taken time less than or equal to Y-axis value at X%.
- Y-axis represents the time taken by a virtual user to perform the BYOK (upload key) operation.
- While calculating TPS, Locust informs about the time taken to complete X% requests when all the virtual users are spawned in parallel.
- The number of virtual users does not significantly affect the number of keys being uploaded. This proves the rate limit implemented by SAP side causes throttling.

Downloading SAP Metadata

Downloading SAP Keys Metadata

CCKM users with permissions to view the SAP keys can export and download the keys metadata displayed on the CCKM GUI. Filter the keys metadata to display on the GUI based on your requirements, for example, all keys created in the past 12 months, all keys residing in a specific SAP group, and all keys based on a specific algorithm. You can then download the filtered metadata as a CSV file.

To download the SAP keys metadata visible:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > SAP**. The SAP Keys page is displayed.
3. Filter the keys metadata based on your requirements.

Use the Search box to filter the keys. To further filter the metadata, show/hide the desired columns and use the column-level filters.

4. Click **Download as CSV**.

The filtered SAP keys metadata is downloaded as a CSV file.

SAP HYOK Resources

SAP Data Custodian KMS supports a customer-managed keystore that allows you to create HYOK keys residing in your external key manager. You manage the full lifecycle of HYOK keys within your external key manager. SAP Data Custodian KMS does not have any control over these keys.

Your external key manager handles crypto operations within its secure enclave, using a network endpoint. SAP KMS forwards these requests to your external key manager, where the key material remains protected.

Prerequisites

Before integrating CipherTrust Manager as your external key manager:

1. Ensure that CipherTrust Manager is up and running. Activate and install the CCKM license. Refer to the [CipherTrust Manager Deployment Guide](#) and [Licensing](#) for details.
2. Ensure CipherTrust Manager has a valid publicly accessible hostname and a trusted third-party CA certificate installed on its web interface.
3. Add the SAP Cloud Root CA as both an external CA and an external trusted CA on CipherTrust Manager:
 - a. Download the SAP Cloud Root CA.crt file from the Download section of the [SAP Trust Center Services](#) page.
 - b. Rename the extension of the file from CRT to PEM.
 - c. Add the SAP Cloud Root CA.pem file as an external CA on CipherTrust Manager. Refer to [Add an external CA](#).
 - d. Add the SAP Cloud Root CA.pem file as an external trusted CA on CipherTrust Manager. Refer to [Add an external trusted CA](#).

After ensuring the prerequisites, perform the steps described in the subsequent sections.

Create and download the SAP certificate

1. Log in to your SAP Data Custodian system.
 2. Open the **Key Management** menu.
 3. Select **Keystore Configuration**.
 4. Select **Thales CipherTrust Manager** from the Customer Managed Keystore tab.
-

-
5. Click **Certificate Auth..**
 6. Click **Create**. A new certificate will be generated.
 7. Select the new certificate.
 8. Select **Actions**.
 9. Select **Download**.
 10. Copy the **SAP Certificate ID**.

Create a keystore

Create a keystore on the CipherTrust Manager. Refer to [Creating SAP HYOK Keystores](#) for details. After the keystore is created successfully, copy the keystore URL.

Create a group for HYOK in SAP

You need to create a group for HYOK in SAP for CipherTrust Manager. To create a group.

1. Log in to SAP Data Custodian tenant.
2. Open the **Dashboard**.
3. Select the **Key Management Service** tab.
4. Select an application context.
5. Click **Create Group**.
6. Complete the Group Details section.
7. Open the **Dashboard** again.
8. Complete the Keystore Selection section.
 - a. Select **Customer Managed Keystore (HYOK)**.
 - b. Select **Thales CipherTrust Manager** from the **Keystore** drop-down menu.
 - c. Review Authentication Method section, auto populates to **Certificate**.
9. Select the **Key Management Service** tab again.
10. Complete the Configure Authentication Method section.
 - a. Enter Thales CipherTrust Manager keystore URL in the **Keystore URL** field. You copied it above while creating a SAP keystore.

-
- b. Enter the SAP Certificate ID in the **Certificate ID** field. You copied it above while creating and downloading the certificate.

11. Click **Review**.
12. Review the group details.
13. Click **Create**.

Create an endpoint (key)

Create an endpoint on the CipherTrust Manager. Refer to [Creating SAP HYOK Endpoints](#) for details. After the endpoint is created successfully, copy the globally unique identifier of the endpoint.

Register the key for HYOK in SAP

You need to register the key for HYOK in SAP for CipherTrust Manager. To register the key.

1. Log in to SAP Data Custodian tenant.
2. Open the **Dashboard**.
3. Select the **Key Management Service** tab.
4. Select an application context.
5. Select the HYOK group where the endpoint will be registered.
6. Click the **Keys** tab.
7. Click **Register New Key**.
8. Complete the Key Details section.
 - a. Select the **Key ID**.
 - b. Enter the unique identifier of the endpoint that you created above.
9. Click **Review**.
10. Review key details.
11. Click **Register**.

What's next?

You can manage keystores and endpoints on the CipherTrust Manager.

- [Managing SAP HYOK Keystores](#)

- [Managing SAP HYOK Endpoints](#)
- [Scheduling Operations](#)

Licensing

Thales provides encryption of SAP HYOK keystores through CCKM licensing models. SAP HYOK consumes one CCKM license (cloud unit) per keystore.

The number of SAP HYOK keystores that can be added to the CipherTrust Manager is limited by the number of licenses purchased. For example, if a 1-year license is purchased for 10 cloud units, then only 10 SAP HYOK keystores can be added to the CipherTrust Manager.

An archived or deleted SAP HYOK keystore releases one cloud unit of the CCKM license. It means, you can add another AWS account, Azure subscription, Google Workspace, or SAP HYOK keystore to the CipherTrust Manager. A recovered, enabled, or disabled SAP HYOK keystore consumes one cloud unit of the CCKM license.

Refer to [CCKM Licensing](#) for details.

SAP HYOK endpoints

This section describes how to manage the SAP HYOK endpoints.

Caution

Modify endpoints only through the CipherTrust Cloud Key Management (CCKM) GUI, API, or CLI. Do not modify the KEK using the **Keys** menu, the `ksctl keys` command, or the `/v1/vault/keys2` endpoint. Such modifications might make the KEK unavailable to the SAP HYOK service.

Creating SAP HYOK endpoints

The creation of an endpoint requires SAP HYOK keystores. So, before creating an SAP HYOK endpoint, ensure that you've already [created an SAP HYOK keystore](#).

To create an SAP HYOK endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed.
3. Click **Create Endpoint**. The General Info tab of the Create Endpoint screen is displayed.

General Info

1. Enter **Name**.
2. (Optional) Enter **Description**.
3. Click **Next**. The Key Material tab is displayed.

Key Material

1. Select a **Method**, the options are **Create New Key** and **Select Existing Key**.

Click the desired tab to view the instructions.

Create New Key

- a. Click **Create New Key**.
- b. Enter the **Source Key Name**.
- c. Select **Key Type**, the options are **AES** or **RSA**.
- d. Select the **Key Size** based on the key type:
 - For the **AES** key type, the option is 256.
 - For the **RSA** key type, the options are 3072 and 4096.
- e. Select the **Key Usage** based on the key type. You need to select at least one key usage.
 - For the **AES** key type, the options are Encrypt and Decrypt.
 - For the **RSA** key type, the options are Encrypt, Decrypt, Sign, and Verify.

Copy Existing Key

- a. Click **Copy Existing Key**.
 - b. Select **Key Type**, the options are **AES** or **RSA**.
 - c. Select a **Domain**.
 - d. Select the **Key Size** based on the key type:
 - For the **AES** key type, the option is 256.
 - For the **RSA** key type, the options are 3072 and 4096.
 - e. Select a **Source Key** from the list.
2. Click **Next**. The Select Keystore tab is displayed.

Select Keystore

1. Select a **Keystore** from the list.
2. Click **Next**. The Add Schedule tab is displayed.

Add Schedule

1. (Optional) Select a **Key Rotation Schedule** from the list.
2. Click **Next**. The Review and Add tab is displayed.

Review and Add

This screen shows the endpoint details that you have provided. These details are divided into GENERAL INFO, KEY MATERIAL, SELECT KEYSTORE, and ADD SCHEDULE sections.

Before creating the endpoint, review all details. After the endpoint is added, certain features will no longer be editable.

1. Review the endpoint details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the GENERAL INFO, KEY MATERIAL, SELECT KEYSTORE, and ADD SCHEDULE sections, and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Endpoint**. A success message is displayed on the screen.
3. Click **Close**. The newly created endpoint is displayed in the list of SAP HYOK endpoints.

Note

If you are planning to use this endpoint to register a master/primary key on SAP Data Custodian, please select the key usage as per SAP app requirements. Most SAP applications require master/primary key to have only encrypt and decrypt key usage.

Viewing SAP HYOK endpoints

To view the list of the available SAP HYOK endpoints:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The tab displays the following details:

Column	Description
Key Name	Name of the SAP key.
Key ID	ID of the SAP key.
Keystore Name	Name of the SAP keystore.
Blocked	Indicates whether the endpoint is blocked or unblocked.
Algorithm	Algorithm of the SAP key. The algorithm can be AES

Column	Description
	and RSA.
Size	Size of the SAP Key.
Version	Version of the SAP key.
State	State of the key. The state can be Enabled or Disabled.
SAP Tenant ID	ID of the SAP tenant.
Description	Description of the endpoint.
Creation At	Time when the endpoint is created.
Updated At	Time when the endpoint is updated.

To view the custom columns, click the Customize View () icon, select the desired option, and click **OK**.

Viewing and editing details of an SAP HYOK endpoint

To view or edit the details of an SAP HYOK endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the **Name** link of the desired SAP HYOK endpoint.

Alternatively, click the overflow icon () corresponding to the desired SAP HYOK endpoint, and click **View/Edit**. The SAP HYOK Endpoints page is displayed.

The SAP HYOK Endpoints page shows additional details of the selected endpoint under the VERSIONS, GENERAL INFORMATION, and KEY SCHEDULE sections. Expand each section to view and edit their details.

VERSIONS

- a. Expand the VERSIONS section. The list of versions is displayed.
- b. (Optional) You can add a version to the key, refer to [Rotating an SAP HYOK Endpoint](#).

GENERAL INFORMATION

- a. Expand the GENERAL INFORMATION section.
- b. (Optional) Update the name of the SAP HYOK endpoint in the **Name** field.
- c. (Optional) Update the description of the SAP HYOK endpoint in the **Description** field.

-
- d. Click **Update**.

KEY SCHEDULE

- a. Select a **Rotation** from the drop-down list.
- b. Click **Update**.

Rotating an SAP HYOK endpoint

After rotating the endpoint, the globally unique external key ID will remain the same and a new version of the endpoint will be created which points to a new source endpoint.

To rotate an SAP HYOK Endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Rotate**. The Select Material Origin tab of the Add Version screen is displayed.
5. Select a **Key Type** to rotate the SAP HYOK endpoint. The options are **Create/Upload New Key Material** and **Clone Existing Key Material**.
6. Click the desired tab to view the instructions.

Create/Upload New Key Material

- a. Select the **Create/Upload New Key Material** option.
- b. Click **Next**. The Create Source Key and Add Version tab is displayed.
- c. Enter **Source Key Name**.
- d. Select the **Key Usage** based on the key type. You need to select at least one key usage.
 - For the **AES** key type, the options are Encrypt and Decrypt.
 - For the **RSA** key type, the options are Encrypt, Decrypt, Sign, and Verify.
- e. Click **Add Version**.

Clone Existing Key Material

- a. Select the **Clone Existing Key Material** option.
- b. Click **Next**. The Select Source Key and Add Version tab is displayed

-
- c. Select a **Source Key** from the list.
 - d. Click **Add Version**.

The version is added successfully.

Disabling an SAP HYOK endpoint

You can disable an endpoint to prevent it from being used for cryptographic operations. To disable an SAP HYOK endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Disable**. The Disable Endpoint dialog box is displayed.
5. Click **Disable** to confirm the action.

The endpoint is disabled successfully. The state of the endpoint changes to disabled.

Enabling an SAP HYOK endpoint

You can enable an endpoint to allow it to be used for cryptographic operations. To enable an SAP HYOK endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Enable**. The Enable Endpoint dialog box is displayed.
5. Click **Enable** to confirm the action.

The endpoint is enabled successfully. The state of the endpoint changes to enabled.

Blocking an SAP HYOK endpoint

You can block the access to a specific endpoint. To block an SAP HYOK endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.

-
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
 4. Click **Block**. The Block Endpoint dialog box is displayed.
 5. Click **Block** to confirm the action.

The endpoint is blocked successfully.

Unblocking an SAP HYOK endpoint

You can unblock the access to a specific endpoint. To block an SAP HYOK endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Unblock**. The Unblock Endpoint dialog box is displayed.
5. Click **Unblock** to confirm the action.

The endpoint is unblocked successfully.

Archiving an SAP HYOK endpoint

Archiving is an intermediate state for deleting an endpoint, you need to archive an endpoint to make it deletable. To archive an SAP HYOK Endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Archive**. The Archive Endpoint dialog box is displayed.
5. Select **I wish to archive this endpoint**.
6. Click **Archive**.

You will see a message that the endpoint is archived successfully. The state of the endpoint changes to archived.

Recovering an SAP HYOK endpoint

You can recover an archived endpoint. To recover an SAP HYOK Endpoint:

1. Open the **Cloud Key Manager** application.

2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Recover**. The Recover Endpoint dialog box is displayed.
5. Click **Recover**.

You will see a message that the endpoint is recovered successfully.

Deleting an SAP HYOK endpoint

You can delete the archived endpoint from the CCKM. To delete an SAP HYOK Endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The Endpoints tab of the SAP HYOK page is displayed. The list of added SAP HYOK endpoints is displayed.
3. Click the overflow icon () corresponding to the desired SAP HYOK endpoint.
4. Click **Delete**. The Delete Endpoint dialog box is displayed.
5. Select **I wish to delete this endpoint**.
6. Click **Delete**.

You will see a message that the endpoint is deleted successfully.

SAP HYOK keystores

This section describes how to manage the SAP HYOK keystores.

Creating SAP HYOK keystores

Creation of a keystore requires an SAP tenant ID, keystore URL hostname, and SAP certificate. To create an SAP HYOK keystore:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab.
4. Click **Create Keystore**. The General Info tab of the Create SAP HYOK Keystore screen is displayed.

General Info

1. Enter **Name**.

2. (Optional) Enter **Description**.
3. Click **Next**. The Configure Keystore tab is displayed.

Configure Keystore

1. Enter **SAP Tenant ID**.
2. Enter **Keystore URL Hostname**.

Note

Enable or disable audit recording of successful operations within an external keystore. The default value is false.

3. (Optional) Enable **SAP Enable success audit events**.
4. Add a **SAP Certificate**. You can use the following options to add the SAP Certificate.

File Upload: Select and upload the certificate (in PEM format).

Text: Select and paste the certificate content.

Note

You can [create and download the SAP certificate](#) from the SAP Data Custodian portal.

5. Click **Next**. The Review and Create tab is displayed.

Review and Create

This screen shows the key details that you have provided. These details are divided into GENERAL INFO and CONFIGURE KEYSTORE sections.

Before creating the keystore, review all details. After the keystore is added, certain features will no longer be editable.

1. Review the keystore details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the GENERAL INFO and CONFIGURE KEYSTORE sections, and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Create**. A success message is displayed on the screen.

3. Click **Close**. The newly created keystore is displayed in the list of SAP HYOK keystores.

Viewing SAP HYOK keystores

To view the list of the available SAP HYOK Keystores:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed. The tab displays the following details:

Column	Description
Name	Name of the SAP HYOK keystore.
Keystore URL Hostname	Hostname for the SAP HYOK keystore URL.
Keystore URL	URL of the keystore.
Status	Status of the keystore. The status can be: • Active • Inactive
Block	Indicates whether the keystore is blocked or unblocked.
Tenant	ID of the SAP tenant.
Creation Date	Time when the keystore is created.
Last Updated	Time when the keystore is updated.
Description	Description of the keystore.

To view the custom columns, click the Customize View () icon, select the desired option, and click **OK**.

Viewing and editing details of an SAP HYOK keystore

To view or edit the details of an SAP HYOK keystore:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the **Name** link of the desired SAP HYOK keystore.

Alternatively, click the overflow icon () corresponding to the desired SAP HYOK keystore, and click **View/**

Edit. The SAP HYOK Keystore page is displayed.

The SAP HYOK Keystore page shows additional details of the selected keystore under the **ENDPOINT KEYS**, **GENERAL INFORMATION**, **KEYSTORE CONFIGURATION**, and **ACCESS CONTROL** sections. Expand each section to view and edit their details.

ENDPOINT KEYS

- a. Expand the **ENDPOINT KEYS** section.
- b. The list of endpoint associated with the keystore is displayed. To manage these endpoints, refer to [SAP HYOK Endpoints](#).

GENERAL INFORMATION

- a. Expand the **GENERAL INFORMATION** section.
- b. (Optional) Update the name of the SAP HYOK keystore in the **Name** field.
- c. (Optional) Update the description of the SAP HYOK keystore in the **Description** field.
- d. Click **Update**.

KEYSTORE CONFIGURATION

- a. Expand the **KEYSTORE CONFIGURATION** section.
- b. (Optional) Enter a new **Keystore URL Hostname** to use a different URL hostname.
- c. (Optional) Enable or disable **SAP Enable success audit events**.

Note

Enable or disable audit recording of successful operations within an external keystore. The default value is false.

- d. (Optional) Update the **SAP Certificate**. You can use the following options to update the SAP Certificate.

File Upload: Select and upload the certificate (in PEM format).

Text: Select and paste the certificate content.

Note

Create and download this certificate from SAP Data Custodian Portal Key Management Service > Configuration > Thales CipherTrust Manager.

e. Click **Update**.

ACCESS CONTROL

Refer to [Managing User Permissions on SAP HYOK Keystore](#) for details.

Managing User permissions on SAP HYOK keystore

To work with the external resources, users/groups must have the minimum set of permissions that allow them to use the SAP HYOK keystores.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on SAP HYOK keystores.

Users with the following characteristics can perform operations on SAP HYOK keystores:

- Users in the **CCKM Admins** group
- Users in the **Admin** group
- Users who are administrators for a **domain**
- Users who are in the **CCKM Users** group and which have had a CCKM Admin assign permissions through the UI or the `/v1/cckm/sap/ekm/keystores/{id}/update-acls` endpoint in the REST API.

Adding permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the **Name** link of the desired SAP HYOK keystore.

Alternatively, click the overflow icon () corresponding to the desired SAP HYOK keystore, and click **View/Edit**. The SAP HYOK Keystore page is displayed.

5. Expand the **ACCESS CONTROL** section.
6. Click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
7. Select the desired user or group from the **User/Group** drop-down list.
8. Click **Save**.

The newly added user/group is displayed under **Name** in the **ACCESS CONTROL** section.

CCKM allows the following operations on the SAP HYOK keystores:

- View Keys, Add Key, Delete Key.
- Refresh Domain.

You can now grant additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Granting permission to perform an operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the **ACCESS CONTROL** section, select the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a permission

To remove a permission assigned to a user or group:

1. In the **ACCESS CONTROL** section, clear the check box under the desired operation corresponding to the desired users or groups.
2. Click **Update**.

A success message is displayed on the screen.

Removing permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the **ACCESS CONTROL** section, under **Unassign**, click the **X** button corresponding to the desired user/group.

2. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

3. Click **Remove** to confirm the action. To cancel the action, click **Keep It**.

A success message is displayed on the screen.

Blocking an SAP HYOK keystore

You can block a keystore to deny all proxy API requests from both the keystore and its endpoints. To block an SAP HYOK keystore:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the overflow icon () corresponding to the desired SAP HYOK keystore.
5. Click **Block**. The Block Keystore dialog box is displayed.
6. Click **Block** to confirm the action.

The keystore is blocked successfully. The state of the keystore changes to Blocked.

Unblocking an SAP HYOK keystore

You can block a keystore to accept all proxy API requests from both the keystore and its endpoints. To block an SAP HYOK keystore:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the overflow icon () corresponding to the desired SAP HYOK keystore.
5. Click **Unblock**. The Unblock Keystore dialog box is displayed.
6. Click **Unblock** to confirm the action.

The keystore is unblocked successfully. The state of the keystore changes to Unblocked.

Deleting an SAP HYOK keystore

You can delete an archived keystore that has no endpoints from the CCKM. To delete an SAP HYOK keystore:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the overflow icon () corresponding to the desired SAP HYOK keystore.
5. Click **Delete**. The Delete Keystore dialog box is displayed.

Note

The keystore can only be deleted if it does not contain any SAP HYOK Endpoints.

6. Select **I wish to delete key material**.
7. Click **Delete**.

You will see a message that the keystore is deleted successfully.

Archiving an SAP HYOK keystore

Archiving transitions a keystore to an intermediate state, a prerequisite for its deletion. When a keystore is archived, its associated endpoints are also archived, and a CCKM license is released.

To archive an SAP HYOK Endpoint:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the overflow icon () corresponding to the desired SAP HYOK keystore.
5. Click **Archive**. The Archive Keystore dialog box is displayed.
6. Select **I wish to archive this keystore**.
7. Click **Archive**.

You will see a message that the keystore is archived successfully. The state of the keystore changes to archived.

Recovering an SAP HYOK keystore

You can recover an archived keystore. To recover an SAP HYOK Keystore:

Note

Recovering an archived SAP keystore consumes a CCKM license unit. This process does not automatically recover its previously associated endpoints; you must recover them individually. Refer to [Recovering an SAP HYOK endpoint](#) for details.

To recover an SAP HYOK Keystore:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Services > SAP HYOK**. The SAP HYOK page is displayed.
3. Click the **SAP Keystores** tab. The list of added SAP HYOK keystores is displayed.
4. Click the overflow icon () corresponding to the desired SAP HYOK keystore.
5. Click **Recover**. The Recover Keystore dialog box is displayed.
6. Click **Recover**.

You will see a message that the keystore is recovered successfully.

Scheduling Operations

CCKM allows you to periodically rotate keys in the background. To rotate keys, you need to create schedule configuration. A schedule configuration defines when to run a rotate job. You can use either basic format or cron format to specify the time when the rotate job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- Repeats: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- at: specific time at which the refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

"* * * * *"

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. **Select Schedule Type as Key Rotation.**
5. Click **Next**.
6. On the **General Info** screen, enter or select the following details:
 - Enter a unique **Scheduler Name**.
 - From the **Cloud Name** drop-down list, select **SAP HYOK**.
 - (Optional) Add a **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. Set the values on the **Schedule Config** screen.
 - a. Configure **DURATION** for the scheduler. Specify the following values:
 - **Schedule Starts**
 - **Schedule Ends**

If you select the **Never** check box, the scheduler configuration will never expire, and the Schedule Ends field becomes unavailable.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either the **Basic** or the **Raw (Cron)** format to specify the value.

8. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays the following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation • Key Refresh • Add KMS Container (GCP and Azure only) For Luna HSM, only Key Refresh is supported.
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Creation time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

3. Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.
4. Edit or configure the following fields and click **Update**:
 - Description.
 - Status of the scheduler configuration.
 - Scheduler configuration parameters such as duration, frequency, and expiry time of the key.

The Schedules page also contains a section named **JOB HISTORY** that contains all the related information about a schedule such as **Run Date**, **Job ID**, **Status**, and **Errors**.

Disabling Schedules

To disable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.

3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Salesforce Resources

CCKM supports the Salesforce and Salesforce Sandbox clouds. The Salesforce Sandbox is a copy of your production Salesforce environment used primarily for testing, development, or training. In this document, the information about Salesforce is applicable to both Salesforce and Salesforce Sandbox unless stated otherwise.

Your login credentials for Salesforce and Salesforce Sandbox are unique to each cloud. If you are configuring the setup for Salesforce Sandbox, ensure to configure within the Salesforce Sandbox cloud.

Manage the Salesforce organizations and tenant secrets stored in your Salesforce account using CCKM.

Note

The instructions provided in this section are specific to the Salesforce Classic interface. If you are using Salesforce Lightning, you will notice a different interface. So, refer to the corresponding sections of the Salesforce Lightning interface documentation to complete the prerequisites.

Note

- Salesforce's Shield Platform Encryption Service must be enabled.
- To generate Salesforce reports, **Event Monitoring** (a paid feature) must be enabled in the Salesforce cloud.
- Salesforce provides two profile interfaces: *Original Profile Interface* and *Enhanced Profile User Interface*. Steps in this section are based on the *Enhanced Profile User Interface*. To enable the Enhanced Profile User Interface, refer to [Enable the Enhanced Profile User Interface](#) in the Salesforce documentation.

Prerequisites

Access to Salesforce resources can be configured using profiles and permission sets. Depending on your requirements, use either method. However, permission sets is the recommended method to configure access. After configuring the access, you can add a Salesforce connection on the CipherTrust Manager.

Before you can manage Salesforce resources on CCKM:

1. [Configure Access to Salesforce](#)

-
2. Configure Advanced Settings on Salesforce
 3. Add Salesforce Connection on CipherTrust Manager

Configure Access to Salesforce

Click a tab to view details.

Using Permission Set

1. Create a New Profile

Create a new profile or use an existing one. Creating a new profile is recommended. This section describes steps to create a new profile.

1. Log on to your Salesforce cloud account.
2. At the top right, click **Setup**.
3. In the left pane, under **Administer**, click **Manage Users > Profiles**. The Profiles page shows the list of existing profiles.
4. Click **New profile**. The Clone Profile page is displayed.
 - a. From the **Existing Profile** drop-down list, select **Minimum Access - Salesforce**.
 - b. Enter **Profile Name**, for example, **no_permission_profile**.
 - c. Click **Save**.

The profile is created.

5. Remove the assigned permissions.

The GUI slightly differs for Salesforce production environment and Salesforce Sandbox.

Click a tab to view details.

Salesforce Sandbox

- a. Scroll down to the **System** section.
- b. Click the **System Permissions** link. The list of permissions assigned to the profile is displayed. These permissions are based on the profile you selected from the **Existing Profile** drop-down list.
- c. Next to **System Permissions**, click **Edit**. The edit view of the profile is displayed.
- d. Clear all the set permissions.

Note

A few permissions are enabled and read-only. They cannot be cleared, just ignore them.

- e. Scroll up the page.
- f. Click **Save**. The Permission Changes Confirmation dialog box is displayed.

Salesforce (Production Environment)

- a. Next to **Profile Detail**, click **Edit**. The edit view of the profile is displayed.
- b. Scroll down to the **Administrative Permissions** section. The list of permissions assigned to the profile is displayed. These permissions are based on the profile you selected from the **Existing Profile** drop-down list.
- c. Clear all the set permissions.

Note

A few permissions are enabled and read-only. They cannot be cleared, just ignore them.

- d. Scroll down to the **General User Permissions** section.
 - e. Clear all the set permissions.
 - f. Scroll up the page.
6. Click **Save** to confirm the changes.

2. Create a New User

Create a new user or edit an existing one to change the profile. This section describes steps to create a new user.

1. In the left pane, under **Administer**, click **Manage Users > Users**. The All Users page is displayed.
2. In the middle of the page, click **New User**. The New User page is displayed.
3. Specify the user details such as first name, last name, alias, email address, username, and nickname.
4. Select the **User License** that has the **Manage Encryption Keys** and **View Event Log Files** system permissions.
5. From the **Profile** drop-down list, select **no_permission_profile** (the profile created in 1. [Create a New](#)

Profile).

6. Click **Save**.

The user is created.

3. Create a New Permission Set

1. In the left pane, under **Administer**, click **Manage Users > Permission Sets**. The Permission Sets page displays the list of existing permission sets.
2. Click **New**. The Create page is displayed.
3. Enter permission set information such as Label, API Name, and Description.
4. Under **Select the type of users who will use this permission set**, make sure that **None** is selected in the **License** drop-down list.
5. Click **Save**.

The permission set is created.

4. Add Permissions to the Permission Set

1. Scroll down to the **System** section.
2. Click the **System Permissions** link.
3. Next to **System Permissions**, click **Edit**. The edit view of the permissions set is displayed.
4. Make sure the following permissions are selected:
 - **API Enabled**: To access any Salesforce.com API.
 - **Manage Encryption Keys**: To manage tenant secrets.
 - **Modify Metadata Through Metadata API Functions**: To synchronize certificates.
 - **View Event Log Files**: To run reports.
 - **View Roles and Role Hierarchy**: To view roles and role hierarchy.
 - **View Setup and Configuration**: To get list of SFDC organizations and their details.
5. Scroll up the page.
6. Click **Save**. The Permission Changes Confirmation dialog box is displayed.
7. Click **Save** to confirm the changes.

5. Assign the User to the Permission Set

1. At the top of the page, click **Manage Assignments**. The Assigned Users page of the permission set is displayed.
2. Click **Add Assignments**. The All Users page displays the list of existing users.
3. Select the user created in 2. [Create a New User](#).
4. Click **Next**.
5. Click **Assign**. The permission set is assigned to the selected user.
6. Click **Done**.

The user assigned to the permission set is displayed in the list of assigned users.

6. Create a Connected App

Create a new Connected App or use an existing one. If you are using an existing App, then remove any profiles currently assigned to the Connected App and assign the permission set created in 3. [Create a New Permission Set](#). This section describes steps to create a new Connected App.

1. In the left pane, under **Build**, click **Create > Apps**. The Apps page shows the list of available apps. On this page, you can create a new Connected App.
2. Navigate to the **Connected Apps** section. Scroll down the page if needed.
3. Click **New**. The New Connected App page is displayed.
4. Specify the **Basic Information**, for example, the app's name, logo, and contact information. The mandatory fields are:
 - **Connected App Name**: A unique name for your Connected App. The name can only contain underscores and alphanumeric characters. The name must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - **API Name**: A name for the connected API. It is populated automatically with the Connected App Name you specified above. Change the API name if you want.
 - **Contact Email**: A valid email address.

You can also specify additional (optional) details such as contact phone number, URLs, and description.

5. Under **API (Enable OAuth Settings)**:
 - a. Select **Enable OAuth Settings**. More fields are displayed.
 - b. (Optional but recommended. Applicable to certificate-based authentication.) Select **Use digital signatures**. This specifies that a digital certificate is used to make API calls to Salesforce. The digital

certificate is the public key of an RSA key pair (a public-private key pair) created on the CipherTrust Manager.

Click **Choose File** to upload the desired digital certificate (public key). This certificate can be downloaded on the CipherTrust Manager when a connection to the Salesforce cloud is added. Refer to [Connection Management](#) for details.

- c. Under **Selected OAuth Scopes**, select the OAuth scopes to apply to the Connected App. OAuth scopes define permissions for the Connected App that are granted as tokens after the app is authorized. The OAuth token name is in parentheses.

To select an OAuth scope:

- a. From the **Available OAuth Scopes** list, select the desired OAuth scope.

CipherTrust Manager requires the following OAuth scopes:

- Access the identity URL service (id, profile, email, address, phone)
- Manage user data via APIs (api)
- Perform requests at any time (refresh_token, offline_access)

Use the **Ctrl** key to select multiple scopes.

- b. Click the **Add** button (between Available OAuth Scopes and Selected OAuth Scopes sections). The selected OAuth scope moves under the Selected OAuth Scopes section.

It is recommended to not select the **Full access (full)** scope.

- d. Make sure that **Require Secret for Web Server Flow** is selected. This ensures the app's client secret is required in exchange for an access token.
- e. Clear **Require Secret for Refresh Token Flow**.

6. Click **Save**. Changes can take up to 10 minutes to take effect.

7. Click **Continue**.

When the Connected App is created, the app details are displayed. Note down the Consumer Key, Consumer Secret, and Salesforce username with its password. This information is required when adding a Salesforce connection to the CipherTrust Manager.

To gather this information any time:

1. Log on to your Salesforce cloud account.
2. In the left pane, under **Build**, click **Create > Apps**. The Apps page shows available apps.
3. Navigate to the **Connected Apps** section. Scroll down the page if needed.

-
4. Click your Connected App to view its details. The Consumer Key and Consumer Secret are displayed under the API (Enable OAuth Settings) section.

On the Add Connection page of the CipherTrust Manager GUI, the Salesforce Consumer Key and Consumer Secret are called Client ID and Client Secret respectively.

Client ID and Client Secret are required for Client Secret as the Authentication type. For Certificate as the Authentication type, only Username and Client ID are required.

7. Add OAuth Policies on Salesforce

Next, you need to specify who all can access the Connected App. This is done by adding appropriate OAuth policy to the Connected App on the Salesforce cloud.

1. In the left pane, under **Administer**, click **Manage Apps > Connected Apps**. The Connected Apps page shows the available apps.
2. Under **Master Label**, click your Connected App. The Connected App Detail page is displayed.
3. Click **Edit Policies**. The edit view of the Connected App is displayed.
4. Under the **OAuth Policies** section, from the **Permitted Users** drop-down list, select **Admin approved users are pre-authorized**.

Changing the OAuth policies can cause access deny issues for users currently using the app.

5. Click **OK** to confirm the action.
6. From the **IP Relaxation** drop-down list, select an appropriate option. Consult your Salesforce administrator for the appropriate option.
7. Select **Refresh token is valid until revoked**.
8. Click **Save**. You are returned to the Connected App Detail page.

8. Assign the Permission Set to the Connected App

1. Scroll down to the **Permission Sets** section.
2. Click **Manage Permission Sets**. The Application Permission Set Assignment page is displayed.
3. Select the permission set created in 3. [Create a New Permission Set](#).
4. Click **Save**.

The selected permission set is assigned to the Connected App.

Using Profile

1. Create a New Profile

1. Log on to your Salesforce cloud account.
2. At the top right, click **Setup**.
3. In the left pane, under **Administer**, click **Manage Users > Profiles**. The Profiles page shows the list of existing profiles.
4. Click **New profile**. The Clone Profile page is displayed.
5. From the **Existing Profile** drop-down list, select **Minimum Access - Salesforce**.
6. Enter **Profile Name**.
7. Click **Save**.

The profile is created.

2. Assign Permissions to the Profile

1. Edit the profile.

The GUI slightly differs for Salesforce production environment and Salesforce Sandbox.

Click a tab to view details.

Salesforce Sandbox

- a. Scroll down to the **System** section.
- b. Click the **System Permissions** link. The list of permissions assigned to the profile is displayed. These permissions are based on the profile you selected from the **Existing Profile** drop-down list.
- c. Next to **System Permissions**, click **Edit**. The edit view of the profile is displayed.
- d. Make sure the following permissions are selected:
 - **API Enabled**: To access any Salesforce.com API.
 - **Manage Encryption Keys**: To manage tenant secrets.
 - **Modify Metadata Through Metadata API Functions**: To synchronize certificates.
 - **View Event Log Files**: To run reports.
 - **View Roles and Role Hierarchy**: To view roles and role hierarchy.

- **View Setup and Configuration:** To get list of SFDC organizations and their details.

e. Scroll up the page.

f. Click **Save**. The Permission Changes Confirmation dialog box is displayed.

Salesforce (Production Environment)

a. Next to **Profile Detail**, click **Edit**. The edit view of the profile is displayed.

b. Scroll down to the **Administrative Permissions** section. The list of permissions assigned to the profile is displayed. These permissions are based on the profile you selected from the **Existing Profile** drop-down list.

c. Make sure the following permissions are selected:

- **API Enabled:** To access any Salesforce.com API.
- **Manage Encryption Keys:** To manage tenant secrets.
- **Modify Metadata Through Metadata API Functions:** To synchronize certificates.
- **View Roles and Role Hierarchy:** To view roles and role hierarchy.
- **View Setup and Configuration:** To get list of SFDC organizations and their details.

d. Under **General User Permissions**, select **View Event Log Files**. This is required to run reports.

e. Scroll up the page.

2. Click **Save** to confirm the changes.

3. Create a New User

Create a new user or edit an existing one to change the profile. This section describes steps to create a new user.

1. In the left pane, under **Administer**, click **Manage Users > Users**. The All Users page is displayed.
2. In the middle of the page, click **New User**. The New User page is displayed.
3. Specify the user details such as first name, last name, alias, email address, username, and nickname.
4. Select the **User License** that has the **Manage Encryption Keys** and **View Event Log Files** system permissions.
5. From the **Profile** drop-down list, select the profile created in [1. Create a New Profile](#).
6. Click **Save**.

The user is created.

4. Create a Connected App

1. In the left pane, under **Build**, click **Create > Apps**. The Apps page shows available apps. On this page, you can create a new connected app.
2. Navigate to the **Connected Apps** section. Scroll down the page if needed.
3. Click **New**. The New Connected App page is displayed.
4. Specify the **Basic Information**, for example, the app's name, logo, and contact information. The mandatory fields are:
 - **Connected App Name:** A unique name for your connected app. The name can only contain underscores and alphanumeric characters. The name must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - **API Name:** A name for the connected API. It is populated automatically with the Connected App Name you specified above. Change the API name if you want.
 - **Contact Email:** A valid email address.

You can also specify additional (optional) details such as contact phone number, URLs, and description.

5. Under **API (Enable OAuth Settings)**:
 - a. Select **Enable OAuth Settings**. More fields are displayed.
 - b. (Optional but recommended. Applicable to certificate-based authentication.) Select **Use digital signatures**. This specifies that a digital certificate is used to make API calls to Salesforce. The digital certificate is the public key of an RSA key pair (a public-private key pair) created on the CipherTrust Manager.

Click **Choose File** to upload the desired digital certificate (public key). This certificate can be downloaded on the CipherTrust Manager when a connection to the Salesforce cloud is added. Refer to [Connection Management](#) for details.

- c. Under **Selected OAuth Scopes**, select the OAuth scopes to apply to the connected app. OAuth scopes define permissions for the connected app that are granted as tokens after the app is authorized. The OAuth token name is in parentheses.

To select an OAuth scope:

- a. From the **Available OAuth Scopes** list, select the desired OAuth scope.

CipherTrust Manager requires the following OAuth scopes:

- Access the identity URL service (id, profile, email, address, phone)
- Manage user data via APIs (api)

-
- Perform requests at any time (refresh_token, offline_access)

Use the **Ctrl** key to select multiple scopes.

- b. Click the **Add** button (between Available OAuth Scopes and Selected OAuth Scopes sections). The selected OAuth scope moves under the Selected OAuth Scopes section.

It is recommended to not select the **Full access (full)** scope.

- d. Make sure that **Require Secret for Web Server Flow** is selected. This ensures that the app's client secret is required in exchange for an access token.

- e. Clear **Require Secret for Refresh Token Flow**.

6. Click **Save**. Changes can take up to 10 minutes to take effect.

7. Click **Continue**.

When the connected app is created, the app details are displayed. Note down the Consumer Key, Consumer Secret, and Salesforce username with its password. This information is required when adding a Salesforce connection to the CipherTrust Manager.

To gather this information any time:

1. Log on to your Salesforce cloud account.
2. In the left pane, under **Build**, click **Create > Apps**. The Apps page shows available apps.
3. Navigate to the **Connected Apps** section. Scroll down the page if needed.
4. Click your connected app to view its details. The Consumer Key and Consumer Secret are displayed under the API (Enable OAuth Settings) section.

On the Add Connection page of the CipherTrust Manager GUI, the Salesforce Consumer Key and Consumer Secret are called Client ID and Client Secret respectively.

Client ID and Client Secret are required for Client Secret as the Authentication type. For Certificate as the Authentication type, only Username and Client ID are required.

5. Add OAuth Policies on Salesforce

Next, you need to specify who all can access the Connected App. This is done by adding appropriate OAuth policy to the Connected App on the Salesforce cloud.

1. In the left pane, under **Administer**, click **Manage Apps > Connected Apps**. The Connected Apps page shows available apps.
 2. Under **Master Label**, click your Connected App.
 3. Click **Edit Policies**. The edit view of the Connected App is displayed.
 4. Under the **OAuth Policies** section, from the **Permitted Users** drop-down list, select **Admin approved users**
-

are pre-authorized.

Changing the OAuth policies can cause access deny issues for users currently using the app.

5. Click **OK** to confirm the action.
6. From the **IP Relaxation** drop-down list, select an appropriate option. Consult your Salesforce administrator for the appropriate option.
7. Select **Refresh token is valid until revoked**.
8. Click **Save**. You are returned to the Connected App Detail page.

6. Assign the Profile to the Connected App

Next, you need to select the appropriate profiles to choose which users have access to this application.

1. Scroll down to the **Profiles** section.
2. Click **Manage Profiles**. The Application Profile Assignment page is displayed.
3. Select the profile created in [1. Create a New Profile](#).
4. Click **Save**.

The selected profile is assigned to the Connected App.

Configure Advanced Settings on Salesforce

Additionally, configure the following settings on Salesforce (**Security Controls > Platform Encryption > Advanced Settings**).

Note

Note that a few settings might not be available depending on your Salesforce account.

- **Allow BYOK to Opt Out of Key Derivation:** Enable or disable the Salesforce key derivation process.
 - Turn ON to disable the Salesforce key derivation process and use your uploaded key material as the final encryption key. If this option is disabled, the BYOK upload will fail.
 - Turn OFF to use key derivation.
- **Allow Cache-Only Keys with BYOK:** Allow or deny the use of cache-only keys with BYOK.
 - Turn ON to use cache-only keys. This lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

-
- Turn OFF for *non* cache-only keys.
 - **Enable Replay Detection for Cache-Only Keys:** Replay detection protects your cache-only keys if a callout is fraudulently intercepted.
 - Turn ON to insert an auto-generated, unique marker called a request identifier into every callout. Any callout with missing or mismatched request identifiers is aborted by Salesforce.
 - Turn OFF to disable replay detection.

Add Salesforce Connection on CipherTrust Manager

Before you can add a Salesforce organization to the CCKM, a connection to your Salesforce account must already exist on the CipherTrust Manager. A CipherTrust Manager administrator manages connections to external resources on the **Access Management > Connections Management** page of the CipherTrust Manager GUI. Refer to [Connection Manager](#) for details.

If you need a connection with certificate-based authentication, specify Username and Client ID, select Certificate as the Authentication type, and generate and download the certificate. The downloaded certificate needs to be uploaded to the connected app on the Salesforce cloud. Refer to [Upload Public Certificate to Salesforce](#) for details.

After completing the prerequisites, you can view linked Salesforce organizations and manage linked tenant secrets on the CipherTrust Manager.

Refer to the following sections:

- [Managing Salesforce Organizations](#)
- [Managing Salesforce Tenant Secrets](#)
- [Scheduling Operations](#)
- [Managing Salesforce Reports](#)
- [Managing Salesforce Cache-Only Key Endpoints](#)
- [Managing Certificates from Salesforce Organizations](#)

Managing Salesforce Organizations

This section describes how to manage Salesforce organizations on CCKM. Before proceeding, a connection to your Salesforce account must exist on the CipherTrust Manager. Refer to [Connection Manager](#) for details.

After the connection is configured, you can add organizations to the CipherTrust Manager. Salesforce organizations can be added, viewed, modified, or deleted on the Salesforce Organizations page.

Each Salesforce organization consumes one [CCKM license cloud unit](#) when added to CCKM.

A Salesforce organization is needed to [upload tenant secrets](#), [upload cache-only keys](#), and [view Salesforce reports](#).

Adding an Existing Salesforce Organization

You can add existing organizations linked to a Salesforce connection to the CipherTrust Manager. An existing organization can only be added just once.

To add an existing Salesforce organization:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**. The Salesforce Organizations page is displayed.
3. Click **Add Existing Organization**. The Add Existing Organization screen is displayed.
4. Select the desired **Connection** from the drop-down list. The list of existing organizations linked with the selected connection is displayed in the Organization field.
5. Select the desired **Organization**.
6. Click **Add**.

The selected organization is displayed on the Salesforce Organizations page. Now, you can manage the organization from CCKM on the CipherTrust Manager.

The organization is available to [upload tenant secrets](#), [associate to cache-only key endpoints](#), and [view Salesforce reports](#).

If the selected organization is already added to the CipherTrust Manager, an error message is displayed.

Viewing Salesforce Organizations

The Salesforce Organizations page shows the list of organizations added to the CipherTrust Manager. Search for the organizations by Name or Connection.

To view the list of organizations added to the CipherTrust Manager:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**. The Salesforce Organizations page shows the list of organizations added to the CipherTrust Manager.

The page displays the following details:

Column	Description
Organization Name	Name of the organization.
Organization ID	ID of the Salesforce organization.
Organization Type	Type of the Salesforce organization.
Connection	Name of the Salesforce connection added to the

Column	Description
	CipherTrust Manager.
Cloud Name	Name of the Salesforce cloud. The cloud can be SFDC or Sandbox.
Last Refreshed	Time when the group was refreshed the last.

To view the custom columns, click the Customize View (⚙️) icon, select the desired option, and click **OK** to display the column.

Refreshing Organizations

Refreshing is the process to download keys created in Salesforce organizations to the CCKM. You can refresh keys from individual or all Salesforce organizations.

- [Refreshing Specific Organizations](#)
- [Refreshing All Organizations](#)

Refreshing Specific Organizations

To refresh an organization:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**. The Salesforce Organizations page is displayed.
3. Click the overflow icon (⋮) corresponding to the desired organization and click **Refresh Now**.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Salesforce > Salesforce Keys** page. Refer to [Viewing Salesforce Keys](#) for details.

Refreshing All Organizations

To refresh all organizations:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**. The Salesforce Organizations page is displayed.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all organizations is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Salesforce > Salesforce Keys** page. Refer to [Viewing Salesforce Keys](#) for details.

Viewing Details of an Organization

To view the details of an organization on CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**.
3. Click the **Organization Name** link of the desired organization.

Alternatively, click the overflow icon () corresponding to the desired organization, and click **View/Edit Details**.

The edit view of the Salesforce Organizations page shows additional details of the selected organization under the ACCESS CONTROL, CERTIFICATES, ENDPOINTS, and CONNECTION sections. Expand each section to view more details.

Changing the Salesforce Connection

To change the Salesforce connection:

1. Expand **CONNECTION**.
2. From the **Connection ID** drop-down list, select the Salesforce connection.
3. Click **Update**.

The connection of the Salesforce organization is changed.

Managing User Permissions on Salesforce Organizations

To work with the Salesforce cloud, users/group must have the minimum set of permissions that allow them to use the Salesforce resources such as keys, organizations, and certificates. Initially, the CCKM user only has permission to view the keys. However, if required, the CCKM administrator can grant and revoke permissions.

Note

Only the users who are member of the CCKM Users group will be granted permissions to perform operations on Salesforce organizations.

Users with the following characteristics can perform operations for Salesforce keys, Salesforce organizations, and Salesforce certificates:

- Users in the **CCKM Admins** group
- Users in the **Admin** group
- Users who are administrators for a **domain**
- Users who are in the **CCKM Users** group and which have had a CCKM Admin assign permissions through the UI or the `/v1/cckm/sfdc/organizations/{id}/update-acls` endpoint in the REST API.

Note

A CCKM administrator can **only** assign permissions to do Salesforce certificate operations or Salesforce cache-only key operations through the REST API.

Adding Permissions for a User/Group

To add permissions for a user/group:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**.
3. Click the **Organization Name** link of the desired organization.

Alternatively, click the overflow icon () corresponding to the desired organization, and click **View/Edit Details**.

4. Expand the **ACCESS CONTROL** section. This section contains the **BYOK Keys**, **Native Keys**, **Cache-Only Keys**, and **Certificates** tabs.
5. Click **Assign User/Group**. The **Assign User/Group** dialog box is displayed.
6. Select the desired user or group from the **User/Group** drop-down list.
7. Click **Save**.

The newly added user/group is displayed under **Name** in the **ACCESS CONTROL** section. You can now grant

additional permissions to the user/group, as appropriate. Refer to [Granting Permission to Perform an Operation](#) for details.

Granting Permission to Perform an Operation

To grant permissions to the user or group to perform any of the above mentioned operations:

1. In the ACCESS CONTROL section, click the desired tab.
2. Select the check box under the desired operation corresponding to the desired users or groups.
3. Click **Update**.

A success message is displayed on the screen.

To revoke permissions from a user/group, refer to [Removing a Permission](#) for details.

Removing a Permission

To remove a permission assigned to a user or group:

1. In the ACCESS CONTROL section, click the desired tab.
2. Clear the check box under the desired operation corresponding to the desired users or groups.
3. Click **Update**.

A success message is displayed on the screen.

Removing Permission from a User/Group

To remove current permissions assigned to the user/group:

1. In the ACCESS CONTROL section, click the desired tab.
2. Under **Unassign**, click the **X** button corresponding to the desired user/group.
3. On the **Remove User / Remove Group** screen, click **Remove**.

Note

Removing this user/group will remove all permissions currently assigned to the user/group.

4. Click **Remove** to confirm the action. To cancel the action, click **Keep It**.

A success message is displayed on the screen.

Removing a Salesforce Organization

Salesforce organizations can be removed on the Salesforce Organizations page. Search for existing organizations using Name or Connection.

Note

When a Salesforce organization is removed from CCKM, it is also deleted from the Salesforce cloud.

To remove an organization from CCKM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**. The Salesforce Organizations page is displayed. The list of organizations added to CCKM is displayed.
3. Click the overflow icon () corresponding to the organization you want to remove.
4. Click **Delete**. The Delete Organization dialog box is displayed.
5. Click **Delete**.

The Salesforce organization is deleted successfully. The organization is removed from the list of Salesforce organizations.

Managing Salesforce Tenant Secrets

This section describes how to manage Salesforce tenant secrets on CCKM. The Salesforce tenant secrets are referred to as *keys* on the CCKM GUI.

When a new tenant secret is created, its status becomes **ACTIVE**, and the status of the previous tenant secret becomes **ARCHIVED**.

When an **ARCHIVED** tenant secret is destroyed, its status becomes **DESTROYED**. A destroyed tenant secret can either be imported or deleted. When a destroyed tenant secret is imported, its status changes to **ARCHIVED**.

Before proceeding, you must have a Salesforce organization added to the CCKM. Refer to [Salesforce Organizations](#) for details.

Salesforce Tenant Secret Types

CCKM lets you manage three types of tenant secrets, Salesforce Native, Bring Your Own Key (BYOK) or cache-only key.

- Salesforce Native tenant secrets are generated directly on Salesforce.
- BYOK tenant secrets are keys which CCKM creates from CipherTrust Manager or DSM, and uploads to Salesforce through a secure channel. Traffic for BYOK operations only takes place from CCKM to Salesforce

and not the reverse direction. BYOK keys can act either as key encryption keys or data encryption keys on Salesforce, depending on whether you select the key derivation option.

- Cache-only key tenant secrets are keys which CCKM creates from CipherTrust Manager or DSM, and uploads to Salesforce, which stores the key material in the encrypted key cache to encrypt or decrypt data on demand. After Salesforce flushes its cache and a new cryptographic request is made, Salesforce fetches key material from a cache-only key endpoint on CCKM. These key transmissions occur in a secure tunnel.

You can perform the following operations with Salesforce tenant secrets:

- [Key Creation Methods and Sources](#)
- [Creating/Uploading New Key Material](#)
- [Cloning Existing Key Material](#)
- [Viewing Salesforce Keys](#)
- [Refreshing Salesforce Keys](#)
- [Viewing Versions of a Key](#)
- [Destroying a Key Version](#)
- [Importing a Destroyed Key Version](#)
- [Deleting a Key Backup](#)
- [Activating a Cache-Only Key](#)

Key Creation Methods and Sources

Methods to create Salesforce keys using CCKM are:

- **Creating/Uploading New Key Material:** Add key material by creating and uploading new source key or creating new native key. The key source can be:
 - **CipherTrust (Local):** A new key is first created on the CipherTrust Manager. Then, this key material is uploaded to Salesforce to create a new Salesforce key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **Salesforce (Native):** A new key is directly created on Salesforce using the native Salesforce application. The key origin is **NATIVE**.
 - **CipherTrust (External):** A new key is first created on the external CipherTrust Manager. Then, this key material is uploaded to Salesforce to create a new Salesforce key. As the key material is uploaded from the external CipherTrust Manager, the key origin is **CipherTrust (External)**.
 - **Vormetric DSM:** A new DSM key is first created on the CipherTrust Manager. Then, this key material is uploaded to Salesforce to create a new Salesforce key. As the key material is uploaded from the
-

CipherTrust Manager, the key origin is **CCKM**.

- **Cloning Existing Key Material:** Clone key material from an existing key to create a new key. The key sources can be:
 - **CipherTrust (Local):** An existing local CipherTrust Manager key is uploaded to Salesforce to create a new Salesforce key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **Vormetric DSM:** An existing DSM key is first cloned on the CipherTrust Manager. Then, the key material is uploaded to the Salesforce cloud to create a new Salesforce key. As the key material is uploaded from the CipherTrust Manager, the key origin is **CCKM**.
 - **CipherTrust (External):** A new key is first cloned on the external CipherTrust Manager. Then, this key material is uploaded to Salesforce to create a new Salesforce key. As the key material is uploaded from the external CipherTrust Manager, the key origin is **CipherTrust (External)**.

Creating/Uploading New Key Material

To add a Salesforce key by creating/uploading new key material:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**.
3. Click **Add Key**. The Select Material Origin screen of the Add Salesforce Key wizard is displayed.
4. Under **Select Method**, select **Create/Upload New Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following sources:
 - **CipherTrust (Local):** Refer to [Uploading CipherTrust \(Local\) Key Material](#) for details.
 - **Salesforce (Native):** Refer to [Creating Salesforce \(Native\) Key Material](#) for details.
 - **CipherTrust (External):** Refer to [Uploading CipherTrust \(External\) Key Material](#) for details.
 - **Vormetric DSM:** Refer to [Uploading Vormetric DSM Key Material](#) for details.

Refer to [Key Creation Methods and Sources](#) for details on key sources.

Uploading CipherTrust (External) Key Material

Upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin > Select CipherTrust Key

1. Select **CipherTrust (External)**.
2. Click **Next**. The Configure CipherTrust (External) Key screen is displayed.

Configure CipherTrust (External) Key

1. Select **Domain** from the drop-down list. The drop-down list shows the external CM domains linked with the configured external CM connection.
2. Enter a **Key Name**. A new key with this name will be created on the external CipherTrust Manager and its key material will be uploaded to Salesforce cloud.
3. Click **Next**.

Configure Salesforce Key

1. Select the desired **Organization** from the drop-down list. The new key will be uploaded to this organization.
2. Select the **Tenant Secret Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
3. (Optional) Select either of the following check boxes depending on your requirements:

- **Use Key Derivation**. This option is for BYOK tenant secrets only.

If you do not want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned ON (on Salesforce, **Security > Platform Encryption > Advanced Settings**), otherwise, the BYOK upload fails.

Enabling the **Allow BYOK to Opt Out of Key Derivation** option disables the Salesforce key derivation process and allows you to use your uploaded key material as the final encryption key.

However, if you want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned OFF on Salesforce.

- **Make this a cache-only key**. When you select this check box, the **Named Credential** field is displayed.

If you select **Make this a cache-only key**, ensure that the **Allow Cache-Only Keys with BYOK** option is turned ON on Salesforce. Enabling this option lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

For a non cache-only key (that is, when **Make this a cache-only key** is not selected), a BYOK-compatible certificate is mandatory. Refer to the next step.

4. Select the desired **Certificate** from the drop-down list.

The certificate that you select must be a BYOK-compatible 4096-RSA certificate. It can be a self-signed or CA-signed certificate. If the certificate does not meet these requirements, an error occurs and the key upload fails. Refer to [Generate a BYOK-Compatible Certificate](#) for details.

5. (Required if you selected **Make this a cache-only key**) Select the desired **Named Credential** from the drop-down list.
 6. Click **Next**. The Review and Add screen is displayed.
-

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.

The newly created key is displayed in the list of Salesforce keys.

Uploading CipherTrust (Local) Key Material

Upload the local key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select CipherTrust Key

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Configure CipherTrust (Local) Key screen is displayed.

Configure CipherTrust (Local) Key

1. Enter a **Key Name**. A new key with this name will be created on the CipherTrust Manager and its key material will be uploaded to Salesforce cloud.
2. Click **Next**.

Configure Salesforce Key

1. Select the desired **Organization** from the drop-down list. The new key will be uploaded to this organization.
2. Select the **Tenant Secret Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
3. (Optional) Select either of the following check boxes depending on your requirements:
 - **Use Key Derivation**. This option is for BYOK tenant secrets only.

If you do not want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key**

Derivation option is turned ON (on Salesforce, **Security > Platform Encryption > Advanced Settings**), otherwise, the BYOK upload fails.

Enabling the **Allow BYOK to Opt Out of Key Derivation** option disables the Salesforce key derivation process and allows you to use your uploaded key material as the final encryption key.

However, if you want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned OFF on Salesforce.

- **Make this a cache-only key.** When you select this check box, the **Named Credential** field is displayed.

If you select **Make this a cache-only key**, ensure that the **Allow Cache-Only Keys with BYOK** option is turned ON on Salesforce. Enabling this option lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

For a non cache-only key (that is, when **Make this a cache-only key** is not selected), a BYOK-compatible certificate is mandatory. Refer to the next step.

4. Select the desired **Certificate** from the drop-down list.

The certificate that you select must be a BYOK-compatible 4096-RSA certificate. It can be a self-signed or CA-signed certificate. If the certificate does not meet these requirements, an error occurs and the key upload fails. Refer to [Generate a BYOK-Compatible Certificate](#) for details.

5. (Required if you selected **Make this a cache-only key**) Select the desired **Named Credential** from the drop-down list.
6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.
-

The newly created key is displayed in the list of Salesforce keys.

Creating Salesforce (Native) Key Material

Create the key material directly using native Salesforce application.

Select Material Origin > Select Source

1. Select **Salesforce (Native)**.
2. Click **Next**. The Configure Salesforce Key screen is displayed.

Configure Salesforce Key

1. Select the desired **Organization** from the drop-down list.
2. Select the key **Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
3. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN and NATIVE KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **NATIVE KEY** section and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the NATIVE KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.

The newly created key is displayed in the list of Salesforce cloud keys. The origin of the key is **NATIVE**.

Uploading Vormetric DSM Key Material

Upload the key material using Vormetric DSM to configure the source key.

Select Material Origin > Select Source

1. Select **Vormetric DSM**.

-
- Click **Next**. The Configure DSM Key screen is displayed.

Configure DSM Key

- Enter a **DSM Key Name**. A new key with this name will be created on the DSM and its key material will be uploaded to the Salesforce cloud.
- (Optional) Provide a **Description** for the key.
- Select a **DSM Domain** for the key. The drop-down list shows the DSM domains linked with the configured DSM connection.
- Click **Next**.

Configure Salesforce Key

- Select the desired **Organization** from the drop-down list. The new key will be uploaded to this organization.
- Select the key **Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
- (Optional) Select either of the following check boxes depending on your requirements:

- **Use Key Derivation**. This option is for BYOK tenant secrets only.

If you do not want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned ON (on Salesforce, **Security > Platform Encryption > Advanced Settings**), otherwise, the BYOK upload fails.

Enabling the **Allow BYOK to Opt Out of Key Derivation** option disables the Salesforce key derivation process and allows you to use your uploaded key material as the final encryption key.

However, if you want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned OFF on Salesforce.

- **Make this a cache-only key**. When you select this check box, the **Named Credential** field is displayed.

If you select **Make this a cache-only key**, ensure that the **Allow Cache-Only Keys with BYOK** option is turned ON on Salesforce. Enabling this option lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

For a non cache-only key (that is, when **Make this a cache-only key** is not selected), a BYOK-compatible certificate is mandatory. Refer to the next step.

- Select the desired **Certificate** from the drop-down list.

The certificate that you select must be a BYOK-compatible 4096-RSA certificate. It can be a self-signed or CA-signed certificate. If the certificate does not meet these requirements, an error occurs and the key upload fails. Refer to [Generate a BYOK-Compatible Certificate](#) for details.

5. (Required if you selected **Make this a cache-only key**) Select the desired **Named Credential** from the drop-down list.
6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.

The newly created key is displayed in the list of Salesforce cloud keys.

Cloning Existing Key Material

To add a new Salesforce key by cloning key material existing on the CipherTrust Manager or the DSM:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**.
3. Click **Add Key**. The Select Material Origin screen of the Add Salesforce Key wizard is displayed.
4. Under **Select Method**, select **Clone Existing Key Material**. The **Select Source** section appears. Depending on your requirements, select from the following sources:
 - **CipherTrust (Local)**: Refer to [Cloning CipherTrust \(Local\) Key Material](#) for details.
 - **CipherTrust (External)**: Refer to [Cloning CipherTrust \(External\) Key Material](#) for details.
 - **Vormetric DSM**: Refer to [Cloning Vormetric DSM Key Material](#) for details.

Refer to [Key Creation Methods and Sources](#) for details on these key sources.

Cloning CipherTrust (External) Key Material

Clone and upload the key material of an external CipherTrust Manager key using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (External)**.
2. Click **Next**. The Select CipherTrust (External) Key screen is displayed.

Select CipherTrust (External) Key

1. **Select Domain** from the drop-down list. The drop-down list shows the external CM domains linked with the configured external CM connection.
2. Select the desired key from the **Select Key** drop-down list. This field shows the available external CipherTrust Manager keys.
3. Click **Next**. The Configure Salesforce Key screen is displayed.

Configure Salesforce Key

1. Select the desired **Organization** from the drop-down list. The new key will be uploaded to this organization.
2. Select the key **Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
3. (Optional) Select either of the following check boxes depending on your requirements:
 - **Use Key Derivation**. This option is for BYOK tenant secrets only.

If you do not want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned ON (on Salesforce, **Security > Platform Encryption > Advanced Settings**), otherwise, the BYOK upload fails.

Enabling the **Allow BYOK to Opt Out of Key Derivation** option disables the Salesforce key derivation process and allows you to use your uploaded key material as the final encryption key.

However, if you want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned OFF on Salesforce.

- **Make this a cache-only key**. When you select this check box, the **Named Credential** field is displayed.

If you select **Make this a cache-only key**, ensure that the **Allow Cache-Only Keys with BYOK** option is turned ON on Salesforce. Enabling this option lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

For a non cache-only key (that is, when **Make this a cache-only key** is not selected), a BYOK-compatible certificate is mandatory. Refer to the next step.

-
4. Select the desired **Certificate** from the drop-down list.

The certificate that you select must be a BYOK-compatible 4096-RSA certificate. It can be a self-signed or CA-signed certificate. If the certificate does not meet these requirements, an error occurs and the key upload fails. Refer to [Generate a BYOK-Compatible Certificate](#) for details.

5. (Required if you selected **Make this a cache-only key**) Select the desired **Named Credential** from the drop-down list.
6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.

The newly created key is displayed in the list of Salesforce keys.

Cloning CipherTrust (Local) Key Material

Clone and upload the local key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **CipherTrust (Local)**.
2. Click **Next**. The Select CipherTrust (Local) Key screen is displayed.

Select CipherTrust (Local) Key

1. Select the desired key from the **CipherTrust Key Name** drop-down list. This field shows the available local CipherTrust Manager keys.
 2. Click **Next**. The Configure Salesforce Key screen is displayed.
-

Configure Salesforce Key

1. Select the desired **Organization** from the drop-down list. The new key will be uploaded to this organization.
2. Select the key **Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
3. (Optional) Select either of the following check boxes depending on your requirements:

- **Use Key Derivation.** This option is for BYOK tenant secrets only.

If you do not want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned ON (on Salesforce, **Security > Platform Encryption > Advanced Settings**), otherwise, the BYOK upload fails.

Enabling the **Allow BYOK to Opt Out of Key Derivation** option disables the Salesforce key derivation process and allows you to use your uploaded key material as the final encryption key.

However, if you want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned OFF on Salesforce.

- **Make this a cache-only key.** When you select this check box, the **Named Credential** field is displayed.

If you select **Make this a cache-only key**, ensure that the **Allow Cache-Only Keys with BYOK** option is turned ON on Salesforce. Enabling this option lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

For a non cache-only key (that is, when **Make this a cache-only key** is not selected), a BYOK-compatible certificate is mandatory. Refer to the next step.

4. Select the desired **Certificate** from the drop-down list.

The certificate that you select must be a BYOK-compatible 4096-RSA certificate. It can be a self-signed or CA-signed certificate. If the certificate does not meet these requirements, an error occurs and the key upload fails. Refer to [Generate a BYOK-Compatible Certificate](#) for details.

5. (Required if you selected **Make this a cache-only key**) Select the desired **Named Credential** from the drop-down list.
6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and

DESTINATION KEY sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the DESTINATION KEY section becomes Complete and the Key ID link is displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.

The newly created key is displayed in the list of Salesforce keys.

Cloning Vormetric DSM Key Material

Clone and upload the DSM key material using the CipherTrust Manager to configure the source key.

Select Material Origin > Select Source

1. Select **Vormetric DSM**.
2. Click **Next**. The Select DSM Key screen is displayed.

Select DSM Key

1. Select the desired key from the **DSM Key Name** drop-down list. This field displays the available DSM keys.
2. Click **Next**. The Configure Salesforce Key screen is displayed.

Configure Salesforce Key

1. Select the desired **Organization** from the drop-down list. The new key will be uploaded to this organization.
2. Select the key **Type** from the drop-down list. The options are Data, EventBus, SearchIndex, DeterministicData, and Analytics.
3. (Optional) Select either of the following check boxes depending on your requirements:
 - **Use Key Derivation**. This option is for BYOK tenant secrets only.

If you do not want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned ON (on Salesforce, **Security > Platform Encryption > Advanced Settings**), otherwise, the BYOK upload fails.

Enabling the **Allow BYOK to Opt Out of Key Derivation** option disables the Salesforce key derivation process and allows you to use your uploaded key material as the final encryption key.

However, if you want to select **Use Key Derivation**, ensure that the **Allow BYOK to Opt Out of Key Derivation** option is turned OFF on Salesforce.

- **Make this a cache-only key.** When you select this check box, the **Named Credential** field is displayed.

If you select **Make this a cache-only key**, ensure that the **Allow Cache-Only Keys with BYOK** option is turned ON on Salesforce. Enabling this option lets Salesforce fetch remotely-stored encryption keys from an endpoint that you provide.

For a non cache-only key (that is, when **Make this a cache-only key** is not selected), a BYOK-compatible certificate is mandatory. Refer to the next step.

4. Select the desired **Certificate** from the drop-down list.

The certificate that you select must be a BYOK-compatible 4096-RSA certificate. It can be a self-signed or CA-signed certificate. If the certificate does not meet these requirements, an error occurs and the key upload fails. Refer to [Generate a BYOK-Compatible Certificate](#) for details.

5. (Required if you selected **Make this a cache-only key**) Select the desired **Named Credential** from the drop-down list.
6. Click **Next**. The Review and Add screen is displayed.

Review and Add

This screen shows the key details that you have provided. These details are divided into MATERIAL ORIGIN, SOURCE KEY, and DESTINATION KEY sections.

Before adding the key, review all details. After the key is added, certain features will no longer be editable.

1. Review the key details displayed on the screen.

If details are incorrect or you want to make any changes, click **Edit** next to the **SOURCE KEY** and **DESTINATION KEY** sections and update details. Alternatively, click **Back** and make changes, as appropriate.

2. Click **Add Key**.

The key creation starts. A Create Key In Progress message is displayed on the screen. Leave the window open until the process is completed.

When the status next to the SOURCE KEY and DESTINATION KEY sections becomes Complete and the Key ID links are displayed, the key is created successfully.

3. Click **Close**. The Add Salesforce Key wizard is closed.

The newly created key is displayed in the list of Salesforce cloud keys.

Viewing Salesforce Keys

The Salesforce Keys page shows the list of Salesforce keys available on the CipherTrust Manager. Search for keys by Organization ID or Organization Name. The Salesforce keys within an organization are categorized by data types.

To view the Salesforce keys:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**. The list of available Salesforce keys is displayed. The Salesforce Keys page displays the following details:

Field	Description
Organization Name	Name of the Salesforce organization where the key is created.
Organization ID	ID of the Salesforce organization where the key is created.
Data Type	Type of the key data. The data type can be: • Data in Salesforce • Deterministic • Search Index • Analytics • Event Bus
Version	Latest version of the Salesforce key.
Status	State of the Salesforce key. The status can be: • Active • Archived • Destroyed
Origin	Source of the key material. The origin of the key can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud.
Cache Only	Whether the key is a cache-only key. A cache-only key is indicated by a check mark (✓).
Backup	Whether the key material is downloaded from the Salesforce cloud to the CipherTrust Manager. A check mark (✓) shows that the key material is downloaded. The import operation enabled for such keys. A blank column indicates that the key material of the particular key is not downloaded from Salesforce. The import operation is not available for such keys.
Creation Date	Date and time when the Google Cloud key is

Field	Description
	created.

To view keys of a particular type under a Salesforce organization, click the expand icon (▶) to the left of the Organization Name link.

Sometimes, you might notice certain Salesforce keys are displayed as grayed out. This happens when the keys are no longer accessible. For example, when:

- Any cloud permissions on the keys are changed. The keys are no longer accessible from the Salesforce cloud connection.
- Connection is changed in KMS. The new connection does not have permissions to access the keys.

Refreshing Salesforce Keys

Refreshing is the process of downloading keys created in Salesforce organizations to CCKM. You can refresh keys from all Salesforce organizations at once.

To refresh keys:

1. Open the Cloud Key Manager application.
2. In the left pane, click **Cloud Keys > Salesforce**. The Salesforce Keys page is displayed. This page displays the list of Salesforce keys.
3. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all keys is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

4. Click **Refresh All** to continue.

A message Refresh started... is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

The refreshed keys are listed on the **Cloud Keys > Salesforce > Salesforce Keys** page.

Viewing Versions of a Key

To view the versions of a key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**.

3. Under Organization Name, click the expand icon () to the left of the desired key type. The key version details are displayed:

Field	Description
Data Type	Data type of the key.
Version	Version number of the key. All versions of the key are listed, each on a separate row.
Status	State of the Salesforce key. The status can be: • Active • Archived • Destroyed
Origin	Source of the key material. The origin of the key can be: • CCKM: Key material is created on CCKM. • Native: Key material is created on the cloud. • External (Unknown): Source of the key material is unknown. It is different than CCKM and the native cloud.
Cache Only	Whether the key is a cache-only key. A cache-only key is indicated by a check mark ().
Backup	Whether the key material is downloaded from the Salesforce cloud to the CipherTrust Manager. A check mark () shows that the key material is downloaded. The import operation enabled for such keys. A blank column indicates that the key material of the particular key is not downloaded from Salesforce. The import operation is not available for such keys.
Creation Date	Date and time when the Google Cloud key is created.

Alternatively, click the overflow icon () corresponding to the desired key, click **View/Edit**, and expand **KEY VERSIONS** to view key version details. You can also click the Organization Name, Organization ID, or Data Type link corresponding to desired key to view the key version details.

Destroying a Key Version

If required, you can destroy archived versions of a key. A destroyed version cannot operate on data. Destroy tenant secrets and key material if you no longer need access to related data. After a key material is destroyed, related data cannot be accessed unless you import previously exported key material.

A destroyed key version can be imported or deleted later.

To destroy an archived key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired archived version.
5. Click **Destroy**. The Destroy Key dialog box is displayed.
6. Click **Destroy** to confirm the action.

The state of the key version changes to Destroyed.

Importing a Destroyed Key Version

If required, you can import a destroyed version of a key. After a version is imported, its status becomes archived.

To import a key version:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**.
3. Click the expand icon () to the left of the desired key.
4. Click the overflow icon () corresponding to the desired destroyed version.
5. Click **Import**. The Import Key dialog box is displayed.
6. Click **Import** to confirm the action.

The state of the key version changes to Archived.

Deleting a Key Backup

You can delete the backup of a key from CCKM. After the key backup is deleted, it cannot be imported into the Salesforce cloud. Only the backup of a destroyed key can be deleted.

To delete a key backup:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Cloud Keys > Salesforce**.
 3. Click the expand icon () to the left of the desired key.
 4. Click the overflow icon () corresponding to the desired destroyed version.
 5. Click **Delete**. The Delete Backup dialog box is displayed.
-

6. Select **I wish to delete the backup of this key**.
7. Click **Delete Key Backup** to confirm the action.

The deleted key backup cannot be imported to the Salesforce cloud.

Activating a Cache-Only Key

Cache-only keys allow for an additional key status transition on Salesforce, from Destroyed to Active. This causes Salesforce to fetch the cache-only key material from CCKM.

The Salesforce API only allows CCKM to activate the *latest* version of the cache-only key. You cannot activate older versions.

To activate a cache-only key:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Cloud Keys > Salesforce**.
3. Click the expand icon (▶) to the left of the desired key.
4. Click the overflow icon (⋮) corresponding to the latest key version.
5. Click **Activate**.

Scheduling Operations

CCKM allows you to periodically refresh or rotate keys in the background. To refresh or rotate keys, you need to create schedule configuration. A schedule configuration defines when to run a refresh or rotation job. You can use either basic format or cron format to specify the time when the rotation or refresh job will run.

Specify basic format in the following order:

[Repeats, at]

Where,

- Repeats: frequency of the scheduler. Possible values are daily, weekly, monthly, and yearly.
- at: specific time at which the rotation or refresh operation will be performed. Possible value lies between 12:00-11:00 AM/PM UTC.

Specify cron format in the following order:

" * * * * * "

These five values indicate when the job should be executed. These values are mandatory and must be specified in order of minute, hour, day of month, month, and day of week.

The following table lists the accepted values:

Field	Allowed values	Allowed special characters
Minute	0-59	* / , -
Hour	0-23	* / , -
Day of month	1-31	* / , - ?
Month	1-12 or JAN-DEC	* / , -
Day of week	0-6 or SUN-SAT	* / , - ?

Adding Key Rotation Schedule

A key rotation schedule replaces selected keys with new cryptographic keys at the specified time.

To add key rotation schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
4. Select **Schedule Type** as **Key Rotation**.
5. Click **Next**.
6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Salesforce** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
 - Select **Enable Schedule** to enable the schedule.
 - Click **Next**.
7. On the **Schedule Config** screen, enter or select the following details.
 - a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate

keys. Select either **Basic** or **Raw (Cron)** format to specify the value.

- c. Configure **KEY SOURCE**. Select from the **Key Source** drop-down list. The options are Native, DSM, CipherTrust (Local), and CipherTrust (External). This will be the source of the new key material.
 - If the key source is DSM, you need to specify the DSM domain where the key will be created, the optional certificate whose public key will be used to encrypt the key, and whether to use key derivation.
 - If the key source is CipherTrust (Local) or CipherTrust (External), you can specify the optional certificate whose public key will be used to encrypt the key and whether to use key derivation.
- d. (Only for DSM and CipherTrust (External) key source) Select **Domain** where the key will be created to upload to Salesforce.
- e. Select **ORGANIZATION** to which the key belongs. Select from the **Organization** drop-down list.
- f. (Optional, only for DSM, CipherTrust (Local) and CipherTrust (External) key sources) Select the **Certificate** whose public key is to be used to encrypt the key.
- g. Configure **KEY TYPE**. Select the types of the key to be rotated. The options are Data, Event Bus, Search Index, Deterministic Data, and Analytics.
- h. (Optional) Select the **Use Key Derivation** check box. This field is not applicable to the Native key source.
- i. Click **Save**.

A message **Schedule successfully created** is displayed on the screen.

Adding Key Refresh Schedule

A key refresh schedule synchronizes keys from linked Salesforce cloud organizations to CCKM.

To add a key refresh schedule:

1. Open the **Cloud Key Manager** application.
 2. In the left pane, click **Schedules**. The list of available schedules is displayed.
 3. Click **Add Schedule**. The Add New Schedule wizard is displayed.
 4. **Select Schedule Type** as **Key Refresh**.
 5. Click **Next**.
 6. On the **General Info** screen, enter or select following details:
 - Enter a unique **Scheduler Name**.
 - Select **Salesforce** from the **Cloud Name** drop-down list.
 - Add **Description** for the scheduler in a maximum of 250 characters.
-

- Select **Enable Schedule** to enable the schedule.
- Click **Next**.

7. On the **Schedule Config** screen, enter or select the following details.

- a. Configure **DURATION** for the scheduler. Specify the schedule start and end time:
 - **Schedule Starts**: Specify time when the schedule starts.
 - **Schedule Ends**: Unavailable by default, that is, the scheduler never expires.
 - **Never**: Selected by default, that is, the scheduler configuration never expires.

To set an end time for the scheduler, clear the **Never** check box, and specify the **Scheduler Ends** time.

- b. Configure **FREQUENCY** of the scheduler. The frequency determines how often the scheduler will rotate keys. Select either **Basic** or **Raw (Cron)** format to specify the value.
- c. Click **Next**.

8. On the **Add Organization** screen:

- a. Select the desired organization from the **Refresh Keys from Selected Organization(s)** drop-down list.
- b. Click **+** button. Similarly, you can add more organizations. To remove an added organization, click the close (X) icon in the name of the added organization.

Alternatively, if you want to refresh all the existing organizations, select the **Refresh All Organizations** check box. When selected, the **Refresh Keys from Selected Organization(s)** field becomes unavailable.

- c. Click **Save**.

A message **Schedule successfully created** is displayed on the screen. The newly created scheduled is displayed in the schedules list.

Viewing/Editing Schedules

To view/edit a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The Schedules page displays following details:

Field	Description
Name	Unique name of the scheduler configuration.
Schedule Type	Type of the schedule. Possible types are: • Key Rotation

Field	Description
	• Key Refresh • Add KMS Container (GCP and Azure only)
Cloud Name	Name of the cloud.
Last Modified	Time when the schedule is modified.
Frequency	Frequency of the scheduler configuration.
Start Date	Creation time of the scheduler configuration.
End Date	Expiry time of the scheduler configuration. Never is displayed if the schedule is set to never expire.
Status	Status of the scheduler configuration. Possible values are: • Enabled • Disabled

- Click the overflow icon () corresponding to the desired schedule and click **View/Edit**.

Alternatively, click the **Name** link corresponding to the desired schedule.

- Edit or configure the following fields:

- Optional, basic description of the schedule.
- Status of the scheduler configuration. Select **Enable Schedule** to enable the schedule, clear to disable.
- Scheduler configuration parameters such as duration, frequency, and expiry time of the key. Refer to the key rotation [Schedule Config screen](#) or key refresh [Schedule Config screen](#), as appropriate for details.
- (For key refresh schedules only) Organizations whose keys you want to refresh. If you want to refresh all the existing organizations, select the **Refresh All Organizations** check box. When selected, the **Refresh Keys from Selected Organization(s)** field becomes unavailable.

- Click **Update** to save the changes.

The Schedules page also contains a section named **JOB HISTORY**. This section displays information related to a schedule such as **Run Date**, **Job ID**, **Status**, and **Errors**.

Disabling Schedules

To disable a schedule configuration:

- Open the **Cloud Key Manager** application.
- In the left pane, click **Schedules**. The list of available schedules is displayed.

-
3. Click the overflow icon () corresponding to the desired schedule and click **Disable**. The Disable Schedule message is displayed.
 4. Click **Disable Schedule**.

A message **Successfully disabled the schedule** is displayed on the screen.

Enabling Schedules

To enable a schedule configuration:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Enable**. The Enable Schedule message is displayed.
4. Click **Enable Schedule**.

A message **Successfully enabled the schedule** is displayed on the screen.

Manually Running Schedules

To manually run a schedule:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Run Now**.

The Run Now schedule is started in the background. A message **Schedule is running now. It will take a few seconds to finish.** is displayed on the screen. After the schedule is run successfully, a message **Successfully finished running the schedule** is displayed.

Deleting Schedules

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Schedules**. The list of available schedules is displayed.
3. Click the overflow icon () corresponding to the desired schedule and click **Delete Schedule**. The Delete Schedule message is displayed.
4. Click **Delete**.

A message **Successfully deleted schedule** is displayed on the screen.

Managing Salesforce Reports

CCKM provides options to generate key visibility reports based on key-related activities between CCKM and Salesforce organization. Salesforce supports the Key Activity Report.

Use the Key Activity Report to inspect individual Salesforce tenant secret (called key on CCKM GUI) histories by operations, for example, when they were refreshed, rotated, edited, or deleted. Also, use this report to compare key activities between CCKM and Salesforce organization.

Creating Salesforce Reports

To create a Salesforce report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Salesforce**. The Salesforce Reports page is displayed.
3. Click **Add Report**. The Choose Report Type and Name screen of the Add Salesforce Report wizard is displayed.
4. Select **Key Activity Report**.
5. Specify a **Report Name**. This is a mandatory field.
6. Click **Next**. The Choose Organization screen of the wizard is displayed.
7. Select a Salesforce organization from the **Organizations** drop-down list. The drop-down list contains the list of Salesforce organizations added to the CipherTrust Manager.
8. Click **Next**. The Set Start and End Dates screen of the wizard is displayed.
9. In the **Include Entries From** field, specify the start date and time for the report.
 - Click the field and select the date and time on the on-screen calendar.
 - Alternatively, enter the time in **MM/DD/YYYYHH : MM** format.
10. In the **To** field, specify the end date and time for the report.
11. Click **Save**.

A success message **Created report** is displayed. The newly created report is displayed under the Salesforce reports list. The report Run Date becomes *Running Now*. After the run is complete, the date and time of the run is displayed.

Viewing Salesforce Reports

The Salesforce Reports page displays the list of existing reports. Filter the reports by their names.

To view existing Salesforce reports:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Salesforce**. The list of available reports is displayed. The following details of the reports are displayed:

Column Name	Description
Report Name	Name of the report.
Run Date	When the report is run. If a report is running currently, Running Now is displayed.
Type	Type of the report is Key Activity Report.
Start Date	Start date from when the report is generated.
End Date	End date for the report.

Viewing Details of a Salesforce Report

To view the details of a Salesforce report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Salesforce**. The list of available reports is displayed.
3. Click the desired **Report Name** link.

Alternatively, click the overflow icon () corresponding to the desired report and click **View/Edit**.

The following details of the reports are displayed:

Column Name	Description
Key Name	Name of the key.
Key Version	Version of the key.
Organization ID	ID of the Salesforce organization.
Modified Date	When the report is modified.
CCKM Operation	CCKM operation performed. The operation can be TS Generated and TS Read.
Salesforce User	Name of the user on Salesforce.

Downloading Salesforce Reports

To download a Salesforce report as a CSV file:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Salesforce**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired report and click **Download**.

Alternatively, click the desired report under **Report Name**, and click **Download CSV** in the detail view.

The report is downloaded as a CSV file.

Deleting Salesforce Reports

To delete a Salesforce report:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **Reports > Salesforce**. The list of available reports is displayed.
3. Click the overflow icon () corresponding to the desired report and click **Delete**. The Confirm Delete Report message is displayed.
4. Click **Delete Report**.

The report is removed from the list of reports.

Managing Salesforce Cache-Only Key Endpoints

CipherTrust Cloud Key Manager (CCKM) can act as a key service for [Salesforce Shield Platform Encryption's Cache-Only Key Service](#). Salesforce fetches keys from CCKM endpoints on demand to immediately encrypt and decrypt data. The key material is securely transmitted through an authenticated channel. Salesforce then retains the key in the encrypted key cache until the cache is flushed.

You can provide a cache only key sourced from [local CipherTrust Manager](#) or [Data Security Manager \(DSM\)](#). Salesforce requires that the key algorithm is AES 256.

CCKM / CipherTrust Manager Prerequisites

- The CipherTrust Manager network location must be publicly accessible, with a Fully Qualified Domain Name (FQDN).
- The web interface must have a [TLS certificate signed by an external Certificate Authority \(CA\) trusted by Salesforce](#). Salesforce trusts certificates issued by well-known public CAs such as Verisign.
- The web interface port within CipherTrust Manager can be changed from the default port of 443 to another port. If you plan to change the default port for the CipherTrust Manager web interface, ensure to change it **BEFORE** configuring the Salesforce Cache-Only Key service on CCKM. Also reflect this port change when creating an endpoint for Salesforce Cache-Only Key on CCKM as part of the prerequisites for deploying Salesforce Cache-Only Key. **Changing the default port AFTER configuring Salesforce Cache-Only Key is not supported.**

- You must have a configured [Salesforce Connection](#) and associated [Salesforce organization](#).

Salesforce Prerequisite

Enable "Allow Cache-only Keys" in Platform Encryption Advanced Settings. Replay Detection is optional.

Prepare the Cache-Only Key Integration

1. Configure a [Salesforce Connection](#) and associated [Salesforce organization](#) if you have not already.
2. Create the endpoint. This endpoint is tied to a Salesforce organization, as identified by the organization ID generated and applied by CCKM. You must choose a username and password, which serve as the Named Credential for Salesforce communication to the endpoint, and a friendly name for the endpoint. You must also provide the base hostname for CipherTrust Manager.

```
ksctl cckm salesforce endpoints create --sfdc_organization_resource_id <CCKM-organization-id> --url_hostname <base-hostname-for-CipherTrust-Manager> --name <friendly-name> --epusername <username-for-Salesforce-communication> --eppassword <password-for-Salesforce-communication>
```

This functionality is also available in the CipherTrust Manager web console under **Cloud Key Manager > Salesforce Organizations**. Click a particular Organization, and expand **Endpoints**. Click **Add Cache-Only Key Endpoint**.

When the endpoint is created, a unique ID is generated, and the endpoint is available for Salesforce at a URL of `https://<ciphertrust-hostname>/api/v1/cckm/sfdc/endpoints/<unique-id>/keys/`

Note

If you changed the web interface port within CipherTrust Manager from the default port of 443 to another port, ensure to add that same port number when configuring the Cache-Only Key Endpoint by specifying the new port number along with the hostname. For example, `example.com:8443`.

3. Associate at least one certificate with the Salesforce organization in CCKM.

- To create a new certificate.

```
ksctl cckm salesforce certificates add --name <certificate-name> --sfdc_organization_resource_id <CCKM-organization-ID>
```

This functionality is also available in the CipherTrust Manager web console under **Cloud Key Manager > Salesforce Organizations**. Click a particular Organization, and expand **Certificates**. Click **Add**

Certificate and provide a Name.

- To use a certificate already present in Salesforce, synchronize the certificates from the Salesforce organization.

```
ksctl cckm salesforce certificates synchronization-jobs start --sfdc_organization_resource_ids <CCKM-organization-id> --synchronize_all false
```

This functionality is also available in the CipherTrust Manager web console under **Cloud Key Manager > Salesforce Organizations**. Click a particular Organization, and expand **Certificates**. Click **Refresh All**.

4. Add the Named Credential in [Salesforce console](#):
 - a. Specify the endpoint URL.
 - b. For Authentication, specify **Identity Type** as **Named Principal** and **Authentication Protocol** as Password Authentication.
 - c. Add the username and password you associated with the endpoint in CCKM.
5. Return to CCKM to upload a cache-only key associated with the Named Credential to Salesforce. This cache-only key becomes a tenant secret on Salesforce, with meta data retained.
6. To use the CLI to upload an existing key from [local CipherTrust Manager](#) or [Data Security Manager \(DSM\)](#).
 - a. Fetch the named credential from Salesforce. You require the organization ID generated and applied by CCKM.

```
ksctl cckm salesforce endpoints get-named-credentials --sfdc_organization_resource_id <organization-id>
```

The 18-digit value returned in the **id** field is the relevant value. For example, **0XA3h000000L0D5GAK** is the named credential ID in the following response.

```
{
  "totalSize": 1,
  "done": true,
  "records": [
    {
      "attributes": {
        "type": "NamedCredential",
        "url": "/services/data/v52.0/subjects/NamedCredential/0XA6h000000L0D7GAK"
      },
      "Endpoint": "https://test.com/kmaas/byok/00D7X000000EM3TEA8/"
    }
  ]
}
```

```

    "id": "0XA3h000000L0D5GAK",
    "IsDeleted": false,
    "MasterLabel": "test-namedcredential-1",
    "DeveloperName": "test-namedcredential-1"
  }
],
"organizationId": "a916ba75-242b-4f29-b886-52bf51d70e16"
}

```

b. Upload the key. You must provide the following values:

- **Organization ID.** This is the organization ID generated and applied by CCKM.
- **Type:** Type for tenant secret. One of Data, EventBus, SearchIndex, DeterministicData and Analytics. This depends on the Salesforce encryption purpose for the cache-only key.
- **Source for the key:** One of **local** (from CipherTrust Manager) or **dsm** (from Data Security Manager).
- **The key ID**
- **The certificate ID**
- **The named credential ID** from step A.

```

ksctl cckm salesforce keys upload-cache-only-key --sfdc_organization_resource_id <organization-id> --name <key-name> --type <tenant-secret-type> --source-key-tier <source-of-cache-only-key> --source-key-identifier <key-id> --certificate-id <certificate-associated-with-organization> --sfdc-namedcredential-id <named-credential-id>

```

7. Alternatively, you can use the CipherTrust Manager web console to create a new key or upload an existing key from CipherTrust Manager or DSM. Follow the steps to create a tenant secret for [CipherTrust Manager](#) or [DSM](#), making sure to select the option to **Make this a cache-only key**, and provide **Certificate** and **Named Credential**.

Note

The option presented in the CipherTrust Manager GUI to create a **Salesforce (Native)** key cannot create cache-only keys.

At this point, you can manage the cache-only key using CCKM's [Salesforce Tenant Secret](#) menus and commands.

View a Salesforce Cache-Only Key Endpoint

You can view a Salesforce cache-only key endpoint through the CipherTrust Manager GUI, CLI, or REST API. An endpoint's URL is needed for Salesforce to make requests to the endpoint.

- In the GUI, Salesforce cache-only key endpoints are grouped under their organizations. Navigate to **Cloud Key Manager > Salesforce Organizations**. Click a particular Organization, and expand **Endpoints**.
- In the CLI, Salesforce cache-only key endpoint details can be retrieved using a variety of identifiers.

To view a single endpoint:

```
ksctl cckm salesforce endpoints get --id <endpoint-id>
```

To view all endpoints:

```
ksctl cckm salesforce endpoints list
```

To return multiple endpoints filtered on name, organization name, organization ID, or organization resource ID.

```
ksctl cckm salesforce endpoints list [--name <endpoint-id> --organization-name  
<org-name> --sfdc_organization_id <organization-ID> --sfdc_organization_resourc  
e_id <organization-resource-id> ]
```

- In the REST API, use `GET /v1/cckm/sfdc/endpoints` to list details for all endpoints, and `GET /v1/cckm/sfdc/endpoints/{id}` to list details for a specific endpoint.

Edit a Salesforce Cache-Only Key Endpoint

You can edit a Salesforce cache-only key endpoint through the CipherTrust Manager GUI, CLI, or REST API. You can change the base hostname, and the username and password that correspond to the **Named Credential** in Salesforce. In the GUI, you can also update the friendly name corresponding to the password.

- In the GUI, Salesforce cache-only key endpoints are grouped under their organizations.
 - a. Navigate to **Cloud Key Manager > Salesforce Organizations**.
 - b. Click a particular Organization, and expand **Endpoints**.
 - c. Click the overflow icon () corresponding to the desired endpoint, and click **Edit**.
- In the CLI, Salesforce cache-only key endpoints can be edited using the endpoint ID.

```
ksctl cckm salesforce endpoints update --id <endpoint-id> [ --url_hostname <bas  
e-hostname> --epusername <named-credential-username> --eppassword <named-creden  
tial-password>]
```

- In the REST API, use `PATCH /v1/cckm/sfdc/endpoints/{id}` to edit the endpoint.

Delete a Salesforce Cache-Only Key Endpoint

You can delete a Salesforce cache-only key endpoint through the CipherTrust Manager GUI, CLI, or REST API. This makes the endpoint inaccessible to Salesforce, and the cache-only key becomes unusable on Salesforce. Make sure that Salesforce applications are no longer using a cache-only key before deleting a Salesforce cache-only key endpoint.

- In the GUI, Salesforce cache-only key endpoints are grouped under their organizations.
 - a. Navigate to **Cloud Key Manager > Salesforce Organizations**.
 - b. Click a particular Organization, and expand **Endpoints**.
 - c. Click the overflow icon () corresponding to the desired endpoint, and click **Delete**.
- In the CLI, Salesforce cache-only key endpoints can be deleted using the endpoint ID.

```
ksctl cckm salesforce endpoints delete --id <endpoint-id>
```

- In the REST API, use `DELETE /v1/cckm/sfdc/endpoints/{id}` to delete the endpoint.

Managing Certificates from Salesforce Organizations

This section describes how to manage the certificates of a Salesforce organization within CCKM. Certificates within a Salesforce organization can be added, viewed, and deleted from the **Certificates** section of the **Salesforce Organizations** page.

Adding a New Certificate to an Existing Salesforce Organization

In CCKM, you have the ability to add a new certificate to an existing Salesforce organization. Before proceeding, ensure the Salesforce organization is added to CCKM. Refer to [Managing Salesforce Organizations](#) for more information.

To add a new certificate to a Salesforce organization:

1. Open the **Cloud Key Manager** application.
2. In the left pane, click **KMS Containers > Salesforce Organizations**. The Salesforce Organizations page shows the list of organizations added to the CipherTrust Manager.
3. Click the **Organization Name** link of the desired organization.

Alternatively, click the overflow icon () corresponding to the desired organization, and click **View/Edit Details**.

The edit view of the Salesforce Organizations page shows additional details of the selected organization under the **ACCESS CONTROL**, **CERTIFICATES**, **ENDPOINTS**, and **CONNECTION** sections.

4. Expand the **CERTIFICATE** section. The **CERTIFICATE** section expands to show additional details for certificates.
5. Click **Add Certificate**. The **Add Certificate** is displayed along with the name of the organization name.
6. Enter the name of the certificate in the **Name** field.
7. Click **Add**.

The new certificates are displayed on the **CERTIFICATE** section. Now, you can manage this new certificate from CCKM on the CipherTrust Manager.

Viewing an Organization's Certificates

To view an organization's certificates:

1. Perform steps 1 through 4 in [Adding a New Certificate to an Existing Salesforce Organization](#).
2. The **CERTIFICATE** section displays the following certificate details:

Column	Description
Name	Name of the certificate.
Subject	The owner or user of the certificate.
Valid From	The start date of the certificate's validity period.
Valid To	The end date of the certificate's validity period.
Issuer	The CA that issued the certificate.

Viewing Details of an Organization's Certificate

The **Details** page provides a table with a list of all of the properties of a certificate along with the values for each including the organization ID, organization name, Salesforce organization ID, and key size.

To view the details of an organization's certificate:

1. Perform steps 1 through 4 in [Adding a New Certificate to an Existing Salesforce Organization](#).
2. Click the overflow icon () corresponding to the certificate for which to view the details.
3. Click **Details**. The **Details** page is displayed.

Refreshing All Certificates for an Organization

When you wish to retrieve new certificates created in Salesforce and download these to CCKM, you can use **Refresh All** from the **CERTIFICATE** section. Thereafter, the refreshed certificates display within the section.

To refresh all certificates for a Salesforce organization:

1. Perform steps 1 through 4 in [Adding a New Certificate to an Existing Salesforce Organization](#).
2. Click **Refresh All**. The **This may take a while...** message is displayed.

Note

Refresh all organization certificates is a time intensive operation that could take several hours or days to complete. It will continue running in the background.

3. Click **Refresh All** to continue.

A message **Refresh started...** is displayed on the screen. To cancel the refresh, click **Cancel Refresh**.

After the Refresh is completed, a message **Refresh Completed** is displayed on the screen, and the refreshed certificates are listed within the CERTIFICATE section.

Removing an Organization's Certificate

Using CCKM, you can remove or delete certificates from an organization.

To remove a certificate from an organization:

1. Perform steps 1 through 4 in [Adding a New Certificate to an Existing Salesforce Organization](#).
2. Click the overflow icon () corresponding to the certificate to remove.
3. Click **Delete**. The **Delete Certificate** dialog box displays.

A message **Are you sure you want to delete?** is displayed on the screen. To cancel the deletion, click **Cancel**.

4. Click **Delete** to confirm the deletion.

The certificate is deleted successfully, and it is removed from the list of organization certificates.

Migrate from CCKM Appliance

This section describes steps to export migration data from a CCKM Appliance to CCKM on a CipherTrust Manager (referred to as CCKM Embedded).

Before proceeding with migration:

- Note that the origin of migrated keys might not match between the CCKM Embedded and CCKM Appliance due to different terminologies used by these solutions.
- Pause all the schedules in the CCKM Appliance until the migration is complete, otherwise, the CCKM Appliance and CipherTrust Manager might have data mismatch after migration. After the migration is

successful, you should enable all the schedules on the CipherTrust Manager.

- Ensure the CCKM Appliance is in sync with the configured clouds.
- If the CCKM Appliance is in a cluster, you need to perform migration **only** on any one node.

Minimum Supported Versions

- CCKM Appliance 1.10.4
- Data Security Manager 6.4.3

Note

Data Security Manager (DSM) is EOL as of June 2024 and its support as a key source is being deprecated.

- CipherTrust Manager 2.13.0

Supported Clouds

The migration only supports **AWS Cloud**, **Azure Cloud**, **Google Cloud**, **Salesforce**, and **Salesforce Sandbox** data.

Note

Migration of IBM Cloud and Salesforce Government Cloud data is not supported.

Prerequisites

- CCKM Appliance is configured with a supported version of key source (DSM or CipherTrust Manager)
- IP address, admin credentials, and SSL certificate of the CCKM Appliance
- CCKM Appliance is accessible from the CipherTrust Manager. By default, the CipherTrust Manager connects to the CCKM Appliance on port 443. If the CCKM Appliance is not running on the default port (443), you need to specify the custom port along with the IP address in the steps described below.
- DSM servers are accessible from the CipherTrust Manager
- The CipherTrust Manager is backed up (for rollback, if required)

Scenarios

1. Migrate cloud keys with DSM as key source, move source keys to a local CM

The steps below apply to root domain only. To perform migration on a child domain, refer to [Migration from CCKM Appliance to Child Domain](#).

Generate RSA Key Pair

Exporting migration data from CCKM Appliance requires an RSA key pair (public and private) on the CipherTrust Manager. The public key is used to encrypt the data while the private key is used to decrypt the exported data.

To generate an RSA key pair, run the `ksctl keys create` command:

```
./ksctl-linux-amd64 keys create --name <rsa-key-name> --alg <key-algorithm> --size <key-size>
```

Here,

- `--name`: Name for RSA key pair.
- `--alg`: Algorithm for the RSA key pair.
- `--size`: Size for the key pair.

Example:

```
./ksctl-linux-amd64 keys create --name rsa-key --alg RSA --size 4096
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",

  }

```

In the sample output above, "sourceID":

"b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1" is the private key ID. The "targetID":

"bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395" under "links" is the public key ID, which is used to download the export file.

Download Export File

As a CipherTrust Manager administrator, download the migration data (the export file) from the CCKM Appliance. This file contains migration data to be uploaded to CCKM Embedded.

Run the command:

```
./ksctl-linux-amd64 migrations download --cckm-host "<cckm-ip-or-hostname>" --cckm-user "<cckm-user>" --cckm-certificate "<certificate-file-content>" --public-key-id "<public-key-id>"
```

Here,

- **--cckm-host**: IP address or hostname of the CCKM Appliance.
- **--cckm-user**: Admin user of the CCKM Appliance.
- **--cckm-certificate**: SSL certificate downloaded from the CCKM Appliance.

By default, the content of the SSL certificate spans over multiple new lines. However, to input the certificate as an inline argument, the certificate content needs to be converted into the single-line format where every new line is represented by `\n`.

To convert the certificate into the single-line format:

- a. Download the certificate in a file (say `certificate.cert`).
- b. Store the certificate file at a location on your machine, for example, at `/root/cert/`.
- c. Run the following command:

```
awk 'NF {sub(/\r/, ""); printf "%s\\n",$0;}' <full-path-to-certificate-file>
```

For example, to convert your certificate file (`/root/cert/certificate.cert`), run the command:

```
awk 'NF {sub(/\r/, ""); printf "%s\\n",$0;}' /root/cert/certificate.cert
```

The above command returns the certificate in the single-line format, as shown below:

```
-----BEGIN CERTIFICATE-----\nMIIDhjCCAm6gAwIBAgIGCBPpf2sUMA0GCSqGSIb3DQEBAU  
AMC8xIDAeBgNVBAMT\nF0NHIENBIFMgb24gcGt2LWNsdXN0ZXIxMQswCQYDVQQGEWJVUzAeFw0yM  
TAzMMDMw\nNzI0MDVaFw0zMTAzMDQwNzI0MDVaMCQxFTATBgNVBAMTDHBrdi1jbHVzdGVyMTEl\nnMAkGA1UEBhMCVVMwggEiMA0GCSqGSIb3DQEBAQUAA4IBDwAwggEKAoIBAQD0h14c\n\nhxamUh7eO/T
```

```

es0v8/XeGvzkuy55dT07SwhLGTkiuv5L2ADawGQmLnQ7thNUN2P\n-----END CERTIFICAT
E-----\n

```

- d. Copy the returned single-line certificate content. You need to paste this content as the value for `--cckm-certificate`.

- `--public-key-id`: ID of the local (public) key of the RSA key pair generated in [Generate RSA Key Pair](#).

The command prompts for the password. Enter the password of the CCKM Appliance user (`cckm-user`).

Example:

```

./ksctl-linux-amd64 migrations download --cckm-host "127.0.0.1" --cckm-user "admin" --cckm-certificate "-----BEGIN CERTIFICATE-----\nMIIDhjCCAm6gAwIBAgIGCBPpf2sU

a246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395"

```

Output:

```

CCKM enterprise user password:
File is downloading.
File downloaded successfully: migration_20210621143427.json

```

An export file named `"migration_<TIMESTAMP>.json"` (for example, `migration_20210621143427.json`) is created and downloaded to your machine.

Note

After downloading the migration data (the export file), open the file and check whether it contains a `"containers"` tag at the beginning of the file.

Upload Export File

As a CipherTrust Manager administrator, upload the downloaded export file to CCKM Embedded.

Run the command:

```
./ksctl-linux-amd64 migrations upload --file <export-file-name>
```

Here,

- **--file**: Name of the export file.

Example:

```
./ksctl-linux-amd64 migrations upload --file migration_20210621143427.json
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",
  "checksum_sha256": "3e853d19e1d4a3687dfcf7bde5fc6bb192c19345462c5f4ae05c481acf26968b",
  "product": "CCKM"
}
```

Note down the "id" value, "26304f13-5626-419b-bd81-459fda7fdb68". It is required when applying the migration data. Now, you need to apply the migration data to CCKM Embedded (refer to [Migrate Complete Data](#)).

Apply Migration Data

The migration data can be applied to CCKM Embedded in two ways:

- [Migrate Data of Set of Containers](#)
- [Migrate Complete Data](#)

Note

- In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.
- After migration, all the source keys from DSM will be migrated to the current domain on the CipherTrust Manager (where the migration is being performed).

- Even if you migrate specific KMS containers, all of the DSM source keys will be migrated.
- After all the source keys are moved to the CipherTrust Manager, you can remove DSM from CCKM Embedded, if needed. Refer to [Deleting DSM Domains](#) and [Deleting a DSM Connection](#).

Migrate Data of Set of Containers

This method requires a list of containers. After the exported file is uploaded to the CipherTrust Manager, you can get the list of containers and select the containers to be migrated.

To migrate the data of a set of containers:

1. List the migrated containers.

Run the command:

```
./ksctl-linux-amd64 migrations containers list -id <export-file-id>
```

Here,

- **--id**: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.

Example:

```
./ksctl-linux-amd64 migrations containers list --id 26304f13-5626-419b-bd81-459fda7fdb68
```

Output:

```
{
  "Containers": [
    {
      "id": "b10ba3f2-b835-485d-b09a-07d4c002ff97",
      "type": "aws",
      "name": "805182230944",
      "tenant": "805182230944"
    },
    {
      "id": "0de664f3-7c70-4fae-9213-4e16bb99a4fc",
      "type": "aws",
```

```

        "name": "556782317223",
        "tenant": "556782317223"
    },
    {
        "id": "3f2b09ba-485d-b835-b09a-07d4c002ff97",
        "type": "salesforce",
        "name": "0056A0000011XDvQAM",
        "tenant": "0056A0000011XDvQAM"
    },
    {
        "id": "4f4b11ba-c385-456d-b09a-07d4c002ff97",
        "type": "salesforcesandbox",
        "name": "0056A0000011ABvZCM",
        "tenant": "0056A0000011ABvZCM"
    },
    {
        "id": "0941754d-9cb9-4b32-a241-59f7a4703756",
        "type": "azure",
        "name": "pkv-premium",
        "tenant": "d27d849e-e487-4b0e-a54c-a71e67687d10"
    }
}

```

This command returns the list of containers with their IDs. From this list, you can select the containers to be migrated.

2. Select the desired containers to be migrated. In this example, we will migrate the containers with the IDs `"b10ba3f2-b835-485d-b09a-07d4c002ff97"` and `"0941754d-9cb9-4b32-a241-59f7a4703756"`.
3. Apply the migration to migrate the desired container.

Run the command:

```

./ksctl-linux-amd64 migrations apply --id <export-file-id> --private-key-id <private-key-id> --migrate-cckm-source-keys --containers "<container1-id>,<container2-id>,...,<containerN-id>"

```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.
- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.

- `--migrate-cckm-source-keys`: Tag to migrate the source keys.
- `--containers`: Comma-separated container IDs.

Example:

```
./ksctl-linux-amd64 migrations apply --id 26304f13-5626-419b-bd81-459fda7fdb68
--private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c3
3c1 --migrate-cckm-source-keys --containers "b10ba3f2-b835-485d-b09a-07d4c002f
f97,0941754d-9cb9-4b32-a241-59f7a4703756",
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460a
a9cd65383e",
  "product": "CCKM"
}
```

The container migration data is applied. It might take some time to complete. Verify the migration status. Refer to [Check Migration Status](#) for details.

Migrate Complete Data

To migrate the complete data, run the command:

```
./ksctl-linux-amd64 migrations apply --id <export-file-id> --private-key-id <priv
ate-key-id> --migrate-cckm-source-keys
```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.
- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.
- `--migrate-cckm-source-keys`: Tag to migrate the source keys.

Example:

```
./ksctl-linux-amd64 migrations apply --id 26304f13-5626-419b-bd81-459fda7fdb68 --
private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1
--migrate-cckm-source-keys
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460aa9c
d65383e",
  "product": "CCKM"
}
```

Check Migration Status

After you have applied the migration data, verify the migration status by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "9c9149ad-901b-405f-aefd-b279e6257f97",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfmc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 }
}
```

}

In the sample output above, `"overall_status": "Completed"` indicates that migration of CCKM Appliance to CCKM Embedded is successful. Also, verify that migration status of different clouds and key sources such as `"cckm_azure_keys"`, `"cckm_aws_keys"`, and `"cckm_dsm_keys"` is `"Completed"`.

In the output, `"num_ignored"` indicates the number of Azure keys for which blobs are present on the DSM but the keys have been deleted.

After the migration status is `"Completed"`, you can add connection to supported clouds to perform operations on the added data.

After migration, you can see the migrated keys on the Keys page of the CipherTrust Manager GUI. The migrated keys are added with the prefix `Migration-DSM-`.

Add Connection

Add connection to the desired clouds on the CipherTrust Manager. Refer to [Connection Manager](#) for details on connection management.

Update Containers

After the connection is created, update connection in AWS KMS, Azure key vaults, Salesforce organizations, and Google key rings on the Containers tab. After the update, keys in supported clouds can be managed from CCKM Embedded.

For **Salesforce**, you also need to synchronize certificates and update endpoints linked with the organizations.

- **Synchronize certificates:** After migration, the certificates linked with the cache-only keys and schedulers are not synchronized. You need to manually synchronize them on CCKM. Refer to [Prepare the Cache-Only Key Integration](#) for details.
- **Update endpoints:** The endpoint URLs used in Named Credentials for cache-only keys before migration will not work after migration. This is because the Callout URL check performed by Salesforce while fetching the cache-only keys will fail. So, you need to update the endpoint URLs in Named Credential on Salesforce and create the same endpoints on CCKM.

Alternatively, you can create new endpoint URLs on Salesforce and CCKM and use them.

Refer to [Prepare the Cache-Only Key Integration](#) and [Edit a Salesforce Cache-Only Key Endpoint](#) for details.

2. Migrate cloud keys with DSM as key source, move source keys to an External CipherTrust Manager

Migrate Source Keys from DSM to external CipherTrust Manager

To migrate the source keys from DSM to the external CipherTrust Manager:

1. Download the CLI tool (`ksctl`).
2. Log on to the external CipherTrust Manager.

```
ksctl login --user <username> --password <password> --url <External Cipher
Trust Manager URL> --days <number of days> --hours <number of hours> --yes
--domain <domain-name-or-id>
```

3. Generate an RSA key pair and note down the private and public key IDs.

```
ksctl keys create --name <key name> --alg RSA --size 2048
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",

  }

```

4. Download the migration data from the CCKM Appliance.

```

ksctl migrations download --cckm-host <cckm-host> --cckm-user <cckm-user>
--cckm-certificate <cckm-certificate> --public-key-id <public-key-id>

```

Output:

```
CCKM enterprise user password:
File is downloading.
File downloaded successfully: migration_20210621143427.json
```

5. Upload the migration data to the CipherTrust Manager.

```
ksctl migrations upload --file <downloaded migrations filename>
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",

  "product": "CCKM"
}
```

6. List all containers from the uploaded migration file.

```
ksctl migrations containers list --id <migrations file resource id>
```

Output:

```
{
  "Containers": [
    {
      "id": "b10ba3f2-b835-485d-b09a-07d4c002ff97",
      "type": "aws",
      "name": "805182230944",
      "tenant": "805182230944"
    },
    {
      "id": "0de664f3-7c70-4fae-9213-4e16bb99a4fc",
      "type": "aws",
      "name": "556782317223",
      "tenant": "556782317223"
    }
  ]
}
```

```

        "id": "3f2b09ba-485d-b835-b09a-07d4c002ff97",
        "type": "salesforce",
        "name": "0056A0000011XDvQAM",
        "tenant": "0056A0000011XDvQAM"
    },
    {
        "id": "4f4b11ba-c385-456d-b09a-07d4c002ff97",
        "type": "salesforcesandbox",
        "name": "0056A0000011ABvZCM",
        "tenant": "0056A0000011ABvZCM"
    },
    {
        "id": "0941754d-9cb9-4b32-a241-59f7a4703756",
        "type": "azure",
        "name": "pkv-premium",
        "tenant": "d27d849e-e487-4b0e-a54c-a71e67687d10"
    }
}

```

7. Apply migration.

Note

- In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.
- After migration, all the source keys from DSM will be migrated to the current domain on the CipherTrust Manager (where the migration is being performed).
- After all the source keys are moved to the CipherTrust Manager, you can remove DSM from CCKM Embedded, if needed. Refer to [Deleting DSM Domains](#) and [Deleting a DSM Connection](#).

To apply the migration data, run the command:

```
ksctl migrations apply --id <migrations file resource id> --private-key-id
<RSA private key id> --migrate-only-cckm-source-keys
```

Output:

```

{
    "id": "26304f13-5626-419b-bd81-459fda7fdb68",

```

```

    "file_size": 22940401,
    "created_at": "2021-05-06T14:19:54.76812635Z",
    "status": "In progress",
    "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d08529    13c0fb3a54f584c284
60aa9cd65383e",
    "product": "CCKM"
  }

```

8. Check the migration status.

```
ksctl migrations status
```

Output:

```

{
  "id": "9c9149ad-901b-405f-aefd-b279e6257f97",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfdc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 }
}

```

Note

- Run the `migrations apply` command with the `migrate-only-cckm-source-keys` flag. Only the source keys from DSM will be migrated to the CipherTrust Manager without migrating cloud keys.
- The `migrate-only-cckm-source-keys` flag is optional and is applicable to the CCKM Appliance migrations only.

Migrate Cloud Keys to the CipherTrust Manager

Prerequisites for Migration

- Source keys from DSM are migrated to the external CipherTrust Manager.
- After migrating the DSM source keys to the external CipherTrust Manager, assign the **Key Admins** permission to the client CipherTrust Manager. Refer to [Add the Client](#) for details.

Migration Steps

To migrate the cloud keys to the CipherTrust Manager:

On the CipherTrust Manager

1. Configure the *external* CipherTrust Manager as a key source.
 - a. Add the external CipherTrust Manager connection. Refer to [CM Connection/External CM](#).
 - b. Add the *external* CipherTrust Manager domains where the DSM source keys were migrated.
 - c. Refresh the CipherTrust domains added to the CipherTrust Manager.
2. Download the CLI tool (`ksctl`).
3. Log on to the CipherTrust Manager.

```
ksctl login --user <username> --password <password> --url <CipherTrust Manager URL> --days <number of days> --hours <number of hours> --yes --domain <domain-name-or-id>
```

4. Generate an RSA key pair and note down the private and public key IDs.

```
ksctl keys create --name <key name> --alg RSA --size 2048
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",

    "muid": "4b9e7c53-40d7-44b7-9fa1-31cf8d0237d3e129ed33-317d-4584-9cbf-d0e88
2f58fca"
}

```

5. Download the migration data from the CCKM Appliance.

```

ksctl migrations download --cckm-host <cckm-host> --cckm-user <cckm-user>
--cckm-certificate <cckm-certificate> --public-key-id <public-key-id>

```

Output:

```

CCKM enterprise user password:
File is downloading.
File downloaded successfully: migration_20210621143427.json

```

6. Upload the migration data to the CipherTrust Manager.

```
ksctl migrations upload --file <downloaded migrations filename>
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",
  "checksum_sha256": "3e853d19e1d4a3687dfcf7bde5fc6bb192c19345462c5f4ae05c481acf26968b",
  "product": "CCKM"
}
```

7. List all containers from the uploaded migration file.

```
ksctl migrations containers list --id <migrations file resource id>
```

Output:

```
{
  "Containers": [
    {
      "id": "b10ba3f2-b835-485d-b09a-07d4c002ff97",
      "type": "aws",
      "name": "805182230944",
      "tenant": "805182230944"
    },
    {
      "id": "0de664f3-7c70-4fae-9213-4e16bb99a4fc",
      "type": "aws",
      "name": "556782317223",
      "tenant": "556782317223"
    },
    {
      "id": "3f2b09ba-485d-b835-b09a-07d4c002ff97",
      "type": "salesforce",
      "name": "0056A0000011XDvQAM",
      "tenant": "0056A0000011XDvQAM"
    },
    {
      "id": "4f4b11ba-c385-456d-b09a-07d4c002ff97",
      "type": "salesforcesandbox",
      "name": "0056A0000011ABvZCM",

```

```

        "tenant": "0056A0000011ABvZCM"
      },
      {
        "id": "0941754d-9cb9-4b32-a241-59f7a4703756",
        "type": "azure",
        "name": "pkv-premium",
        "tenant": "d27d849e-e487-4b0e-a54c-a71e67687d10"
      }
    ]
  }
}

```

8. Apply migration.

Note

In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.

To apply the migration data, run the command:

```
ksctl migrations apply --id <migrations file resource id> --private-key-id
<RSA private key id> --migrate-cloudkeys-with-externalcm
```

Output:

```

{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460a
a9cd65383e",
  "product": "CCKM"
}

```

9. Check the migration status.

```
ksctl migrations status
```

Output:

```
{
  "id": "9c9149ad-901b-405f-aefd-b279e6257f97",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfmc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 }
}
```

Note

- Run the `migrations apply` command with the `migrate-cloudkeys-with-externalcm` flag. Only the cloud keys will be migrated to the CipherTrust Manager without migrating the DSM source keys.
- The `migrate-cloudkeys-with-externalcm` flag is optional and is applicable to the CCKM Appliance migrations only.
- If the migration data contains Salesforce schedules, then after migration, update the external CipherTrust Manager domain in the Salesforce schedules.

3. Migrate cloud keys but keep using DSM as key source

This section provides instructions to migrate *only* the cloud keys from a CCKM Appliance to a CipherTrust Manager. Before proceeding, read the [prerequisites](#).

Note

The user who performs the migration becomes the owner of the migrated keys.

The steps above apply to the root domain only. To perform migration on a child domain, refer to [Migration from CCKM Appliance to Child Domain](#).

Generate RSA Key Pair

Exporting migration data from CCKM Appliance requires an RSA key pair (public and private) on the CipherTrust Manager. The public key is used to encrypt the data while the private key is used to decrypt the exported data.

To generate an RSA key pair, run the `ksctl keys create` command:

```
./ksctl-linux-amd64 keys create --name <rsa-key-name> --alg <key-algorithm> --size <key-size>
```

Here,

- `--name`: Name for RSA key pair.
- `--alg`: Algorithm for the RSA key pair.
- `--size`: Size for the key pair.

Example:

```
./ksctl-linux-amd64 keys create --name rsa-key --alg RSA --size 4096
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",
  "uri": "kylo:kylo:vault:keys:rsa-key-v0",

8fca"
  }

```

In the sample output above, "sourceID":

"b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1" is the private key ID. The "targetID":

"bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395" under "links" is

the public key ID, which is used to download the export file.

Download Export File

As a CipherTrust Manager administrator, download the migration data (the export file) from the CCKM Appliance. This file contains migration data to be uploaded to CCKM Embedded.

Run the command:

```
./ksctl-linux-amd64 migrations download --cckm-host "<cckm-ip-or-hostname>" --cckm-user "<cckm-user>" --cckm-certificate "<certificate-file-content>" --public-key-id "<public-key-id>"
```

Here,

- `--cckm-host`: IP address or hostname of the CCKM Appliance.
- `--cckm-user`: Admin user of the CCKM Appliance.
- `--cckm-certificate`: SSL certificate downloaded from the CCKM Appliance.

By default, the content of the SSL certificate spans over multiple new lines. However, to input the certificate as an inline argument, the certificate content needs to be converted into the single-line format where every new line is represented by `\n`.

To convert the certificate into the single-line format:

- a. Download the certificate in a file (say `certificate.cert`).
- b. Store the certificate file at a location on your machine, for example, at `/root/cert/`.
- c. Run the following command:

```
awk 'NF {sub(/\r/, ""); printf "%s\\n",$0;}' <full-path-to-certificate-file>
```

For example, to convert your certificate file (`/root/cert/certificate.cert`), run the command:

```
awk 'NF {sub(/\r/, ""); printf "%s\\n",$0;}' /root/cert/certificate.cert
```

The above command returns the certificate in the single-line format, as shown below:

```
-----BEGIN CERTIFICATE-----\nMIIDhjCCAm6gAwIBAgIGCBPpf2sUMA0GCSqGSIB3DQEBDAU\nAMC8xIDAeBgNVBAMT\nF0NHIENBIFMgb24gcGt2LWNsdXN0ZXIwMQswCQYDVQQGEwJVUzAeFw0yM
```

```
TAzMMDw\NzI0MDVaFw0zMTAzMDQwNzI0MDVaMCQxFTATBgNVBAMTDHBrdi1jbHVzdGVyMTEl\nM

es0v8/XeGvzkuy55dT07SwhLGTKiuv5L2ADawGQmLNQ7thNUN2P\n-----END CERTIFICAT
E-----\n
```

d. Copy the returned single-line certificate content. You need to paste this content as the value for `--cckm-certificate`.

- `--public-key-id`: ID of the local (public) key of the RSA key pair generated in [Generate RSA Key Pair](#).

The command prompts for the password. Enter the password of the CCKM Appliance user (`cckm-user`).

Example:

```
./ksctl-linux-amd64 migrations download --cckm-host "127.0.0.1" --cckm-user "admin" --cckm-certificate "-----BEGIN CERTIFICATE-----\nMIIDhjCCAm6gAwIBAgIGCBPpf2sU

Kiuv5L2ADawGQmLNQ7thNUN2P\n-----END CERTIFICATE-----\n" --public-key-id "bd3e3bf
a246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395"
```

Output:

```
CCKM enterprise user password:
File is downloading.
File downloaded successfully: migration_20210621143427.json
```

An export file named `"migration_<TIMESTAMP>.json"` (for example, `migration_20210621143427.json`) is created and downloaded to your machine.

Note

After downloading the migration data (the export file), open the file and check whether it contains a

"containers" tag at the beginning of the file.

Upload Export File

As a CipherTrust Manager administrator, upload the downloaded export file to CCKM Embedded.

Run the command:

```
./ksctl-linux-amd64 migrations upload --file <export-file-name>
```

Here,

- `--file`: Name of the export file.

Example:

```
./ksctl-linux-amd64 migrations upload --file migration_20210621143427.json
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",
  "checksum_sha256": "3e853d19e1d4a3687dfcf7bde5fc6bb192c19345462c5f4ae05c481acf26968b",
  "product": "CCKM"
}
```

Note down the "id" value, "26304f13-5626-419b-bd81-459fda7fdb68". It is required when applying the migration data. Now, you need to apply the migration data to CCKM Embedded (refer to [Migrate Complete Data](#)).

Apply Migration Data

The migration data can be applied to CCKM Embedded in two ways:

- [Migrate Data of Set of Containers](#)
- [Migrate Complete Data](#)

Note

In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.

Migrate Data of Set of Containers

This method requires a list of containers. After the exported file is uploaded to the CipherTrust Manager, you can get the list of containers and select the containers to be migrated.

To migrate the data of a set of containers:

1. List the migrated containers.

Run the command:

```
./ksctl-linux-amd64 migrations containers list -id <export-file-id>
```

Here,

- **-id**: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.

Example:

```
./ksctl-linux-amd64 migrations containers list --id 26304f13-5626-419b-bd81-459fda7fdb68
```

Output:

```
{
  "Containers": [
    {
      "id": "b10ba3f2-b835-485d-b09a-07d4c002ff97",
      "type": "aws",
      "name": "805182230944",
      "tenant": "805182230944"
    },
    {
      "id": "0de664f3-7c70-4fae-9213-4e16bb99a4fc",
      "type": "aws",
      "name": "556782317223",

```

```

        "tenant": "556782317223"
    },
    {
        "id": "3f2b09ba-485d-b835-b09a-07d4c002ff97",
        "type": "salesforce",
        "name": "0056A0000011XDvQAM",
        "tenant": "0056A0000011XDvQAM"
    },
    {
        "id": "4f4b11ba-c385-456d-b09a-07d4c002ff97",
        "type": "salesforcesandbox",
        "name": "0056A0000011ABvZCM",
        "tenant": "0056A0000011ABvZCM"
    },
    {
        "id": "0941754d-9cb9-4b32-a241-59f7a4703756",
        "type": "azure",
        "name": "pkv-premium",
        "tenant": "d27d849e-e487-4b0e-a54c-a71e67687d10"
    }
}

```

This command returns the list of containers with their IDs. From this list, you can select the containers to be migrated.

2. Select the desired containers to be migrated. In this example, we will migrate the containers with the IDs `"b10ba3f2-b835-485d-b09a-07d4c002ff97"` and `"0941754d-9cb9-4b32-a241-59f7a4703756"`.
3. Apply the migration to migrate the desired container.

Run the command:

```

./ksctl-linux-amd64 migrations apply --id <export-file-id> --private-key-id <private-key-id> --containers "<container1-id>,<container2-id>,...,<containerN-id>"

```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.
- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.

- `--containers`: Comma-separated container IDs.

Example:

```
./ksctl-linux-amd64 migrations apply --id 26304f13-5626-419b-bd81-459fda7fdb68
--private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c3
3c1 --containers "b10ba3f2-b835-485d-b09a-07d4c002ff97,0941754d-9cb9-4b32-a24
1-59f7a4703756",
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460a
a9cd65383e",
  "product": "CCKM"
}
```

The container migration data is applied. It might take some time to complete. Verify the migration status. Refer to [Check Migration Status](#) for details.

Migrate Complete Data

To migrate the complete data, run the command:

```
./ksctl-linux-amd64 migrations apply --id <export-file-id> --private-key-id <priv
ate-key-id>
```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.
- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.

Example:

```
./ksctl-linux-amd64 migrations apply --id 26304f13-5626-419b-bd81-459fda7fdb68 --
private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460aa9c
d65383e",
  "product": "CCKM"
}
```

Check Migration Status

After you have applied the migration data, verify the migration status by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "9c9149ad-901b-405f-aefd-b279e6257f97",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfmc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 }
}
```

In the sample output above, `"overall_status": "Completed"` indicates that migration of CCKM Appliance to CCKM Embedded is successful. Also, verify that migration status of different clouds and key sources such as `"cckm_azure_keys"`, `"cckm_aws_keys"`, and `"cckm_dsm_keys"` is `"Completed"`.

In the output, **"num_ignored"** indicates the number of Azure keys for which blobs are present on the DSM but the keys have been deleted.

After the migration status is **"Completed"**, you can add connection to supported clouds and key sources to perform operations on the added data.

Add DSM Cluster Nodes

If your DSM was in a cluster before migration, then after migration, the DSM connection information will contain only the IP address or hostname with which your CCKM Appliance was configured.

To add other DSM cluster nodes, update the migrated DSM connection on the CipherTrust Manager. Refer to [Adding Node in an Existing DSM Connection](#) for details.

Add Connection

Add connection to the desired clouds on the CipherTrust Manager. Refer to [Connection Manager](#) for details on connection management.

Update Containers

After the connection is created, update connection in AWS KMS, Azure key vaults, Salesforce organizations, and Google key rings on the Containers tab. After the update, keys in supported clouds and key sources can be managed from CCKM Embedded.

For **Salesforce**, you also need to synchronize certificates and update endpoints linked with the organizations.

- **Synchronize certificates:** After migration, the certificates linked with the cache-only keys and schedulers are not synchronized. You need to manually synchronize them on CCKM. Refer to [Prepare the Cache-Only Key Integration](#) for details.
- **Update endpoints:** The endpoint URLs used in Named Credentials for cache-only keys before migration will not work after migration. This is because the Callout URL check performed by Salesforce while fetching the cache-only keys will fail. So, you need to update the endpoint URLs in Named Credential on Salesforce and create the same endpoints on CCKM.

Alternatively, you can create new endpoint URLs on Salesforce and CCKM and use them.

Refer to [Prepare the Cache-Only Key Integration](#) and [Edit a Salesforce Cache-Only Key Endpoint](#) for details.

Note

DSM is EOL as of June 2024 and its support as a key source is being deprecated. Therefore, after migrating the cloud keys, it's recommended to migrate the DSM source keys to CipherTrust Manager. Follow the instructions provided in [Migrate DSM Source Keys](#).

4. Migrate cloud keys when CipherTrust Manager is used as key source with CCKM Appliance

This section describes steps to migrate both cloud keys and the CipherTrust Manager source keys from CCKM Appliance to the CipherTrust Manager. Before proceeding, read the [prerequisites](#).

Note

- The user who performs the migration becomes the owner of the migrated keys.
- Migration of the CipherTrust Manager source keys from CCKM Appliance should be done on the same CipherTrust Manager with which the CCKM Appliance is configured.

The steps below apply to root domain only. To perform migration on a child domain, refer to [Migration from CCKM Appliance to Child Domain](#).

Generate RSA Key Pair

Exporting migration data from CCKM Appliance requires an RSA key pair (public and private) on the CipherTrust Manager. The public key is used to encrypt the data while the private key is used to decrypt the exported data.

To generate an RSA key pair, run the `ksctl keys create` command:

```
./ksctl-linux-amd64 keys create --name <rsa-key-name> --alg <key-algorithm> --size <key-size>
```

Here,

- `--name`: Name for RSA key pair.
- `--alg`: Algorithm for the RSA key pair.
- `--size`: Size for the key pair.

Example:

```
./ksctl-linux-amd64 keys create --name rsa-key --alg RSA --size 4096
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",

  }

```

In the sample output above, "sourceID":

"b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1" is the private key ID. The "targetID":

"bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395" under "links" is the public key ID, which is used to download the export file.

Download Export File

As a CipherTrust Manager administrator, download the migration data (the export file) from the CCKM Appliance. This file contains migration data to be uploaded to CCKM Embedded.

Run the command:

```

./ksctl-linux-amd64 migrations download --cckm-host "<cckm-ip-or-hostname>" --cckm-user "<cckm-user>" --cckm-certificate "<certificate-file-content>" --public-key-id "<public-key-id>"

```

Here,

- **--cckm-host**: IP address or hostname of the CCKM Appliance.
- **--cckm-user**: Admin user of the CCKM Appliance.
- **--cckm-certificate**: SSL certificate downloaded from the CCKM Appliance.

By default, the content of the SSL certificate spans over multiple new lines. However, to input the certificate as an inline argument, the certificate content needs to be converted into the single-line format where every new line is represented by `\n`.

To convert the certificate into the single-line format:

- a. Download the certificate in a file (say `certificate.cert`).
- b. Store the certificate file at a location on your machine, for example, at `/root/cert/`.
- c. Run the following command:

```

awk 'NF {sub(/\r/, ""); printf "%s\\n",$0;}' <full-path-to-certificate-file>

```

For example, to convert your certificate file (`/root/cert/certificate.cert`), run the command:

```
awk 'NF {sub(/\r/, ""); printf "%s\n",$0;}' /root/cert/certificate.cert
```

The above command returns the certificate in the single-line format, as shown below:

```
-----BEGIN CERTIFICATE-----\nMIIDhjCCAm6gAwIBAgIGCBPpf2sUMA0GCSqGSIB3DQEBDAU
AMC8xIDAeBgNVBAMT\F0NHIENBIFMgb24gcGt2LWnsdXN0ZXIwMQswCQYDVQQGEwJVUzAeFw0yM

es0v8/XeGvzkuy55dT07SwhLGTkiuv5L2ADawGQmLnQ7thNUN2P\n-----END CERTIFICAT
E-----\n
```

- d. Copy the returned single-line certificate content. You need to paste this content as the value for `--cckm-certificate`.

- `--public-key-id`: ID of the local (public) key of the RSA key pair generated in [Generate RSA Key Pair](#).

The command prompts for the password. Enter the password of the CCKM Appliance user (`cckm-user`).

Example:

```
./ksctl-linux-amd64 migrations download --cckm-host "127.0.0.1" --cckm-user "admin" --cckm-certificate "-----BEGIN CERTIFICATE-----\nMIIDhjCCAm6gAwIBAgIGCBPpf2sUMA0GCSqGSIB3DQEBDAUAMC8xIDAeBgNVBAMT\F0NHIENBIFMgb24gcGt2LWnsdXN0ZXIwMQswCQYDVQQGEwJVUzAeFw0yMTAzMMDMw\nNzI0MDVaFw0zMTAzMDQwNzI0MDVaMCQxFTATBgNVBAMTDHBrdi1jbHVzdGVyMTTEL\nMAkGA1UEBhMCMVVMwggEiMA0GCSqGSIB3DQEBAQUAA4IBDwAwggEKAoIBAQD0h14c\nhxamUh7e0/TzdS016djkaL8x1a/uljy8RediBA2W5Yrmm4sTBx0/PFZ0l+0wyzYe\n7VqsCG3P5+lsTiXw2VLXKT7qyiil7P8ParCoKt6v5fp6BjtDZzq7q3uG8daZqL4M\nKrAiI8rcGPDgsAex/kSPAB4di1AFjDDNv7SCiet5kWJq8YeTZEuwYa8rxLi2QEqJ\n4h/mHDqD35jNiSf4FRksWfUwtsY652XIIfBvPdnwkp sA/+kEN04Aiuve9CSvyIBmR\nKaqBwnmYdQZaBJGFKEvjnArtSMMwCULlxikQCiUk1BaW9H7f/WQUuNh7xManRb7w\ndNkhqAhSPyqgjz/TAgMBAAGjgbIwga8wFgYDVR0LAQH/BAwwCgYIKwYBBQUHAwEw\ndAYDVR0TAQH/BAIwADA0BgNVHQ8BAf8EBAMCA6gwHQYDVR00BBYEFFnFr/+FuXPw\n02+F2es0v8/XeGvzkuy55dT07SwhLGTkiuv5L2ADawGQmLnQ7thNUN2P\n-----END CERTIFICATE-----\n" --public-key-id "bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395"
```

Output:

```
CCKM enterprise user password:
File is downloading.
File downloaded successfully: migration_20210621143427.json
```

An export file named "migration_<TIMESTAMP>.json" (for example, migration_20210621143427.json) is created and downloaded to your machine.

Note

After downloading the migration data (the export file), open the file and check whether it contains a "containers" tag at the beginning of the file.

Upload Export File

As a CipherTrust Manager administrator, upload the downloaded export file to CCKM Embedded.

Run the command:

```
./ksctl-linux-amd64 migrations upload --file <export-file-name>
```

Here,

- `--file`: Name of the export file.

Example:

```
./ksctl-linux-amd64 migrations upload --file migration_20210621143427.json
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",
  "checksum_sha256": "3e853d19e1d4a3687dfcf7bde5fc6bb192c19345462c5f4ae05c481acf26968b",
  "product": "CCKM"
}
```

Note down the "id" value, "26304f13-5626-419b-bd81-459fda7fdb68". It is required when applying the migration data. Now, you need to apply the migration data to CCKM Embedded (refer to [Migrate Complete Data](#)).

Apply Migration Data

The migration data can be applied to CCKM Embedded in two ways:

- [Migrate Data of Set of Containers](#)
- [Migrate Complete Data](#)

Note

- In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.
- After migration, all the source keys will be migrated to the current domain on the CipherTrust Manager (where the migration is being performed).
- Even if you migrate specific KMS containers, all of the CipherTrust Manager source keys will be migrated.

Migrate Data of Set of Containers

This method requires a list of containers. After the exported file is uploaded to the CipherTrust Manager, you can get the list of containers and select the containers to be migrated.

To migrate the data of a set of containers:

1. List the migrated containers.

Run the command:

```
./ksctl-linux-amd64 migrations containers list -id <export-file-id>
```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.

Example:

```
./ksctl-linux-amd64 migrations containers list --id 26304f13-5626-419b-bd81-459fda7fdb68
```

Output:

```
{
  "Containers": [
    {
      "id": "b10ba3f2-b835-485d-b09a-07d4c002ff97",
      "type": "aws",
      "name": "805182230944",
```

```

        "tenant": "805182230944"
    },
    {
        "id": "0de664f3-7c70-4fae-9213-4e16bb99a4fc",
        "type": "aws",
        "name": "556782317223",
        "tenant": "556782317223"
    },
    {
        "id": "3f2b09ba-485d-b835-b09a-07d4c002ff97",
        "type": "salesforce",
        "name": "0056A0000011XDvQAM",
        "tenant": "0056A0000011XDvQAM"
    },
    {
        "id": "4f4b11ba-c385-456d-b09a-07d4c002ff97",
        "type": "salesforcesandbox",
        "name": "0056A0000011ABvZCM",
        "tenant": "0056A0000011ABvZCM"
    },
    {
        "id": "0941754d-9cb9-4b32-a241-59f7a4703756",
        "type": "azure",
        "name": "pkv-premium",
        "tenant": "d27d849e-e487-4b0e-a54c-a71e67687d10"
    }
}

```

This command returns the list of containers with their IDs. From this list, you can select the containers to be migrated.

2. Select the desired containers to be migrated. In this example, we will migrate the containers with the IDs `"b10ba3f2-b835-485d-b09a-07d4c002ff97"` and `"0941754d-9cb9-4b32-a241-59f7a4703756"`.
3. Apply the migration to migrate the desired container.

Run the command:

```

./ksctl-linux-amd64 migrations apply --id <export-file-id> --private-key-id <private-key-id> --migrate-cckm-source-keys --containers "<container1-id>,<container2-id>,...,<containerN-id>"

```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.
- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.
- `--migrate-cckm-source-keys`: Tag to migrate the source keys.
- `--containers`: Comma-separated container IDs.

Example:

```
./ksctl-linux-amd64 migrations apply --id 26304f13-5626-419b-bd81-459fda7fdb68
--private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c3
3c1 --migrate-cckm-source-keys --containers "b10ba3f2-b835-485d-b09a-07d4c002f
f97,0941754d-9cb9-4b32-a241-59f7a4703756",
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460a
a9cd65383e",
  "product": "CCKM"
}
```

The container migration data is applied. It might take some time to complete. Verify the migration status. Refer to [Check Migration Status](#) for details.

Migrate Complete Data

To migrate the complete data, run the command:

```
./ksctl-linux-amd64 migrations apply --id <export-file-id> --private-key-id <priv
ate-key-id> --migrate-cckm-source-keys
```

Here,

- `--id`: ID of the uploaded export file. Refer to [Upload Export File](#) for the ID of the export file.
- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.

- `--migrate-cckm-source-keys`: Tag to migrate the source keys.

Example:

```
./ksctl-linux-amd64 migrations apply --id 26304f13-5626-419b-bd81-459fda7fdb68 --
private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1
--migrate-cckm-source-keys
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 22940401,
  "created_at": "2021-05-06T14:19:54.76812635Z",
  "status": "In progress",
  "checksum_sha256": "3386289c00e7e8bf7ad70a5ca12d0852913c0fb3a54f584c28460aa9c
d65383e",
  "product": "CCKM"
}
```

Check Migration Status

After you have applied the migration data, verify the migration status by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "9c9149ad-901b-405f-aefd-b279e6257f97",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfmc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
```

```

    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 }
  }

```

In the sample output above, `"overall_status": "Completed"` indicates that migration of CCKM Appliance to CCKM Embedded is successful. Also, verify that migration status of different clouds and key sources such as `"cckm_azure_keys"`, `"cckm_aws_keys"`, and `"cckm_dsm_keys"` is `"Completed"`.

In the output, `"num_ignored"` indicates the number of Azure keys for which blobs are present on the CipherTrust Manager but the keys have been deleted.

After the migration status is `"Completed"`, you can add connection to supported clouds and key sources to perform operations on the added data.

After migration, you can see the migrated keys on the Keys page of the CipherTrust Manager GUI.

Add Connection

Add connection to the desired clouds on the CipherTrust Manager. Refer to [Connection Manager](#) for details on connection management.

Update Containers

After the connection is created, update connection in AWS KMS, Azure key vaults, Salesforce organizations, and Google key rings on the Containers tab. After the update, keys in supported clouds and key sources can be managed from CCKM Embedded.

For **Salesforce**, you also need to synchronize certificates and update endpoints linked with the organizations.

- **Synchronize certificates:** After migration, the certificates linked with the cache-only keys and schedulers are not synchronized. You need to manually synchronize them on CCKM. Refer to [Prepare the Cache-Only Key Integration](#) for details.
- **Update endpoints:** The endpoint URLs used in Named Credentials for cache-only keys before migration will not work after migration. This is because the Callout URL check performed by Salesforce while fetching the cache-only keys will fail. So, you need to update the endpoint URLs in Named Credential on Salesforce and create the same endpoints on CCKM.

Alternatively, you can create new endpoint URLs on Salesforce and CCKM and use them.

Refer to [Prepare the Cache-Only Key Integration](#) and [Edit a Salesforce Cache-Only Key Endpoint](#) for details.

5. Cloud keys already migrated, but kept DSM as key source, now migrate DSM keys to a local CM

This section provides instructions to migrate the DSM source keys from CCKM Appliance to the CipherTrust Manager. This section assumes that you have already migrated only the cloud keys to the CipherTrust Manager.

Note

The user who performs the migration becomes the owner of the migrated keys.

The steps above apply to the root domain only. To perform migration on a child domain, refer to [Migration from CCKM Appliance to Child Domain](#).

Generate RSA Key Pair

Creating migration data from CCKM Appliance requires an RSA key pair (public and private) on the CipherTrust Manager. The public key is used to encrypt the data while the private key is used to decrypt the migrated data.

To generate an RSA key pair, run the `ksctl keys create` command:

```
./ksctl-linux-amd64 keys create --name <rsa-key-name> --alg <key-algorithm> --size <key-size>
```

Here,

- `--name`: Name for RSA key pair.
- `--alg`: Algorithm for the RSA key pair.
- `--size`: Size for the key pair.

Example:

```
./ksctl-linux-amd64 keys create --name rsa-key --alg RSA --size 4096
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",
  "uri": "kylo:kylo:vault:keys:rsa-key-v0",
  "account": "kylo:kylo:admin:accounts:kylo",
  "application": "ncryptify:gemalto:admin:apps:kylo",
  "devAccount": "ncryptify:gemalto:admin:accounts:gemalto",
  "createdAt": "2021-05-07T03:55:47.519466Z",
  "name": "rsa-key",
  "updatedAt": "2021-05-07T03:55:47.519466Z",
  "usage": "sign",
  "usageMask": 3,
  "meta": {
    "ownerId": "local|5e3b45c6-6f26-4413-9752-e6fd15418a61"
  },
  "version": 0,
  "algorithm": "RSA",
  "size": 4096,
```

```

8fca"
  }

```

In the sample output above, "sourceID":

"b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1" is the private key ID. The "targetID":

"bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395" under "links" is

the public key ID.

Create Migration Data

Create the migration data for the DSM key source. Specify `--key-source` as `dsm`.

Run the command:

```
./ksctl-linux-amd64 migrations create --key-source dsm --public-key-id <public-key-id>
```

Here,

- `--key-source`: Specify `dsm` as the key source.

Example:

```
./ksctl-linux-amd64 migrations create --key-source dsm --public-key-id c9b6922153e74c1f9be4bf9344ebf8eed827aa281be947a2b249b57f9f0c5d1c
```

Output:

```
{
  "status": "In progress"
}
```

Get the uploadID

After you have initiated the creation of migration data for the DSM key source, get the `uploadID` by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "9c9149ad-901b-405f-aefd-b279e6257f97",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfdc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
}
```

```

    "cckm_aws_keys": {
      "status": "Completed",
      "num_processed": 100,
      "num_failed": 0,
      "num_ignored": 0 },
    "cckm_dsm_keys": {
      "status": "Completed",
      "num_processed": 100,
      "num_failed": 0,
      "num_ignored": 0 },
    "cckm_gcp_keys": {
      "status": "",
      "num_processed": 0,
      "num_failed": 0,
      "num_ignored": 0},
    "cckm_generate_migration": {
      "status": "Completed",
      "uploadID": "f915a761-9fa8-449d-a969-122601ef244e"
    }
  }
}

```

Note down the "uploadID" value, "f915a761-9fa8-449d-a969-122601ef244e". It is required when applying the migration data. Now, you need to apply the migration data to CCKM Embedded (refer to [Apply Migration Data](#)).

Apply Migration Data

Note

- In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.
- After migration, all the source keys from DSM will be migrated to the current domain on the CipherTrust Manager (where the migration is being performed).
- Even if you migrate specific KMS containers, all of the DSM source keys will be migrated.
- After all the source keys are moved to the CipherTrust Manager, you can remove DSM from CCKM Embedded, if needed. Refer to [Deleting DSM Domains](#) and [Deleting a DSM Connection](#).

To apply the migration data, run the command:

```
./ksctl-linux-amd64 migrations apply --id <uploadID> --private-key-id <private-key-id>
```

Here,

- `--id`: uploadID returned in [Check Status of uploadID](#).

- `--private-key-id`: ID of the private key of the RSA key pair. Refer to [Generate RSA Key Pair](#) for the private key ID.

Example:

```
./ksctl-linux-amd64 migrations apply --id f915a761-9fa8-449d-a969-122601ef244e --private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1
```

Output:

```
{
  "id": "f915a761-9fa8-449d-a969-122601ef244e",
  "file_size": 70697,
  "created_at": "2022-11-28T04:24:28.004216933Z",
  "status": "In progress",
  "checksum_sha256": "8b5839e47dfbb68b9dadbd1f31e416321a5033db2b7956ddc03e07748e58258a8",
  "product": "CCKM"
}
```

Check Migration Status

After you have applied the migration data, verify the migration status by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "f915a761-9fa8-449d-a969-122601ef244e",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfdc_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
```

```

    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
    "cckm_generate_migration": {
    "status": "Completed",
    "uploadID": "f915a761-9fa8-449d-a969-122601ef244e"}
  }

```

In the sample output above, `"overall_status": "Completed"` indicates that migration of DSM source keys from CCKM Appliance to CCKM Embedded is successful.

6. Cloud keys already migrated, but kept DSM as the key source, now migrate DSM keys to an external CipherTrust Manager

Before migration, ensure that both the local and external CipherTrust Managers are running the identical build of the same CipherTrust Manager version (2.20 or later).

Migrate the DSM source keys from CipherTrust Manager to external CipherTrust Manager

Tip

Perform this step multiple times - once for each external CipherTrust Manager domain. This ensures that all DSM source keys are properly migrated from all DSM domains to their respective CipherTrust Manager domains.

This section provides instructions to migrate the DSM source keys from CipherTrust Manager to external CipherTrust Manager. This section assumes that you have already migrated the cloud keys to the CipherTrust Manager.

Note

The user who performs the migration becomes the owner of the migrated keys.

The steps below apply to the root domain only. To perform migration on a child domain, refer to [Migration from CCKM Appliance to Child Domain](#).

1. Generate RSA Key Pair

Creating migration data from local CipherTrust Manager requires an RSA key pair (public and private) on the external CipherTrust Manager. The public key is used to encrypt the data while the private key is used to decrypt the migrated data.

To generate an RSA key pair, run the `ksctl keys create` command on external CipherTrust Manager:

```
./ksctl-linux-amd64 keys create --name <rsa-key-name> --alg <key-algorithm> --size <key-size>
```

Here,

- **--name**: Name for RSA key pair.
- **--alg**: Algorithm for the RSA key pair.
- **--size**: Size for the key pair.

Example:

```
./ksctl-linux-amd64 keys create --name rsa-key --alg RSA --size 4096
```

Output:

```
{
  "id": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1",

      "sourceID": "b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd
202bd4c33c1",
      "target": "kylo:kylo:vault:keys:rsa-key-pub-v0",
      "targetID": "bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c213
8569d99e395",
      "index": 0
    }
  ],
  "uuid": "4b9e7c53-40d7-44b7-9fa1-31cf8d0237d3",
  "muid": "4b9e7c53-40d7-44b7-9fa1-31cf8d0237d3e129ed33-317d-4584-9cbf-d0e88

```

```
2f58fca"
}
```

In the sample output above, "sourceID":

"b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1" is the private key ID. The "targetID":

"bd3e3bfa246f470ea6327646b3db359fcb882a6e2a6d4f839c2138569d99e395" under "links" is the public key ID. The "publickey" is the public key material.

2. Download Migration Data

Download the migration data to migrate DSM keys to an external CipherTrust Manager.

Run the command on local CipherTrust Manager:

```
./ksctl-linux-amd64 migrations download --public-key-material "<public-key-material>" --download-dsm-externalcm-mig-data
```

Here,

- **--public-key-material**: public-key-material is the public key generated from the external CipherTrust Manager to encrypt the migration data.
- **--download-dsm-externalcm-mig-data**: With this flag, the migration data will be downloaded to the migration of source keys from DSM to external CipherTrust Manager when the cloud keys from CCKM Enterprise are already migrated to CipherTrust Manager

Example:

```
./ksctl-linux-amd64 migrations download --public-key-material "-----BEGIN PUBLIC KEY-----MIIEvgIBADANBgkqhkiG9w0BAQEFAASCBAgEAAoIBAQDXrrAQ01aKDRY9-----END PUBLIC KEY-----" --download-dsm-externalcm-mig-data
```

Output:

```
{
  File is downloading...
  File downloaded successfully: migration_20250508143834.json
}
```

3. Upload Migration Data to the External CipherTrust Manager

As a CipherTrust Manager administrator, upload the downloaded export file to the external CipherTrust Manager.

Run the command on external CipherTrust Manager:

```
./ksctl-linux-amd64 migrations upload --file <export-file-name>
```

Here,

- **--file**: Name of the export file.

Example:

```
./ksctl-linux-amd64 migrations upload --file migration_20210621143427.json
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",
  "checksum_sha256": "3e853d19e1d4a3687dfcf7bde5fc6bb192c19345462c5f4ae05c481
acf26968b",
  "product": "CCKM"
}
```

Note down the **"id"** value, **"26304f13-5626-419b-bd81-459fda7fdb68"**. It is required when applying the migration data. Now, you need to apply the migration data to external CipherTrust Manager (refer to [Migrate Complete Data](#)).

4. Apply Migration Data

The migration data can be applied to external CipherTrust Manager by [migrating data of set of containers](#).

Note

- In a clustered CipherTrust Manager environment, apply the migration data on one node only. Migrated data is automatically replicated to other nodes of the cluster.
- After migration, all the source keys from DSM will be migrated to the current domain on the external CipherTrust Manager (where the migration is being performed).
- After all the source keys are moved to the external CipherTrust Manager, you can remove DSM from

CCKM Embedded, if needed. Refer to [Deleting DSM Domains](#) and [Deleting a DSM Connection](#).

To apply the migration data, run the command on external CipherTrust Manager:

```
./ksctl-linux-amd64 migrations apply --id <uploadID> --private-key-id <private-key-id> --migrate-dsmkeys-to-externalcm-from-cm
```

Here,

- **--id**: uploadID returned in [Check Status of uploadID](#).
- **--private-key-id**: ID of the private key of the RSA key pair.

The public key material of the RSA key pair is used to download the migration data.

- **--migrate-dsmkeys-to-externalcm-from-cm**: This optional parameter is used only while migrating source keys from DSM to external CipherTrust Manager when the cloud keys from CCKM Enterprise are already migrated to CipherTrust Manager. With this flag, the source keys will be migrated from DSM to external CipherTrust Manager.

Example:

```
./ksctl-linux-amd64 migrations apply --id f915a761-9fa8-449d-a969-122601ef244e --private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c33c1 --migrate-dsmkeys-to-externalcm-from-cm
```

Output:

```
{
  "id": "f915a761-9fa8-449d-a969-122601ef244e",
  "file_size": 70697,
  "created_at": "2022-11-28T04:24:28.004216933Z",
  "status": "In progress",
  "checksum_sha256": "8b5839e47dfbb68b9dadb1f31e416321a5033db2b7956ddc03e07748e58258a8",
  "product": "CCKM"
}
```

5. Check Migration Status

After you have applied the migration data, verify the migration status by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "f915a761-9fa8-449d-a969-122601ef244e",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "not started",
    "num_processed": 0,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_sfmc_keys": {
    "status": "not started",
    "num_processed": 0,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_aws_keys": {
    "status": "not started",
    "num_processed": 0,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_dsm_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
  "cckm_generate_migration": {
    "status": "not started"}
}
```

In the sample output above, `"overall_status": "Completed"` indicates that the migration of DSM source keys from local CipherTrust Manager to external CipherTrust Manager is successful.

Migrate to Update the Source Key Linkings in Cloud Keys

1. Prerequisites for Migration

- Source keys from DSM are migrated to the external CipherTrust Manager.
- After migrating the DSM source keys to the external CipherTrust Manager, assign the **Key Admins** permission to the client CipherTrust Manager. Refer to [Refer to Add the Client](#) for details.

2. Migration Steps

On the CipherTrust Manager, configure the *external* CipherTrust Manager as a key source.

- Add the external CipherTrust Manager connection. Refer to [CM Connection/External CM](#).
- Add the *external* CipherTrust Manager domains where the DSM source keys were migrated.
- Refresh the CipherTrust domains added to the CipherTrust Manager.

3. Download Migration Data

Download the migration data from CipherTrust Manager to update the source key linkings.

Run the command on local CipherTrust Manager:

```
./ksctl-linux-amd64 migrations download --public-key-material "<public-key-material>" --download-dsm-externalcm-mig-data
```

Here,

- **--public-key-material**: Public key generated from local CipherTrust Manager to encrypt migration data.
- **--download-dsm-externalcm-mig-data**: With this flag, the migration data will be downloaded to the migration of source keys from DSM to external CipherTrust Manager when the cloud keys from CCKM Enterprise are already migrated to CipherTrust Manager.

Example:

```
./ksctl-linux-amd64 migrations download --public-key-material "-----BEGIN PUBLIC KEY-----MIIEvGIBADANBgkqhkiG9w0BAQEFAASCBAgEAAoIBAQDXrrAQ01aKDRY9-----END PUBLIC KEY-----" --download-dsm-externalcm-mig-data
```

Output:

```
{
  File is downloading...
  File downloaded successfully: migration_20250508160025.json
}
```

4. Upload Migration Data to the Local CipherTrust Manager

As a CipherTrust Manager administrator, upload the downloaded export file to the local CipherTrust Manager.

Run the command on local CipherTrust Manager:

```
./ksctl-linux-amd64 migrations upload --file <export-file-name>
```

Here,

- **--file**: Name of the export file.

Example:

```
./ksctl-linux-amd64 migrations upload --file migration_20210621143427.json
```

Output:

```
{
  "id": "26304f13-5626-419b-bd81-459fda7fdb68",
  "file_size": 21712358,
  "created_at": "2021-05-07T04:55:33.251439962Z",
  "checksum_sha256": "3e853d19e1d4a3687dfcf7bde5fc6bb192c19345462c5f4ae05c481acf26968b",
  "product": "CCKM"
}
```

Note down the **"id"** value, **"26304f13-5626-419b-bd81-459fda7fdb68"**. It is required when applying the migration data. Now, you need to apply the migration data to the local CipherTrust Manager (refer to [Migrate Complete Data](#)).

5. Apply Migration Data

To apply the migration data, run the command on local CipherTrust Manager:

```
./ksctl-linux-amd64 migrations apply --id <uploadID> --private-key-id <private-key-id> --update-cloudkeys-with-externalcm-keys
```

Here,

- **--id**: uploadID returned in [Check Status of uploadID](#).
- **--private-key-id**: ID of the private key of the RSA key pair.

The public key material of the RSA key pair is used to download the migration data.

- `--update-cloudkeys-with-externalcm-keys`: This optional parameter is used only while migrating source keys from DSM to external CipherTrust Manager when the cloud keys from CCKM Enterprise are already migrated to CipherTrust Manager. If this flag is set to true, the cloud keys will be updated with the corresponding migrated external CipherTrust Manager keys.

Example:

```
./ksctl-linux-amd64 migrations apply --id f915a761-9fa8-449d-a969-122601ef244e
--private-key-id b4336425a98541b68a105326be8abd777ac994f789ac46c2a79dd202bd4c3
3c1 --update-cloudkeys-with-externalcm-keys
```

Output:

```
{
  "id": "f915a761-9fa8-449d-a969-122601ef244e",
  "file_size": 70697,
  "created_at": "2022-11-28T04:24:28.004216933Z",
  "status": "In progress",
  "checksum_sha256": "8b5839e47dfbb68b9dadb1f31e416321a5033db2b7956ddc03e077
48e58258a8",
  "product": "CCKM"
}
```

6. Check Migration Status

After you have applied the migration data, verify the migration status by running the `ksctl migrations status` command.

Example:

```
./ksctl-linux-amd64 migrations status
```

Output:

```
{
  "id": "f915a761-9fa8-449d-a969-122601ef244e",
  "overall_status": "Completed",
  "source": "CCKM",
  "cckm_azure_keys": {
    "status": "not started",
```

```

    "num_processed": 0,
    "num_failed": 0,
    "num_ignored": 0 },
    "cckm_sfkc_keys": {
    "status": "not started",
    "num_processed": 0,
    "num_failed": 0,
    "num_ignored": 0 },
    "cckm_aws_keys": {
    "status": "not started",
    "num_processed": 0,
    "num_failed": 0,
    "num_ignored": 0 },
    "cckm_dsm_keys": {
    "status": "Completed",
    "num_processed": 100,
    "num_failed": 0,
    "num_ignored": 0 },
    "cckm_generate_migration": {
    "status": "Completed"}
}

```

In the sample output above, `"overall_status": "Completed"` indicates that migration of DSM source keys linking to external CipherTrust Manager is successful.

Note

If the migration data contains Salesforce schedules, then after migration, update the external CipherTrust Manager domain and Certificate in the Salesforce schedules.

Migration from CCKM Appliance to Child Domain

To migrate the CCKM Appliance data to CCKM Embedded in a child domain.

1. Set `export KSCTL_DOMAIN=<child-domain>` on the machine where you will run the ksctl commands.
2. Perform the migration steps, as described in sections above.

Note

The steps above show examples of `ksctl` commands. Switch to the child domain `<child-domain>` to:

- Check the migration status using the API.
- Verify or access the migrated data on the CipherTrust Manager GUI.

Backup and Restore

CCKM resources can be backed up and restored on the CipherTrust Manager. CipherTrust Manager supports system backups and domain scoped backups. Refer to [Backups](#) for details.

Only the CCKM EKM resources are part of the domain backup. Support for other CCKM resources will be added in a future release. This section describes the behavior of CCKM resources while restoring domain backups.

Note

- The backup and restore of CCKM resources (Projects, Google EKM Endpoints and Cryptospaces) in a domain only works among the domains of different CipherTrust Managers. This feature does not support backup and restore among different domains of the same CipherTrust Manager.
- Currently, partial domain backup and restore of CCKM resources (Projects, Cryptospaces, EKM Endpoint) are *not* supported.

Restore Behavior of CCKM Resources

Note

It is recommended to restore the backup of CCKM resources in an empty domain.

After restore, make sure to update the **Key URI Hostname** of the restored EKM endpoints.

The following table depicts the behavior of CCKM resources. We recommend you to get familiar with the below terms used in the table:

Resource is skipped: the resource will be ignored and not restored.

Conflicting resource: at least any one of the unique attributes (for example, name) of the resource is the same in the source domain (backup file) and the target domain.

Conflicting Resource	Behavior
Project	1. This project will be skipped. 2. All cryptospaces created under this project will be skipped.

Conflicting Resource	Behavior
	3. All EKM endpoints created under each cryptospace in step 2 will be skipped.
Cryptospace	1. This cryptospace will be skipped. 2. All EKM endpoints created under this cryptospace will be skipped.
EKM Endpoint	1. This EKM Endpoint will be skipped.

Product Brief

CipherTrust Cloud Key Management

Cloud Encryption Key
Lifecycle Management

cpl.thalesgroup.com

THALES
Building a future we can all trust

Industry best practices as defined by the Cloud Security Alliance (CSA) require that keys be stored and managed outside of the cloud service provider and the associated encryption operations¹. Cloud Service Providers (CSPs) can comply with best practices by offering Bring Your Own Key (BYOK) or Hold Your Own Key (HYOK) services to enable customer control of the keys used to encrypt their data. Customer control of the keys allows for the separation, creation, ownership and control, including revocation, of encryption keys or tenant secrets used to create the keys.

CipherTrust Cloud Key Management (CCKM) increases efficiency by reducing the operational burden—even when all of the cloud keys are native keys. Giving customers lifecycle control, centralized management within and among clouds, and visibility of cloud encryption keys reduces key management complexity and operational costs. Customers report that they stepped away from managing keys across a heterogeneous environment and invested in CCKM to enable them to move securely to the cloud—and their cloud use is growing exponentially, reducing management overhead and the potential for security holes.

Control Cloud Encryption Keys

- Leverage the value of BYOK and HYOK services with full- lifecycle cloud encryption key management
- Gain higher efficiency with centralized key management across hybrid, single- and multi-cloud environments, including key discovery, management of native cloud keys and automated key rotation
- Comply with the most stringent data protection mandates with secure key origination
- Amplify the benefits of native keys by using a robust multi-cloud platform with outstanding UI

Best Practices

Industry and internal data protection mandates require increasing protection for sensitive cloud data. Meanwhile, CSA and industry analysts state that cloud encryption keys should be managed by customers. Key management systems (KMSs) can grow to hundreds of master keys per KMS—requiring knowledge of how, when, and by whom encryption keys are used, in addition to backing up, monitoring, rotating, expiring, archiving, suspending, restoring, and destroying keys as needed. CCKM provides comprehensive key lifecycle management to provide visibility on a single pane of glass, and automate and fulfill requirements for safe, comprehensive key management across multiple clouds.

Improved Efficiency

CCKM offers multiple capabilities in support of increasing efficiency:

- Secure centralized key management for Native, BYOK and HYOK cloud keys from a single browser window, across multiple clouds, regions, accounts, subscriptions, projects, applications, org ids, etc.

- Automated synchronization ensuring that cloud console-specific key operations are visible in centralized key management—even if you have already created thousands of native cloud keys at your cloud provider
- Automated key rotation with support for expiring keys ensuring compliance while saving valuable time
- Metadata is collected and laid out in the same order for every cloud provider, removing the need to look for data in disparate places

Single Pane of Glass

Access to each cloud provider from a single console, across multiple accounts, regions, subscriptions and projects makes it easier for organizations to understand how their workloads across different clouds are protected. We continually increase key visibility to make it easier for administrators to manage and control access to the keys in minutes instead of days, and stop threats faster.

Strong Encryption Key Security

Customer key control requires secure key generation and storage. CCKM leverages the security of the CipherTrust Manager, [Luna Network HSM](#), or the Vormetric [Data Security Manager \(DSM\)](#) to create keys with up to FIPS 140-2 Level 3 security.

Hold Your Own Key

CCKM services respond to encryption key requests from cloud providers, support many of the emerging HYOK offerings: AWS External Key Store (XKS); Google Cloud External Key Management (EKM), Google EKM Ubiquitous Data Encryption (UKE), Microsoft 365, and Google Workspace Client-side Encryption for Drive, Gmail, Google Calendar and Google Meet; and Salesforce Cached Keys.

The Compliance Tools You Need

Visibility reports demonstrate compliance to the regulator for mission-critical workloads. Logs may also be directed to a syslog server or Security Information and Event Management (SIEM) tool.

Automation Tools Support Your Initiatives

CCKM capabilities are available programmatically using RESTful APIs, enabling the power of centralized cloud encryption management to work with your automation and self-service initiatives. Interactively explore the APIs with our built-in API playground.

Flexible Deployment Options

Deployment environments include: public cloud, private cloud, hybrid cloud, physical appliances and an as-a cloud-based subscription service.

Regardless of how and where CCKM is deployed, CCKM can manage keys and access to the keys, in any supported cloud.

To meet different organization’s needs, CCKM is available in virtual and physical form factors: Virtual CCKM is an all-software offering easily deployed and can be run in the cloud or on premises and may be found in several cloud provider marketplaces for fast instantiation. Physical appliances are available for customers who prefer an on-prem solution. [CCKM service](#) is available on-demand through the [Thales Data Protection on Demand \(DPoD\) marketplace](#) and in CSP marketplaces.

Multi-cloud Data Security Solutions

CCKM simplifies the need to control and manage encryption keys for cloud services, a critical solution for fulfilling industry and organizational data protection mandates. CCKM and many additional Thales multi-cloud security products, including various [Bring Your Own Advanced Encryption](#) offerings, all with centralized key management, offer you choices on how best to protect all your cloud data. [It’s your data in their cloud.](#)

About Thales

Today’s businesses and governments depend on the cloud, data and software to deliver trusted digital services. That is why the most recognized brands and organizations around the world rely on Thales to help them protect sensitive information and software wherever it is created, stored or accessed – from the cloud and data centers to devices and across networks. As the global leader in data security and software licensing, our solutions enable organizations to move to the cloud securely, achieve compliance with confidence, create more value from their software and deliver seamless digital experiences for millions of consumers every day.

CipherTrust Cloud Key Management Solutions for Amazon Web Services

AWS Key Management Service (AWS KMS) External Key Store (XKS), the new Hold Your Own Key (HYOK) service from Amazon Web Services (AWS), allows customers to protect their data residing in AWS using encryption keys stored outside AWS.

Thales is collaborating with AWS to accelerate the ability of organizations to migrate sensitive data and workloads to the cloud. AWS customers can block and unblock access to encrypted data with keys stored and managed outside of AWS.

CipherTrust Cloud Key Manager

Thales and AWS innovated to create a versatile, feature-rich implementation, providing customers with choices in managing their keys. The collaboration extends the existing key management ownership model of Bring Your Own Key (BYOK) with a Hold Your Own Key (HYOK) offer. With external key store and Thales CipherTrust Cloud Key Manager (CCKM), customers can now choose to have data protected with keys physically located outside of AWS Cloud. The externally stored keys are only accessible via explicit customer authorization. External key store supports most AWS services already integrated with AWS KMS.

Benefits

- Enhance compliance with GDPR in the post Schrems II ruling world by aligning with guidelines from European Data Protection Board (EDPB)
- Improve data sovereignty by providing explicit control over encryption keys outside of the AWS cloud
- Maximize choice from a single console, manage Native, BYOK, HYOK keys across clouds
- Reduce threat surface by centralizing control of keys outside of cloud providers
- Reduce costs by simplifying key management
- Faster time to value by speeding up migration to the cloud

Gain Strong Key Control and Security

External key store enables customers to separate key management from AWS controlled encryption, offering a crucial layer of separation of duty and control. Thales CCKM delivers key generation, reporting, and key lifecycle management that help fulfill internal and industry data protection mandates, with optional FIPS 140-2-certified hardware.

Meet Organizational Needs with Flexible Deployment Options

Thales CCKM is available in virtual and physical form factors: Virtual CCKM is an all-software offering easily deployed and can be run in the cloud or on premises and may be found in several cloud provider marketplaces for fast instantiation. Deployment environments include: public cloud, private cloud, hybrid cloud, and physical appliances. Physical appliances are available for customers who prefer an on-prem solution. Regardless of how and where CCKM is deployed, CCKM can manage keys, and access to the keys, in any reachable, supported cloud.

Increased Efficiency

Thales CCKM centralizes encryption key management from multiple environments, presenting all supported clouds, and even multiple cloud accounts, in a single pane of glass. Advanced cloud key management services and capabilities include automated key rotation, key expiration handling, and cloud key vault synchronization — dramatically reducing the time required for cloud key life cycle management.

In addition to HYOK and BYOK, CCKM supports full key lifecycle management of native cloud keys, including keys stored in AWS CloudHSM.

Align with Best Practices

Deliver compliance, best security practices and control of your data by separating encryption key control from data encryption and decryption operations. Gain operational insights on encryption key usage with reports and logs provided by Thales CCKM.

Integrates With Your Automation Initiatives

CCKM capabilities are available programmatically using RESTful APIs, enabling DevOps and IT teams the power of centralized cloud encryption management to work with the organization's automation and self-service initiatives.

How it Works

External key store is an option within AWS KMS. Once an externally managed key is linked to a KMS key ID using XKS, the externally managed key can be used to protect data in any of the AWS services that integrate with AWS KMS.

External key stores let you control data sovereignty. Data Encryption Keys (DEK) encrypted under KMS keys in the External key store can be decrypted only in the Thales CCKM under your control. When you revoke access to CCKM, by blocking the key or disconnecting the external key store, workloads running in AWS lose all access to your encryption keys, and data encrypted under your keys cannot be decrypted; it is crypto-shredded.

Thales is Here to Help

Contact Thales or [try CCKM for free today](#) to help you assess and define the data protection strategy that best suits your organizational requirements, and for [integration guides](#) to help accelerate your deployment.

About Amazon Web Services

Amazon Web Services (AWS) is the world's most comprehensive and broadly adopted cloud offering, with more than 200 fully featured services available from data centers globally. Millions of customers — including the fastest-growing startups, largest enterprises, and leading government agencies — are using AWS to lower costs, increase security, become more agile, and innovate faster.

About Thales

As the global leader in data security, Thales helps the most trusted brands and organizations around the world protect their most sensitive data and software, secure the cloud, provide seamless digital experiences, and achieve compliance through our industry-leading data encryption, identity and access management, and software licensing solutions.

CipherTrust Cloud Key Manager

Cloud Encryption Key Lifecycle Management

Industry best practices as defined by the Cloud Security Alliance (CSA), require that keys be stored and managed outside of the cloud service provider and the associated encryption operations (See CSA CCM EKM-04). Cloud Service Providers (CSPs) can comply with best practices by offering Bring Your Own Key (BYOK) or Hold Your Own Key (HYOK) services to enable customer control of the keys used to encrypt their data. Customer key control allows for the separation, creation, ownership and control, including revocation, of encryption keys or tenant secrets used to create the keys.

CipherTrust Cloud Key Manager (CCKM) reduces key management complexity and operational costs by giving customers lifecycle control of cloud encryption keys with centralized management and visibility by leveraging cloud provider BYOK APIs or servicing HYOK requests.

Control Cloud Encryption Keys

- Leverage the value of BYOK and HYOK services with full-lifecycle cloud encryption key management
- Gain higher efficiency with centralized key management across hybrid, single- and multi-cloud environments, including key discovery, management of native cloud keys and automated key rotation
- Comply with the most stringent data protection mandates with secure key origination

Supported clouds and key management ownership models:

Best Practices

Industry and internal data protection mandates require increasing protection for sensitive cloud data. Meanwhile, CSA and industry analysts state that cloud encryption keys should be managed by customers. Key management can grow to hundreds of master keys per KMS—requiring knowledge of how, when, and by whom encryption keys are used, in addition to backing up, monitoring, rotating, expiring, archiving, suspending, restoring, and destroying keys as needed. CCKM provides comprehensive key lifecycle management to provide visibility on a single pane of glass, and automate and fulfill requirements for safe, comprehensive key management across multiple clouds.

Single Pane of Glass

Access to each cloud provider from a single browser window, across multiple accounts, regions, subscriptions and projects.

Improved Efficiency

CCKM offers multiple capabilities in support of increasing efficiency:

- Full management of cloud keys enabling centralized multicloud key management—even if that management is for native keys
- Automated synchronization ensuring that cloud console-specific key operations are visible in centralized key management
- Automated key rotation with support for expiring keys ensuring compliance while saving valuable time
- Key operations presented in the semantics of the cloud provider, removing the need to learn additional key technologies and terminology

Strong Encryption Key Security

Customer key control requires secure key generation and storage. CCKM leverages the security of the [CipherTrust Manager](#), [Luna Network HSM](#), or the Vormetric [Data Security Manager \(DSM\)](#) to create keys with up to FIPS 140-2 Level 3 security.

Hold Your Own Key

CCKM services respond to encryption key requests from cloud providers, supporting many of the emerging HYOK offerings: AWS External Key Store (XKS); Google Cloud External Key Management (EKM), Google EKM Ubiquitous Data Encryption (UDE), and Google Workspace Client-side Encryption for Drive, Gmail, Google Calendar and Google Meet; and Salesforce Cached Keys.

The Compliance Tools You Need

CipherTrust Cloud Key Manager visibility reports enable confirmation of compliance. Logs may also be directed to a syslog server or Security Information and Event Management (SIEM) tool.

Automation Tools Support Your Initiatives

CCKM capabilities are available programmatically using RESTful APIs, enabling the power of centralized cloud encryption management to work with your automation and self-service initiatives. Interactively explore the APIs with our built-in API playground.

Flexible Deployment Options

Deployment environments include: public cloud, private cloud, hybrid cloud, and physical appliances.

Regardless of how and where CCKM is deployed, CCKM can manage keys, and access to the keys, in any supported cloud.

To meet different organization's needs, CCKM is available in virtual and physical form factors: Virtual CCKM is an all-software offering easily deployed and can be run in the cloud or on premises and may be found in several cloud provider marketplaces for fast instantiation. Physical appliances are available for customers who prefer an on-prem solution.

Multi-cloud Data Security Solutions

CCKM simplifies the need to control and manage encryption keys for cloud services, a critical solution for fulfilling industry and organizational data protection mandates. CCKM and many additional Thales multi-cloud security products, including various [Bring Your Own Advanced Encryption](#) offerings, all with centralized key management, offer you choices on how best to protect all your cloud data. [It's your data in their cloud.](#)

About Thales

The people you rely on to protect your privacy rely on Thales to protect their data. When it comes to data security, organizations are faced with an increasing number of decisive moments. Whether the moment is building an encryption strategy, moving to the cloud, or meeting compliance mandates, you can rely on Thales to secure your digital transformation.

Decisive technology for decisive moments.

Solution Brief

Thales CipherTrust Cloud Key Management for **Salesforce**

Providing customers with
encryption key options

cpl.thalesgroup.com

THALES
Building a future we can all trust

Due to a growing number of requirements, including security and sovereignty mandates, organizations need to control their data. This is particularly challenging for enterprises using SaaS-based solutions since they do not directly manage, host, or even own the cloud-based platform containing their data.

Managing encryption keys and storing them securely is the cornerstone to meeting data security and sovereignty requirements. This is because encryption keys (also called cryptographic keys) are the strings of bits generated to encode and decode data. Whoever owns and manages the keys, therefore also ultimately owns the data. This is why organizations must prove they manage and control their encryption keys to be compliant with many digital sovereignty and data protection requirements.

Additionally, ensuring control over encryption keys can bolster security for SaaS-based applications in the event of a cyber-attack since the keys are stored and managed separately from the data.

The Solution

Thales and Salesforce have partnered to provide enterprise customers with choices in managing their data encryption keys for Salesforce data.

External Key Management

Thales can enable digital sovereignty for organizations using Salesforce by ensuring they retain more control and management over their encryption keys with our CipherTrust Cloud Key Management (CCKM) offering. By using Thales CCKM, organizations can safely store, manage, and maintain the tenant secrets used to derive the encryption keys that protect data within the Salesforce environment.

Thales CCKM delivers key generation, reporting, and key lifecycle management that helps fulfill internal and industry data protection mandates. To securely store encryption keys, customers can leverage Thales CipherTrust Manager with optional FIPS 140-2 Level 3 certified

HSM card or Luna Network Hardware Security Modules (HSMs) that securely protect cryptographic keys in a high-assurance, tamper-resistant, network-attached appliance that is FIPS 140-2 Level 3 certified.

By using Thales CCKM, Salesforce customers can implement Cache-Only Keys, Bring-Your-Own-Key (BYOK) and Hold-Your-Own-Key (HYOK) capabilities. By leveraging these options, customers retain more control of their encryption keys - and therefore also their encrypted data. This helps organizations meet compliance and best practice requirements for encryption key management, data security, and digital sovereignty.

Additionally, Thales supports Salesforce External Key Management (EKM) service for Salesforce Shield Platform Encryption, allowing users to provide and manage their own encryption keys that protect their Salesforce content. The combined Salesforce and Thales solution leverages the AWS External Key Store (XKS) service so customers can protect their Salesforce data using encryption keys stored physically outside the cloud.

Thales Encryption Key Management Solutions with Salesforce

Salesforce and Thales - Solution Overview

Flexible Deployment Options

Both Thales CCKM and Luna HSMs are available in both virtual and physical form factors. Virtual CCKM is an all-software offering easily deployed and can be run in the cloud or on-premises and may be found in several cloud provider marketplaces including AWS and Salesforce Hyperforce. Deployment environments include public cloud, private cloud, hybrid cloud, and physical appliances. Physical appliances are available for customers who prefer an on-premises solution.

Increased Efficiency

Thales CCKM centralizes encryption key management across all supported clouds, and multiple cloud accounts, regions, subscriptions, org IDs and projects, from a single pane of glass. Advanced cloud key management services and capabilities include automated key rotation, key expiration handling, and cloud key inventory--dramatically reducing the time required for cloud key life cycle management.

Best Practices

Together, Thales and Salesforce offer security best practices (such as CSA CCM EKM-04), control of customer data by separating key control from data encryption/decryption operations, and help gain operational insights on encryption key usage with reports and logs provided by Thales CCKM.

About Salesforce

Salesforce empowers companies of every size and industry to connect with their customers through the power of CRM + AI + Data + Trust. For more information about Salesforce, visit: www.salesforce.com.

About Thales

Today's businesses and governments depend on the cloud, data and software to deliver trusted digital services. That is why the most recognized brands and organizations around the world, rely on Thales to help them protect sensitive information and software wherever it is created, stored or accessed – from the cloud and data centers to devices and across networks. As the global leader in data security, identity & access management, and software licensing, our solutions enable organizations to move to the cloud securely, achieve compliance with confidence, create more value from their software and deliver seamless digital experiences for millions of consumers every day.

White Paper

NIST 800-57 **Recommendations** **for Key Management** **Requirements** **Analysis**

cpl.thalesgroup.com

THALES
Building a future we can all trust

The National Institute of Standards and Technology (NIST) Special Publication (SP) 800-57, Recommendations for Key Management Part 1 (Rev 5) provides guidance for cryptographic key management for U.S. Federal Government agencies. Part 1 of the publication outlines best practices for the management of cryptographic keys and discusses key management issues that must be addressed with using cryptography.

Importance of Securing Cryptographic Keys

The security of cryptographic processes is dependent on the security of the cryptographic keys used to encrypt the data. If the keys used to encrypt data are stolen with the encrypted data, the data is not secure because it can be deciphered and read in plain text.

NIST emphasizes the importance of protecting cryptographic keys in the publication, "The proper management of cryptographic keys is essential to the effective use of cryptography for security. Poor key management may easily compromise strong algorithms."¹ NIST states that:

*Ultimately, the security of information protected by cryptography directly depends on the strength of the keys, the effectiveness of cryptographic mechanisms and protocols associated with the keys, and the protection provided to the keys. Secret and private keys need to be protected against unauthorized disclosure, and all keys need to be protected against modification.*¹

For encryption to successfully secure sensitive data, the cryptographic keys themselves must be secured, managed and controlled by your organization and not a third-party or cloud provider. As agencies deploy ever-increasing numbers of siloed encryption solutions, they find themselves managing inconsistent policies, different levels of protection, and escalating costs.

The simplest path through this maze is to transition to a centralized key management model. Encryption key management involves administering the full lifecycle of cryptographic keys and protecting them from loss or misuse. Keys have a life cycle: They're created, live useful lives, and are retired. Key lifecycle management includes generating, using, storing, distributing, archiving, and deleting keys.

CipherTrust Data Security Platform

CipherTrust Data Security Platform (CDSP) offers a unified, scalable solution for protecting sensitive data across on-premises, cloud, and hybrid environments. Designed to simplify and strengthen data security, the platform centralizes critical capabilities such as data discovery, encryption, access controls, and compliance reporting.

CDSP is managed by CipherTrust Manager (CM), which is a centralized key management solution for enterprises, providing a unified console for managing encryption keys across on-premises and cloud environments. It simplifies key lifecycle management, including generation, backup, and deletion, while enforcing role-based access control and security policies. It also offers features like multi-tenancy support, robust auditing, and a REST API for custom solutions.

A cornerstone of CDSP is its robust key management functionality, which empowers organizations to securely create, store, rotate, and manage encryption keys across diverse systems and services. With support for FIPS 140-2 L1-compliant hardware security modules (HSMs) and integrations with major cloud providers, CDSP ensures that encryption keys remain under enterprise control—reducing risk and helping meet regulatory mandates.

CDSP streamlines operations with automated policies and centralized oversight, allowing security teams to confidently enforce data protection without disrupting performance. Whether securing databases, files, containers, or applications, CDSP delivers a comprehensive, policy-driven framework for managing and safeguarding critical data and the cryptographic keys that protect it.

Platform Benefits

Robust Key Management, Encryption and Tokenization

CDSP offers encryption solutions to protect data while it is stored on-premises, in the cloud, or in backups. CDSP supports transparent encryption, which means that data can be encrypted without requiring changes to applications or workflows. CDSP provides centralized key

¹<https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NISTSP800-57pt1r5.pdf>

management to ensure that encryption keys are securely generated, stored, and managed. Tokenization replaces sensitive data with non-sensitive tokens, making it difficult for unauthorized individuals to access or misuse the data. CDSP supports dynamic data masking which allows sensitive data to be masked or redacted in real time, preventing unauthorized access even when data is in use.

Take Control of Your Sensitive Data Across Clouds

CDSP provides solutions for protecting data in public, private, and hybrid cloud environments. The platform integrates with popular cloud platforms such as AWS, Azure, and GCP. Centralizes multi cloud key management for BYOK, HYOK and cloud native encryption keys across any combination of clouds and on-premises with a single UI.

Integrate Security into Development improving DevSecOps efficiency

CDSP can be integrated into DevOps workflows to ensure that security is built into applications from the beginning. The platform provides solutions for protecting sensitive data during development, testing, and deployment. It rapidly secures, deploys and runs cloud-native workloads across cloud service providers and speed-up continuous integration and continuous delivery processes.

Managing Compliance and Risk

As part of CDSP, Data Risk Intelligence provides visibility into where your data sources that contain sensitive data are. It identifies the encryption status of each data source and offers recommendations on how to meet encryption goals. CDSP helps organizations comply with data protection regulations such as GDPR, HIPAA, and PCI DSS. By protecting sensitive data, CDSP can help organizations reduce the risk of data breaches and other security incidents. File Activity Monitoring (FAM) delivers real-time visibility into file usage, encryption status, and sensitive data access, enabling proactive threat detection and data protection across your organization.

Manage and Automate Access to Secrets

CipherTrust Secrets Management (CSM) offers a range of capabilities to securely store, manage, and distribute secrets across different developer environments, ensuring that they are protected from unauthorized access and misuse. It improves developer efficiency and centralizes management for all secret types with scalable SaaS.

Discovering and Classifying your Sensitive Data

CDSP helps organizations discover and classify sensitive data across their entire infrastructure, including files, databases, and big data. It provides visibility into where sensitive data resides and how it is being accessed, helping organizations assess their risk and prioritize protection efforts. It automatically scans and detects code containing sensitive information (API keys, tokens, passwords, etc.) mistakenly included by developers.

NIST SP 800-57 Requirements Mapping

Focusing on the capabilities needed to meet the requirements outlined in NIST SP 800-57, the following table provides details on CipherTrust Platform.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
6	Protection Requirements for Key Information		
6.1	Protection and Assurance Requirements	✓	CipherTrust Manager is available in both virtual and physical appliances, offering FIPS 140-2 L2 certifications to meet diverse security requirements. Virtual deployments can integrate with various network-accessible Hardware Security Modules (HSMs) to establish a FIPS 140 Level 3 root of trust. CipherTrust Manager supports deployment on-premises and across private or public cloud environments. For enhanced protection, its disk can be fully encrypted, with encryption initiated either during initial launch or applied to an already running instance.
6.1.1	Summary of Protection and Assurance Requirements for Cryptographic Keys	✓	
6.1.2	Summary of Protection Requirements for Other Related Information	✓	

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
6.2	Protection Mechanisms	✓	CipherTrust Manager is available as both virtual and physical appliances, offering FIPS 140-2 L2 certifications. The appliance supports full disk encryption and can be deployed in high-availability, Active/Active clustered configurations. Real-time replication of keys, policies, and configurations enables seamless disaster recovery and business continuity across multiple instances.
6.2.1	Protection Mechanisms for Key Information in Transit	✓	
6.2.1.1	Availability	✓	CipherTrust Manager ensures high availability through clustered deployment options and redundant communication paths between nodes.
6.2.1.2	Integrity	✓	Supports secure transmission of key materials and policies using TLS/SSL to maintain integrity during transit.
6.2.1.3	Confidentiality	✓	Utilizes TLS-encrypted communications and optional client authentication to ensure confidentiality of key exchanges and administrative sessions.
6.2.1.4	Association with Usage or Application	✓	Supports PKCS #11, JCE, .NET, and the Key Management Interoperability Protocol (KMIP) to bind keys to specific usage contexts and applications. Additionally, the SafeNet REST API allows integration with custom applications using enterprise-grade key management
6.2.1.5	Association with Other Entities	✓	Keys can be explicitly associated with users, applications, or services through role-based and attribute-based access controls.
6.2.1.6	Association with Other Related Key Information	✓	Offers granular access control via Attribute-Based Access Control (ABAC), ensuring that keys are only used in authorized contexts. Also supports: - Secure key distribution using SSL - Secure storage of key encryption keys in Luna Network HSMs
6.2.2	Protection Mechanisms for Key Information in Storage	✓	
6.2.2.1	Availability	✓	High-availability clustering and replication ensure keys remain accessible across failovers and maintenance events.
6.2.2.2	Integrity	✓	Key material is stored securely and verified using checksums and cryptographic validation mechanisms.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
6.2.2.3	Confidentiality	✓	When integrated with CipherTrust Transparent Encryption (CTE), keys are securely passed over encrypted channels. Admin access occurs via HTTPS, and communication between agents and the manager is encrypted using ephemeral session keys, minimizing exposure and enhancing confidentiality.
6.2.2.4	Association with Usage or Application	✓	CipherTrust Manager binds keys to specific applications or data sets through policy-driven associations and APIs, ensuring precise usage control.
6.2.2.5	Association with Other Entities	✓	Keys are mapped to users, roles, or services through defined policies and fine-grained access controls.
6.2.2.6	Association with Other Related Key Information	✓	Relationships between keys and associated metadata (e.g., rotation dates, ownership, tags) are preserved and managed via policy
6.2.3	Metadata for Keys	✓	Keys managed by CipherTrust Manager contain a single metadata record, which can link to multiple versions of the key. Each version is uniquely tracked, providing a detailed audit trail for compliance and lifecycle management.
7	Key States and Transitions		
7.1	Pre-activation State	✓	CipherTrust Manager provides centralized key lifecycle management for all CipherTrust Data Security Platform products. Built on an extensible microservices architecture, it supports all standard key states—from generation through retirement—ensuring secure and auditable transitions throughout the lifecycle. Key management capabilities include: - State transitions such as activation, suspension, deactivation, compromise, and destruction - Role-based access control (RBAC) for fine-grained key and policy management - Multi-tenancy support to isolate keys and operations across users or departments - Comprehensive auditing and reporting for key usage, operational changes, and policy enforcement CipherTrust Manager also supports secure key generation, backup and recovery, and policy-driven actions to manage compromised or decommissioned keys.
7.2	Active State	✓	
7.3	Suspended State	✓	
7.4	Deactivated State	✓	
7.5	Compromised State	✓	
7.6	Destroyed State	✓	

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
8	Key-Management Phases and Functions		
8.1	Pre-operational Phase	✓	The CipherTrust Data Security Platform supports comprehensive key management functions that are logically separated from standard operations. These functions include domain creation, key creation, host registration, system initialization, and audit logging.
8.1.1	Entity Registration Function	✓	In multi-domain environments, users and administrators are logically isolated. Admins can select different encryption algorithms and key lengths per domain, increasing flexibility and control. Supported algorithms include AES-128 and AES-256.
8.1.2	System Initialization Function	✓	
8.1.3	Initialization Function	✓	
8.1.4	Keying-Material Installation Function	✓	Encrypted communications between CipherTrust Manager (CM) and agents are configurable.
8.1.5	Key Establishment Function	✓	The platform supports TLS 1.2+ using its REST API to ensure secure key delivery and API access. Key establishment is handled through CipherTrust Transparent Encryption (CTE) or agent-based solutions, where selectable encryption methods are applied per deployment requirement.
8.1.5.1	Generation and Distribution of Asymmetric Key Pairs	✓	Secure control paths exist between: - The daemon on the host - The SecFS kernel module responsible for system-level security Steps for key pair generation: - CM creates a public/private key pair - A Certificate Signing Request (CSR) is generated - The signed certificate is returned and stored in CM's secure database When operating in agent mode, the user space portion of the agent creates a local key pair and sends a CSR to CM. The signed certificate is returned and installed to complete registration. The kernel space portion also generates a key pair, and sends its public key to CM to complete secure host provisioning.
8.1.5.1.1	Distribution of Public Keys	✓	
8.1.5.1.1.1	Distribution of a Trust Anchor's Public Key in a PKI	✓	
8.1.5.1.1.2	Submission to a Registration Authority or Certification Authority	✓	
8.1.5.1.1.3	General Distribution of Static Public Keys	✓	
8.1.5.1.2	Distribution of Ephemeral Public Keys	✓	
8.1.5.1.3	Distribution of Centrally Generated Key Pairs	✓	

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
8.1.5.2	Generation and Distribution of Symmetric Keys	✓	Key generation supports standards-compliant symmetric algorithms and configurable key lengths
8.1.5.2.1	Key Generation	✓	Key distribution is supported via: Manual distribution (for controlled environments)
8.1.5.2.2	Key Distribution	✓	Automated distribution and key wrapping
8.1.5.2.2.1	Manual Key Distribution	✓	Keys are associated with policies that define lifecycle states, access controls, and allowed usage
8.1.5.2.2.2	Automated Key Distribution/Key Transport/Key Wrapping	✓	
8.1.5.2.2.3	Key Agreement	✓	Support for key agreement protocols can be configured via CipherTrust Manager's API and agent-based workflows, depending on the environment and policy enforcement needs.
8.1.5.3	Generation and Distribution of Other Keying Material	✓	CipherTrust Manager supports the secure generation and distribution of other cryptographic materials, such as initialization vectors, shared secrets, RBG seeds, random numbers, and passwords. These are passed between the CipherTrust Manager and hosts via a one-time-use AES-256 random key generated by the Manager. The random key encrypts the desired encryption keys. This AES key is then encrypted using the kernel-space public key of the host. The encrypted payload is delivered to the host, where the kernel-space private key decrypts the random key. The decrypted random key is used to decrypt the actual encryption keys, which are then applied to the target file, directory, or executable. This method ensures secure in-transit handling of sensitive materials like initialization vectors, shared
8.1.5.3.1	Domain Parameters	✓	
8.1.5.3.2	Initialization Vectors	✓	
8.1.5.3.3	Shared Secrets	✓	
8.1.5.3.4	RBG Seeds	✓	
8.1.5.3.5	Other Public and Secret Information	✓	
8.1.5.3.6	Intermediate Results	✓	
8.1.5.3.7	Random Bits/Numbers	✓	
8.1.5.3.8	Passwords	✓	
8.1.6	Key Registration Functiony	✓	CipherTrust Manager supports automated key registration and lifecycle management, allowing keys to be registered during generation or securely imported from external systems. Registered keys are tagged, versioned, and governed by policies such as expiration, usage, and rotation.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
8.2	Operational Phase	✓	CipherTrust Manager provides comprehensive tools for managing cryptographic keys throughout their operational lifecycle. This includes: • Key generation, import, export, and rotation • Support for symmetric and asymmetric key types • Control over key size, usage constraints, and policy enforcement All keys are stored in a centralized, hardware or virtual appliance, simplifying operations while enforcing strong access controls and auditability. CipherTrust Manager also supports Active/Active clustering for high availability, ensuring continuous uptime for encryption and key management services.
8.2.1	Normal Operational Storage Function	✓	
8.2.1.1	Cryptographic Module Storage	✓	All keys are securely stored inside CipherTrust Manager, a FIPS-certified cryptographic module, ensuring isolation, protection, and compliance with international standards.
8.2.1.2	Immediately Accessible Storage Media	✓	Keys are readily available to authorized services and applications during runtime, while access is tightly controlled through policy-based authorization, role-based access control (RBAC), and secure API communication.
8.2.2	Continuity of Operations Function	✓	CipherTrust Manager supports high-availability deployments, including Active/Active configurations, for continuous access to keys and services. This architecture allows for automatic failover and synchronized replication, ensuring that encryption and key management operations continue uninterrupted even during system events or outages.
8.2.2.1	Backup Storage	✓	CipherTrust Manager uses backup encryption keys to securely protect key backups. Administrators can: • Generate a new backup encryption key, or • Reuse an existing key when creating backups Backup keys are stored encrypted using a secure vault within CipherTrust Manager. Each backup may include critical data such as user keys or database dumps, all encrypted according to the system's configured key hierarchy. A final encrypted backup file is generated using the designated backup key, ensuring secure recovery and compliance with retention and protection policies.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
8.2.2.2	Key Recovery Function	✓	CipherTrust Manager supports robust key recovery capabilities, including key generation, backup, restore, deactivation, and deletion. Keys are versioned and archived, supporting rapid recovery when needed. With version control and Thales Live Data Transformation (CTE-LDT), restored keys can be automatically aligned to historical data states. During recovery, keys retrieved from backup are securely applied to the relevant datasets, with encryption maintained using current cryptographic policies.
8.2.3	Key Change Function	✓	CipherTrust Manager supports:
8.2.3.1	Re-keying	✓	Key change for replacing compromised or outdated keys
8.2.3.2	Key Update Function	✓	Re-keying, enabling seamless replacement of keys without interrupting operations Key update workflows that apply newer keys to older datasets as part of a versioned lifecycle process All updates are governed by policy-based controls and audit logging for traceability.
8.2.4	Key Derivation Methods	✓	Enforces secure key derivation methods, centralizes control, automates policy enforcement, and ensures compliant key lifecycle management.
8.3	Post-Operational Phase	✓	
8.3.1	Key Archive and Key Recovery Functions	✓	Securely archiving keys, enabling authorized recovery, enforcing access controls, and ensuring compliance with cryptographic key management policies.
8.2.3	Key Change Function	✓	CipherTrust Manager supports:
8.2.3.1	Re-keying	✓	Key change for replacing compromised or outdated keys
8.2.3.2	Key Update Function	✓	- Re-keying, enabling seamless replacement of keys without interrupting operations - Key update workflows that apply newer keys to older datasets as part of a versioned lifecycle process All updates are governed by policy-based controls and audit logging for traceability.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
8.2.4	Key Derivation Methods	✓	CipherTrust supports secure key derivation methods consistent with industry standards. Derived keys are created based on unique, application-specific inputs and comply with approved cryptographic standards for secure usage.
8.3	Post-Operational Phase	✓	CipherTrust Manager retains cryptographic materials per policy after their active use has ended, allowing for secure archival, auditing, or decommissioning.
8.3.1	Key Archive and Key Recovery Functions	✓	CipherTrust Manager supports secure archiving of retired or inactive keys. Archived keys remain accessible for approved recovery scenarios and are stored using encryption consistent with active key policies. Archived keys can be restored based on versioned metadata Policy controls govern access and retention
8.3.2	Entity De-registration Function	✓	CipherTrust Manager allows for full lifecycle control of clients (e.g., ProtectFile, ProtectV, CTE). Administrators can: • Register and manage client entities (excluding ProtectFile clients) • View, modify, revoke, or delete client registrations as needed Once a client is deregistered, all communication with CipherTrust Manager is terminated, ensuring immediate and complete disassociation.
8.3.3	Key De-registration Function	✓	Within CipherTrust Manager there is a Key Admins group. Key Administrators have permissions to managing keys on the system. They can: • create or modify their own keys • perform key management operations on keys created by all users on the system
8.3.4	Key Destruction Function	✓	
8.3.5	Key Revocation Function	✓	
8.4	Destroyed Phase	✓	There is a System Defined Group named "CTE Admins". Users within the "CTE Admins" group are CTE Administrators. Only users of the "CTE Admins" group can delete CTE keys. Depending on the Key Management usecase a specified admin within CipherTrust Manager will be able to manage keys or delete keys that are not in use.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
8.3.3	Key De-registration Function	✓	Within CipherTrust Manager, a designated Key Admins group manages key de-registration. Admins have permissions to: • Create and manage their own keys • Perform operations on other keys based on their assigned privileges Key de-registration removes keys from operational use but retains metadata for audit if required.
8.3.4	Key Destruction Function	✓	Only users in the System Defined Group: "CTE Admins" have permission to permanently destroy keys (such as CTE policies and associated keys). Keys marked for deletion are securely removed based on policy and usage state Only unused or expired keys can be deleted, ensuring cryptographic continuity
8.3.5	Key Revocation Function	✓	CipherTrust Manager supports key revocation based on usage status or compromise events. Revoked keys are: • Immediately marked as inactive • Prevented from being used in future encryption or decryption operations • Tracked in audit logs for compliance and incident response
8.4	Destroyed Phase	✓	The Destroyed Phase ensures that cryptographic keys are irretrievably deleted when no longer needed. Only authorized administrators (e.g., CTE Admins) can initiate destruction Keys must be inactive or non-operational before destruction Destruction operations are logged to maintain audit integrity
9	Additional Considerations		
9.1	Access Control and Identity Authentication	✓	CipherTrust Manager enhances access control through kernel-level agents and AES-256 encryption, surpassing typical OS-level controls. It enforces least privilege access, allowing only authenticated administrators and clients to communicate with the Manager. Integration with role-based access controls ensures secure, policy-driven identity management.

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
9.2	Inventory Management	✓	CipherTrust Manager provides centralized inventory visibility and lifecycle management for all cryptographic keys and certificates across the CipherTrust Data Security Platform. Its microservices-based architecture simplifies operations such as key generation, rotation, backup, archival, and deletion.
9.2.1	Key Inventories	✓	All cryptographic keys are cataloged with metadata such as key type, usage, status, creation date, and expiration, enabling full visibility and control across environments.
9.2.2	Certificate Inventories	✓	CipherTrust Manager tracks certificates used for encryption, authentication, and digital signing. Each certificate is indexed for quick retrieval and lifecycle management.
9.3	Accountability	✓	All user and administrative actions within CipherTrust Manager are fully auditable and attributable through detailed logs. These logs include timestamps, user roles, affected objects (e.g., keys, policies), and the nature of each action, helping ensure accountability and support for internal or external audits.
9.4	Audit	✓	CipherTrust Manager generates comprehensive audit logs capturing all key lifecycle operations (e.g., generation, access, modification, rotation, deletion). Logs are tamper-resistant and can be forwarded to external SIEM systems or retained locally for compliance. This capability ensures full traceability for audit and compliance purposes.
9.5	Key-Management System Survivability	✓	CipherTrust Manager supports high availability through clustered deployments with real-time replication of keys, policies, and configuration data across appliances. This architecture supports: - Seamless failover and disaster recovery - No disruption to cryptographic operations - Centralized key management across distributed environments with minimal performance impact

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
9.5.1	Backed Up and Archived Key	✓	CipherTrust Manager automatically creates versioned backups of all cryptographic keys. Backups: • Are stored securely on the appliance • Remain available until explicitly deleted • Can be restored on the same or another appliance • Are always encrypted using a designated backup key If a specific backup key is not provided, a default backup key is used to ensure data protection and future recovery.
9.5.2	Key Recovery	✓	During key recovery, backup files—encrypted using the assigned or default backup key—can be: • Downloaded from the appliance • Re-uploaded to the same or a different CipherTrust Manager appliance • Decrypted and restored using the required backup key This enables secure restoration of archived encryption keys for operational continuity and compliance with retention policies.
9.5.3	System Redundancy/Contingency Planning	✓	CipherTrust Manager supports robust system redundancy and contingency planning through clustered deployments with real-time replication of keys, policies, and configurations across multiple appliances. This setup ensures high availability, seamless failover, and disaster recovery Organizations with multiple encryption endpoints can centrally manage keys without disrupting system performance Business continuity is preserved even during infrastructure failure scenarios

NIST 800-57 Reference	Requirement	Requirement Met	CipherTrust Platform
9.5.3.1	General Principles	✓	CipherTrust Manager supports Active/Active high availability deployments to ensure minimal downtime. Designed for 24x7 operations with full support for uninterrupted key management and encryption services All keys and related policies are versioned and securely stored, allowing seamless recovery in the event of failure or compromise
9.5.3.2	Cryptography and Key-Management-Specific Recovery Issues	✓	CipherTrust Manager maintains comprehensive backups and versioning of keys. These capabilities allow: • Recovery of archived encryption keys aligned with the original version of protected data • Secure application of keys to historical datasets through Live Data Transformation, preserving data integrity • Controlled and auditable recovery procedures in line with cryptographic best practices
9.5.4	Compromise Recovery	✓	In the event of a key compromise, CipherTrust Manager enables recovery via Live Data Transformation, which allows data encrypted with a compromised key to be seamlessly re-encrypted using a new, secure key. This eliminates the need to re-ingest or decrypt raw data manually Recovery operations are automated, secure, and aligned with enterprise-grade data protection policies

About Thales

Thales is a global leader in cybersecurity, helping the most trusted organizations protect critical applications, data, identities, and software anywhere, at scale. Through Thales' integrated platforms, customers achieve better visibility of risks, defend against cyber threats, close compliance gaps, and deliver trusted digital experiences for billions of consumers every day.

AggregationController

GET /aggregate

Up

Gets the aggregation metrics (runAggregationUsingGET)

Request headers

Cookie

Provide the JsessionId [String](#)

X-XSRF-TOKEN

Provide the token information [String](#)

x-sessionid

Provide the service session id [String](#)

x-tenant

Provide the cloud service name [String](#)

x-user

Provide the user name [String](#)

Return type

String

Example data

Content-Type:

Produces

This API call produces the following media types according to the Accept request header; the media type will be conveyed by the Content-Type response header.

- * / *

Responses

200

OK [String](#)
401
Unauthorized
403
Forbidden
404
Not Found

AwsKeyEntity

PUT [Up](#) `/rest/awsKeys/{id}/autorotate`

Enable or disable an AWS key to be auto rotated in this user's KEY_ROTATION schedule (`autorotateUsingPUT`)

Path parameters

id (required)
Path Parameter — id

Consumes

This API call consumes the following media types via the Content-Type request header:

- `application/json`

Request body

data [AutoRotateRequestData](#) (required)
Body Parameter — data

Request headers

Cookie
Provide the JsessionId [String](#)
X-XSRF-TOKEN
Provide the token information [String](#)
x-sessionid
Provide the service session id [String](#)
x-tenant
Provide the cloud service name [String](#)
x-user
Provide the user name [String](#)

Return type

String

Example data

Content-Type:

Produces

This API call produces the following media types according to the Accept request header; the media type will be conveyed by the Content-Type response header.

- `*/*`

KeyVaultController

POST /keyvaultkey

Up

Create source (DSM or nshield) key (createKeyUsingPOST)

Consumes

This API call consumes the following media types via the Content-Type request header:

- application/json

Request body

key [KeyVaultKey](#) (required)
Body Parameter — Source key parameters (service, cckmld, name, algorithm)

Request headers

Cookie
Provide the JsessionId [String](#)
X-XSRF-TOKEN
Provide the token information [String](#)
x-sessionid
Provide the service session id [String](#)
x-tenant
Provide the cloud service name [String](#)
x-user
Provide the user name [String](#)

Query parameters

page (optional)
Query Parameter — format: int32

sid (optional)
Query Parameter — sid

size (optional)
Query Parameter — format: int32

sort (optional)
Query Parameter —

Return type

[KeyVaultKey](#)

Example data

Content-Type:

Produces

This API call produces the following media types according to the Accept request header; the media type will be conveyed by the Content-Type response header.

CipherTrust Cloud Key Manager Installation & Configuration Guide

Release 1.10.3

Document Version 1

July 15, 2022

CipherTrust Cloud Key Manager Installation & Configuration Guide

1.10.3

Document Version 1

July 15, 2022

All information herein is either public information or is the property of and owned solely by Thales DIS France S.A. and/or its subsidiaries or affiliates who shall have and keep the sole right to file patent applications or any other kind of intellectual property protection in connection with such information.

Nothing herein shall be construed as implying or granting to you any rights, by license, grant or otherwise, under any intellectual and/or industrial property rights of or concerning any of Thales DIS France S.A. and any of its subsidiaries and affiliates (collectively referred to herein after as "Thales") information.

This document can be used for informational, non-commercial, internal and personal use only provided that:

- The copyright notice below, the confidentiality and proprietary legend and this full warning notice appear in all copies.
- This document shall not be posted on any network computer or broadcast in any media and no modification of any part of this document shall be made.

Use for any other purpose is expressly prohibited and may result in severe civil and criminal liabilities.

The information contained in this document is provided "AS IS" without any warranty of any kind. Unless otherwise expressly agreed in writing, Thales makes no warranty as to the value or accuracy of information contained herein.

The document could include technical inaccuracies or typographical errors. Changes are periodically added to the information herein. Furthermore, Thales reserves the right to make any change or improvement in the specifications data, information, and the like described herein, at any time.

Thales hereby disclaims all warranties and conditions with regard to the information contained herein, including all implied warranties of merchantability, fitness for a particular purpose, title and non-infringement. In no event shall Thales be liable, whether in contract, tort or otherwise, for any indirect, special or consequential damages or any damages whatsoever including but not limited to damages resulting from loss of use, data, profits, revenues, or customers, arising out of or in connection with the use or performance of information contained in this document.

Thales does not and shall not warrant that this product will be resistant to all possible attacks and shall not incur, and disclaims, any liability in this respect. Even if each product is compliant with current security standards in force on the date of their design, security mechanisms' resistance necessarily evolves according to the state of the art in security and notably under the emergence of new attacks. Under no circumstances, shall Thales be held liable for any third party actions and in particular in case of any successful attack against systems or equipment incorporating Thales products. Thales disclaims any liability with respect to security for direct, indirect, incidental or consequential damages that result from any use of its products. It is further stressed that independent testing and verification by the person using the product is particularly encouraged, especially in any application in which defective, incorrect or insecure functioning could result in damage to persons or property, denial of service or loss of privacy.

Copyright 2009 - 2022 Thales Group. All rights reserved. Thales and the Thales logo are trademarks and service marks of Thales and/or its subsidiaries and affiliates and are registered in certain countries. All other trademarks and service marks, whether registered or not in specific countries, are the properties of their respective owners.

Contents

Preface	17
Intended audience	17
Document Conventions	17
Typographical Conventions	17
Notes, Tips, Cautions, and Warnings	18
Hardware-Related Warnings	18
Sales and Support	19
 Chapter 1: Overview	 20
CCKM Components	20
Supported Clouds	21
Supported Key Sources	21
Supported Databases	21
Supported Deployment Methods	22
Supported Internet Browsers	22
CCKM Functionality	22
 Chapter 2: VM Specifications for CCKM Components	 24
With Local MongoDB bundled with CCKM Appliance (Recommended for PoCs Only)	24
PoC – Hardware Recommendation	24
Development/Staging – Hardware Recommendation	24
Production – Hardware Recommendation	24
With External MongoDB (Recommended for Production)	24
PoC – Hardware Recommendation	25
Development/Staging – Hardware Recommendation	25
Production – Hardware Recommendation	25
With MongoDB Atlas (Recommended for Production)	26
PoC – Hardware Recommendation	26
Development/Staging – Hardware Recommendation	26
Production – Hardware Recommendation	26
 Chapter 3: About CCKM Admin and User Portals	 27
CCKM Administration Privileges	27
Accessing CCKM Admin Portal (as CCKM Admin)	28
Accessing CCKM User Portal from CCKM Admin Portal	28
Accessing CCKM User Portal (as CCKM User)	31
Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI	32
Accessing the Multi-account Login/Logout Window	32

Switching to Another User Account (Already Logged On)	32
Logging on to Another User Account	33
Logging Out of a User Account	33
Logging Out of All User Accounts from a Specific Cloud Service or All Cloud Services	33
User Handling within CCKM User Portal (User Login Info)	33
User Authentication	33
User Authorization	34
User Audit	34

Chapter 4: How It Works: Installation and Configuration Flow 35

Step 1: Install and Configure MongoDB	35
Step 2: Install and Configure Key Source	35
Install and Configure CipherTrust Manager as your Key Source	35
Install and Configure DSM as your Key Source	36
Install and Configure nShield as your Key Source	36
Step 3: Setup to Connect to Cloud(s)	36
Connect to Azure	36
Connect to AWS	36
Connect to Google Cloud	37
Connect to IBM Cloud	37
Connect to Salesforce	37
Step 4: Install CCKM in One of the Supported Deployment Methods	37
Step 5: Perform Required Steps for the Initial Configurations of CCKM Admin Portal	37

Chapter 5: Set Up MongoDB 38

Scenario 1: Use Built-in MongoDB for Evaluation and PoC Purposes	38
Scenario 2: Configure an Existing (External) MongoDB (Single Node or Replica Set)	38
(Optional) Enable TLS	38
Create a Database (kmaas) and User (kmaas_user)	39
Scenario 3: Configure MongoDB Atlas	39
Whitelist Devices Allowed to Connect to MongoDB Atlas	39
(Optional) Add MongoDB (Custom) Role (kmaas_role)	40
Add MongoDB User (kmaas_user)	40
Create a New Cluster	41
Obtain Connection String for Connection Using a MongoDB Driver	41

Chapter 6: Install and Configure Key Source 42

Install and Configure CipherTrust Manager as Key Source	42
Install and Configure DSM as Key Source	43

Install and Configure nShield Connect as Key Source	43
Chapter 7: Register CCKM App in Azure Cloud	45
Registering CCKM App in Azure or Azure China Cloud	45
Create an Azure Active Directory Application (Multi-tenanted) in Azure Portal	45
Set Required Permissions on CCKM App	46
Assign Azure Contributor Role to CCKM App as Service Principal	47
Create a Key in Azure Portal	47
Chapter 8: Setting Up CCKM App for Access to Google Cloud	48
Set Up OAuth Consent Screen and Request Verification	48
Enable Identity and Access Management API	49
Enable Cloud Resource Manager API	49
Enable Cloud Key Management Service (KMS) API	49
Create OAuth2 Client ID Credentials	50
Set Session Duration for Google Cloud Console	50
Create Service Account	51
Grant IAM Roles to User and Service Accounts	52
Grant Project Browser and Cloud KMS Admin Roles	52
Grant Organization Viewer Role	52
Create Custom Roles	53
Chapter 9: Create a Connected CCKM App in Salesforce	54
Creating a Connected CCKM App in Salesforce	54
Editing CCKM App to Update OAuth Policies	55
Chapter 10: Install CCKM	57
Install on VMware ESXi Server	58
Install on AWS	59
Start the Installation	59
Configure Instance Details	59
Complete the Installation	60
Install on Microsoft Hyper-V	61
Create CCKM VM	61
Power on CCKM VM and Connect to It	61
Launch on Azure Marketplace	61
Use SSH to Change the Default Password on the CCKM VM	61
Synchronize CCKM Local time with Network Time using NTP Server	62
Configure Multiple NICs on CCKM Instance	63

Configure Network Interface	63
Add New Routes to Routing Table	64
Access the CCKM GUI	64
CCKM Cluster Configuration	65
Chapter 11: Initial Configurations within CCKM Admin Portal	66
Summary of Initial Configuration Steps	66
Change Default Admin Portal Password (During First-time Login)	67
Login into Admin Portal	67
Set Up Database	67
Upload License	67
Configure Key Source	68
Add Cloud	68
Chapter 12: About the Admin Portal	69
CCKM Admin Portal	69
Manage Clouds	70
Add Cloud	70
Step 1: Add Cloud	70
Set Access to Cloud	71
Set Access to AWS Cloud	71
Set Access to Azure (Azure, Azure China) Cloud	71
Set Access to Google Cloud	72
Set Access to IBM Cloud	72
Set Access to Salesforce Cloud	72
Set Access to Salesforce Government Cloud	73
Set Access to Salesforce Sandbox Cloud	73
Configure Key Source	73
Configure CipherTrust Manager as Key Source	74
Prerequisites	74
Configuring CipherTrust Manager	74
Configure DSM as Key Source	75
Prerequisites	75
Configuring DSM	75
Configure nShield Connect (for Azure and AWS Clouds)	75
Prerequisites	76
Configuring nShield	76
Review Logs	77
Review Health Monitor	77

Review Licenses	79
Settings	80
Configure Database	80
Configure Local Database	81
Configure Remote Database	81
Configure ReplicaSet Database	82
Configure MongoDB Atlas	82
Set Proxy Settings	83
Set SMTP Settings	83
Set Debug Log Level	84
Configure User Portal Preferences	84
Manage Deletion of Source Keys	84
Manage Masking of Email Addresses	85
Manage Users	85
Add User	85
Disable User	86
Enable User	86
Delete User	86
Reset Password	87
Update Admin Password Security	87
Chapter 13: CCKM for AWS Key Management	89
Overview	89
Prerequisites on AWS	90
Access AWS Key Management	91
Access CCKM for AWS	91
AWS CCKM User Portal	91
Home	93
Keys	93
Create a Key	96
Create a Native Key	96
Upload your Own Key (BYOK)	98
Delete a Key	98
Delete a BYOK	99
Schedule Delete	99
Schedule Delete Key	99
Import a Key	99
Update Key	100
Download Public Key (Asymmetric Key Only)	100
Rotate Key	100

Manually Rotate a Key (Symmetric Key)	101
Enable Autorotation of Key (Symmetric Key)	102
Manually Rotate a Key (Asymmetric Key, Encrypt, and Decrypt)	102
Manually Rotate a Key (Asymmetric Key, Sign, and Verify)	103
Enable Autorotation of Key (Asymmetric Key, Encrypt, and Decrypt)	103
Enable Autorotation of Key (Asymmetric Key, Sign, and Verify)	104
Synchronize Keys	104
Enable Autorotation before Key Expiration	105
Export Keys	105
Reports	106
Configure CloudTrail and CloudWatch in AWS to Use CCKM Reports	106
Overview	106
Configure CloudTrail	107
Configure CloudWatch Log Group	107
Schedules	107
Schedule Key Rotation	107
Set up a Key Rotation Schedule	108
Pause a Key Rotation Schedule	108
Delete a Key Rotation Schedule	108
Schedule Key Synchronization	108
Set up a Key Synchronization Schedule	109
Schedule Key Expiration	110
Set up a Key Expiration Schedule	110
Logs	110
Key Sources	111
Add (Generate) a Key	111
Add (Generate) a CipherTrust Manager Key	111
Add (Generate) a DSM Key	112
Add (Generate) an nShield Key	112
Delete a Key	112
Manage keys in Key Sources List Page	112
Settings	113
Adding Recipients' Email Addresses (for Notifications)	113
Enabling Notifications	113
Enabling Reporting for AWS Keys	113
Enabling Reporting for AWS Keys Using an Existing CloudTrail and CloudWatch Log Group ..	114
Enabling Reporting for AWS Keys Using a New CloudTrail and CloudWatch Log Group	114
Configuring Syslog Server	115
Configure Remote Syslog Server	115
Delete Remote Syslog Server Configuration	116

About	116
Chapter 14: CCKM for Azure Key Management	117
Overview	117
Accessing and Managing Azure Resources	117
Registering Apps in Azure	118
Prerequisites on Azure	118
Access CCKM for Azure	118
Accessing CCKM for Azure Using User Login	119
Accessing CCKM for Azure Using Service Principal	119
Granting Admin Consent First Time Accessing CCKM for Azure Using Service Principal	119
Accessing CCKM for Azure Using Service Principal (After Granting Admin Consent)	120
Azure CCKM User Portal	120
Home	122
Azure Directory Context Switcher (Support for Guest User for AAD B2B Collaboration)	122
Accessing the CCKM Directory Context Switcher Window	123
Logging Out of User Directory	123
Switching to Another User Directory	123
Logging Out of All User Directories	123
Keys	124
Create a Key	126
Upload your Own Key (BYOK)	126
Create a Native Key	128
Delete a Key	129
Restore a Key	129
Delete a “Soft-deleted” Key	129
Recover a “Soft-delete” Key (to Azure)	130
Purge a “Soft-delete” Key	130
Restore a “Soft-delete” Key (to Azure)	131
Rotate a Key	131
Manually Rotate a Key (Add a New Version of a Key)	132
Enable Autorotation of Key	133
Synchronize Keys	134
Enable Autorotation before Key Expiration	134
Export Keys	135
Backup Key	135
Delete a Backup Key	136
Reports	136
Schedules	137
Schedule Key Rotation	137

Set up a Key Rotation Schedule	137
Pause a Key Rotation Schedule	138
Delete a Key Rotation Schedule	138
Schedule Key Synchronization	138
Set up a Key Synchronization Schedule	139
Schedule Key Expiration	139
Set up a Key Expiration Schedule	140
Logs	140
Key Sources	141
Add (Generate) a Key	141
Add (Generate) a CipherTrust Manager Key	141
Add (Generate) a DSM Key	142
Add (Generate) an nShield Key	142
Delete a Key	143
Manage Keys in Key Sources List Page	143
Settings	143
Adding Recipients' Email Addresses (for Notifications)	143
Enabling Notifications	143
Configuring Syslog Server	144
Configure Remote Syslog Server	144
Delete Remote Syslog Server Configuration	145
Configuring Tenant Password and Revoking Admin Consent (for Service Principal)	145
Change Tenant Password	146
Revoke Admin Consent	146
About	146
Chapter 15: CCKM for Google Key Management	147
Overview	147
Google Cloud IAM	147
Member	147
Roles	148
Resource	149
About Google Cloud Keys	150
Prerequisites on Google Cloud	151
Access CCKM for Google Key Management	152
Google CCKM User Portal	152
Home	154
Keys	154
Create a Key	157
Create a Native Key	158

Upload your Own Key (BYOK)	159
Update Key	162
Update Key (Asymmetric Key)	162
Update Key (Symmetric Key)	163
Rotate a Key	163
Manually Rotate a Key (Symmetric Key)	164
Enable Autorotation of Key (Symmetric Key)	164
Manually Rotate a Key (Add New Key Version) (Asymmetric Key)	165
Enable Autorotation of Key (Add New Key Version) (Asymmetric Key)	166
View All Key Versions	167
Synchronize Keys	167
Disable or Enable Key Version	168
Disable Key Version	168
Enable Key Version	169
Schedule (or Cancel) Destruction of Key Version or All Key Versions	169
Schedule Destruction of Key Version	170
Schedule Destruction of All Key Versions	170
Cancel Schedule Destruction of Key Version	171
Cancel Schedule Destruction of All Key Versions	171
Download Public Key (Asymmetric Key Only)	171
Export Keys	171
Reports	172
Generate a Report	173
Delete a Report	173
Schedules	173
Schedule Key Rotation	174
Set up a Key Rotation Schedule	174
Pause a Key Rotation Schedule	175
Delete a Key Rotation Schedule	175
Schedule Key Synchronization	175
Set up a Key Synchronization Schedule	175
Logs	175
Key Sources	176
Add (Generate) a Key	176
Add (Generate) a CipherTrust Manager Key	176
Add (Generate) a DSM Key	177
Add (Generate) an nShield Key	177
Delete a Key	177
Manage Keys in Key Sources List Page	177
Settings	178

Adding Recipients' Email Addresses (for Notifications)	178
Enabling Notifications	178
Configuring Syslog Server	179
Configure Remote Syslog Server	179
Delete Remote Syslog Server Configuration	180
Adding Google Cloud Service Account to CCKM	180
Add Service Account	180
Update Service Account	181
Delete Service Account	181
About	181
 Chapter 16: CCKM for IBM Key Management	182
Overview	182
Types of Encryption Keys Supported within IBM HPCS and Key Protect	182

Preface

This guide describes how to deploy the CipherTrust Cloud Key Manager (CCKM), and how to configure it to connect with various data sources and clouds. It also describes how to use the CCKM web interface.

Intended audience

This guide is for the system administrator who will install and configure the CCKM. This role is the "CCKM Admin". This guide describes how to use the CCKM GUI for managing AWS, Azure, Azure China, Google Cloud, IBM, Salesforce, Salesforce Government Cloud, and Salesforce Sandbox keys. These users, who must have access credentials to their organizations' cloud accounts, are referred to as "Cloud administrators."

Note

In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

Document Conventions

The document conventions describe common typographical conventions and important notice and warning formats used in Thales technical publications.

Typographical Conventions

This section lists the common typographical conventions for Thales technical publications.

Table 3-1: Typographical Conventions

Convention	Usage	Example
bold regular font	GUI labels and options	Click the System tab and select General Preferences .
<i>bold italic monospaced font</i>	Variables or text to be replaced	https://< <i>Token Server name</i> >/admin/ Enter password: < <i>Password</i> >
<i>regular monospaced font</i>	- Commands and code examples - XML examples	<code>session start iptarget=192.168.253.102</code>
<i>italic regular font</i>	GUI dialog box titles	The <i>General Preferences</i> window opens.
	File names, paths, and directories	<i>/usr/bin/</i>
	Emphasis	<i>Do not</i> resize the page.
	New terminology	<i>Key Management Interoperability Protocol (KMIP)</i>
	Document titles	See <i>CipherTrust Cloud Key Manager Installation & Configuration Guide</i> for information about .
quotes	- File extensions - Attribute values - Terms used in special senses	<code>.js</code> , <code>.ext</code> <code>"true"</code> <code>"false"</code> , <code>"0"</code> <code>"1+1"</code> hot standby failover

Notes, Tips, Cautions, and Warnings

Notes, tips, cautions, and warning statements may be used in this document.

A Note provides guidance or a recommendation, emphasizes important information, or provides a reference to related information. For example:

Note

It is recommended to keep tokenization keys separate from the other encryption/decryption keys.

A tip is used to highlight information that helps you complete a task more efficiently, such as a best practice or an alternate method of performing the task.

Tip

You can also use Ctrl+C to copy and Ctrl+P to paste.

Caution statements are used to alert you to important information that may help prevent unexpected results or data loss. For example:

CAUTION

Make a note of this passphrase. If you lose it, the card will be unusable.

A warning statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data. For example:

WARNING

Do not delete keys without first backing them up. All data that has been encrypted with deleted keys cannot be restored or accessed once the keys are gone.

Hardware-Related Warnings

The following warning statement is used to indicate the risk of electrostatic discharge of equipment:

ELECTROSTATIC DISCHARGE

If this warning label is affixed to any part of the equipment, it indicates the risk of electrostatic damage to the module. To prevent equipment damage, follow suitable grounding techniques.

The following warning statement is used to indicate the risk of hazardous voltages of equipment:

HAZARDOUS VOLTAGES

The warnings in this section indicate voltages that could cause serious danger to personnel.

Sales and Support

If you encounter a problem while installing, registering, or operating this product, please refer to the documentation before contacting support. If you cannot resolve the issue, contact your supplier or Thales Customer Support.

Thales Customer Support operates 24 hours a day, 7 days a week. Your level of access to this service is governed by the support plan arrangements made between Thales and your organization. Please consult this support plan for further information about your entitlements, including the hours when telephone support is available to you.

For support and troubleshooting issues:

- <https://supportportal.thalesgroup.com>
- (800) 545-6608

For Thales Sales:

- <https://cpl.thalesgroup.com/encryption/contact-us>
- CPL_Sales_AMS_TG@thalesgroup.com
- (888) 267-3732

Chapter 1: Overview

CCKM Components	20
CCKM Functionality	22

The CipherTrust Cloud Key Manager (CCKM) centralizes the management of the life cycle of cloud keys in multi-cloud, hybrid, and enterprise environments. CCKM addresses the needs of these environments for encrypting data in the cloud while retaining custodianship of encryption keys to comply with data security mandates in cloud storage environments. For the clouds (or cloud services) CCKM supports, CCKM enables enterprises who use these services to bring their own keys to those clouds, back up keys on premise, destroy cloud keys in specific situations, and manage the life cycle of cloud keys. CCKM provides a web GUI for all functions.

Note

In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

CCKM Components

The CCKM solution comprises of the following components (see [Figure 1-1: "CCKM Solution: CCKM and Components" below](#)):

- CCKM with Web UI pages including an administrator portal (for CCKM administrators) and a user portal (for cloud administrators or cloud key administrative users)
- At least one of the supported clouds (you can use all clouds)
- A supported trusted key source
- MongoDB, MongoDB Atlas, or Percona Server for MongoDB as a database
- A supported Internet browser

Figure 1-1: CCKM Solution: CCKM and Components

The product is delivered as a virtual appliance that can be installed on any one of the supported deployment methods.

Supported Clouds

CCKM supports the following clouds:

- Amazon Web Services (AWS)
- Google Cloud
- IBM
- Microsoft Azure (Azure and Azure China)
- Salesforce (Salesforce, Salesforce Government Cloud, and Salesforce Sandbox)

Supported Key Sources

CCKM uses trusted key sources for the encryption keys employed within the supported clouds. Certain trusted key sources also store the clouds' backup keys. Currently, the supported key sources include:

- Vormetric Data Security Manager (DSM): The DSM supports all of the clouds that CCKM supports. The DSM keys and the backup keys from the supported clouds are stored in DSM.
- CipherTrust Manager: CipherTrust Manager supports all clouds that CCKM supports. The CipherTrust Manager keys and the backup keys from the supported clouds are stored in CipherTrust Manager.

Note

SafeNet Next Generation KeySecure has been rebranded as CipherTrust Manager. Throughout this guide, CipherTrust Manager is employed to reflect the new name of this product.

- nShield Connect hardware security module (HSM): nShield Connect supports the AWS and Azure clouds. The nShield Connect keys and the backup keys from the clouds are stored in MongoDB, the supported CCKM database.

Note

Concurrent use of the CipherTrust Manager, DSM, and nShield as key sources is not supported. Configure only **one** of these supported key sources as a key source.

Supported Databases

CCKM supports MongoDB, MongoDB Atlas, and Percona Server for MongoDB, a global cloud database service, to store key metadata, and CCKM system and user configuration information. Encrypted communication using TLS between CCKM and MongoDB (MongoDB, MongoDB Atlas, or Percona Server for MongoDB) is available. Furthermore, CCKM supports MongoDB Atlas on Google Cloud, as well as on Microsoft Azure.

Notes

- Any general references made to “MongoDB” in this guide applies to any one of the supported MongoDBs (MongoDB, MongoDB Atlas, or Percona Server for MongoDB) unless otherwise noted.
- Configure only **one** of the supported MongoDB databases.
- For the supported versions of MongoDB, MongoDB Atlas, and Percona Server for MongoDB, see [Chapter 4: "How It Works: Installation and Configuration Flow" on page 35](#).
- The MongoDB installation file includes a community (free) edition of MongoDB that can be used for evaluation and proof-of-concept (PoC) purposes. For a production setup, an external MongoDB in replica set configuration or a MongoDB Atlas configuration is recommended.

Supported Deployment Methods

CCKM is delivered as a virtual appliance that can be installed in one of the following methods:

- On-premises by deploying an .ova file
- In Amazon Web Services by deploying an Amazon Machine Image (AMI)
- By instantiating CCKM from the Azure Market place by deploying a Virtual Hard Disk (VHD) image
- In a Microsoft Hyper-V environment by deploying a VHD image

Supported Internet Browsers

The CCKM supports the following Internet browsers:

- Chrome 51.0.2704 (64-bit) or later
- Firefox 45.0 or later
- Internet Explorer 11 or later
- Microsoft Edge 89.0.774.45 or later

CCKM Functionality

CCKM offers similar functionality for each of the supported clouds within the supported deployment scenarios:

- **Life cycle management** of keys, key versions, and attributes:
 - View Keys
 - Update Keys
 - Upload Keys
 - Rotate Keys
 - Delete Keys
- **Disaster recovery** of keys
 - Backup Keys
 - Restore Keys
- **Hybrid key management**
 - On-premise Keys storage
 - Management of both keys originating from trusted key sources and cloud-provider-sourced keys
 - Key synchronization

- **Compliance Management**

- Key storage within on premise FIPS 140-2 Level 3 certification
- Key storage in public or private clouds, inaccessible to clouds with FIPS 140-2 Level 1

- **Certificate handling (Salesforce)**

- View certificates
- Synchronize certificates
- Use certificates to wrap keys for secure key upload

- **Key visibility reporting**

- Combined Key Activity Reconciliation Report
Track and reconcile key activities between CCKM and a cloud
- Key Activity Report
Insight into who, what and when keys were accessed, created, deleted across PaaS
- Key Aging Report
Insight into who owns the keys and when keys expire
- Key Service Usage Report
Insight into applications consuming the keys across IaaS/PaaS/SaaS

Note: This report is not available for Salesforce, Salesforce Government, and Salesforce Sandbox.

- Cloud Key Manager User Action Report
Insight into aggregated user activities, such as delete or create keys
- Connection to a remote syslog server for forwarding of CCKM activity logging. Syslog messages may also be directed to a SIEM system that accepts syslog messages. Syslog messages may also be directed to a Splunk server.

Chapter 2: VM Specifications for CCKM Components

- With Local MongoDB bundled with CCKM Appliance (Recommended for PoCs Only) 24
- With External MongoDB (Recommended for Production) 24
- With MongoDB Atlas (Recommended for Production) 26

This chapter provides the minimum requirements for the CCKM and MongoDB virtual machines (VMs) when CCKM is running bundled with a local MongoDB, with external MongoDB node(s), or MongoDB Atlas.

With Local MongoDB bundled with CCKM Appliance (Recommended for PoCs Only)

PoC – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 4 GB Memory
- 100 GB Hard disk (Thin)

Development/Staging – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 4 GB Memory
- 100 GB Hard disk (Thin)

Production – Hardware Recommendation

CCKM VM minimum requirements:

- 4 CPUs
- 8 GB Memory (Use 16 GB if API driven high frequency workflows are needed)
- 250 GB Hard disk (Thin)

With External MongoDB (Recommended for Production)

Note

If you are using Percona Server for MongoDB (single node or replica set), this section applies to you.

PoC – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 4 GB Memory (Use 8 GB if API driven high frequency workflows are needed to be tested)
- 100 GB Hard disk (Thin)

MongoDB VM minimum requirements:

- 2 CPUs
- 4 GB Memory (Use 8 GB if API driven high frequency workflows are needed to be tested)
- 250 GB Hard disk (Thin)

Development/Staging – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 4 GB Memory (Use 8 GB if API driven high frequency workflows are needed to be tested)
- 100 GB Hard disk (Thin)

MongoDB VM minimum requirements:

- 2 CPUs
- 4 GB Memory (Use 8 GB if API driven high frequency workflows are needed to be tested)
- 250 GB Hard disk (Thin)

Production – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 8 GB Memory (Use 16 GB, if API driven high frequency workflows are needed)
- 100 GB Hard disk (Thin)

External MongoDB VM minimum requirements for each node:

- 4 CPUs
- 8 GB Memory (Use 16 GB, if API driven high frequency workflows are needed)
- 250 GB Hard disk (Thin)

With MongoDB Atlas (Recommended for Production)

PoC – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 4 GB Memory
- 100 GB Hard disk (Thin)

Development/Staging – Hardware Recommendation

CCKM VM minimum requirements:

- 2 CPUs
- 4 GB Memory
- 100 GB Hard disk (Thin)

Production – Hardware Recommendation

CCKM VM minimum requirements:

- 4 CPUs
- 8 GB Memory (Use 16 GB if API driven high frequency workflows are needed)
- 250 GB Hard disk (Thin)

Chapter 3: About CCKM Admin and User Portals

- CCKM Administration Privileges 27
- Accessing CCKM Admin Portal (as CCKM Admin) 28
- Accessing CCKM User Portal from CCKM Admin Portal 28
- Accessing CCKM User Portal (as CCKM User) 31
- Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI 32
- User Handling within CCKM User Portal (User Login Info) 33

CCKM provides Web UI pages for a CCKM Admin Portal for CCKM administrators and a CCKM User Portal for CCKM users (also known as cloud administrators). The chapter provides information about these portals, administration privileges, support for multi-accounts per cloud, and the handling of user (cloud administrator) login.

For information about the available menu options used to configure and manage the CCKM from the CCKM Admin Portal and, see [Chapter 12: "About the Admin Portal" on page 69](#).

Note
In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

CCKM Administration Privileges

From the CCKM Admin Portal, a CCKM administrator can add and configure clouds, monitor CCKM logs to review user activities in CCKM, upload your CCKM license(s) and view all of the licenses for the configured clouds, and manage and configure CCKM settings. Unless the CCKM administrator also has user (cloud administrator) login credentials for Azure, AWS Key Management, Google Cloud, IBM or Salesforce, he or she will not be able to access the CCKM User Portal pages.

To access the CCKM User Portal, a CCKM user must have valid login credentials for the organization's designated clouds. No specific "CCKM administrator" is created. Administrators have access from the CCKM User Portal to all clouds for which they have *valid* credentials.

Accessing CCKM Admin Portal (as CCKM Admin)

1. Enter “https://<IP address of CCKM instance>” in a browser. The CCKM Admin Login page is displayed:

2. Log in as a CCKM administrator using your administrator credentials. The CCKM Admin Portal is displayed:

Accessing CCKM User Portal from CCKM Admin Portal

From the CCKM Admin Portal, you can access the CCKM User Portal and CCKM Home page. However, you are required to enter the user login credentials for the given Key Management service to access the CCKM User Portal.

From the CCKM Admin Portal, select a *configured* cloud from the Key Management drop-down list at the top of the page.

Note

Only the cloud(s) you have configured display in the **Key Management** drop-down list.

The login page for the selected Key Management service is displayed.

Azure

The Microsoft login page opens at <https://login.microsoftonline.com/>

Enter your Microsoft user login credentials or click on the saved user name. The Microsoft Login page is displayed. Enter your Microsoft password and click **Log In**.

AWS

If you select **AWS** as the Key Management service, then the CCKM user login page is displayed. From this page, select the AWS key management service and the login page for AWS displays. Click **Log into AWS**. The AWS Password Login page is displayed. Enter your AWS key credentials in the **AWS Access Key ID** and **AWS Secret Access Key** boxes and click **Log In**.

Google

If you select **Google** as the Key Management service, then the CCKM user login page is displayed. From this page, select the Google key management service. You are redirected to <https://accounts.google.com/>. Enter your Google user login credentials (or click on the saved user name) and then enter your Google password. Click **Log In**. At the consent page, click **Allow** to proceed with the login.

IBM

If you select **IBM** as the Key Management service, then the CCKM user login page is displayed. From this page, select the IBM key management service and the login page for IBM displays. Click **Log into IBM**. The IBM Password Login page is displayed. Under **Login Type**, select **User Name** or **Service ID** depending on which type of login you wish to use. Under **Network Endpoint Mode**, select **Public** or **Private** depending on whether you wish to use a public or a private endpoint to access the IBM cloud services (HPCS or Key Protect) from CCKM. Enter your IBM key credentials in the **IBM Cloud User Name** and **IBM Cloud API Key** boxes and click **Log In**. If you selected **User Name** as the login type, enter your IBM username and IBM Cloud API key for your IBM key credentials. If you selected **Service ID** as the login type, enter your IBM service ID and IBM service ID API Key. You can also upload your IBM key credentials file under the **Load Credentials from IBM credentials file** by choosing the file and then clicking **Log In**.

Salesforce

The Salesforce login page opens at <https://login.salesforce.com/>.

The Salesforce Government login page URL is unique. This login page opens at:

https://{Salesforce_Government_My_Domain_URL} where "Salesforce_Government_My_Domain_URL" is your unique URL.

The Salesforce Sandbox login page opens at <https://test.salesforce.com/>

Enter your Salesforce credentials or click on the saved user name. The Salesforce login page is displayed. Enter your Salesforce password and click **Log In**.

Note

The first time you access the CCKM, the keys are synchronized and a progress page is displayed. Once synchronization is complete, click **Continue**. The **CCKM Home** page is displayed within the CCKM User Portal.

Accessing CCKM User Portal (as CCKM User)

To access the CCKM User Portal and CCKM Home page as a CCKM user:

1. Enter “https://<CCKM IP address>:8443/kmaas” in a browser. The CCKM user login page is displayed.

2. Select the installed Key Management service you wish to use. The login page for the selected Key Management service is displayed.
3. Enter your user login credentials for the given Key Management service to log into CCKM. The **CCKM Home** page is displayed within the CCKM User Portal.

Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI

CCKM supports login and key management for multiple accounts or multiple users per cloud through a single CCKM UI (Multi-account Login/Logout) and browser window.

Note

CCKM does not currently support login and key management for multiple accounts or multiple users per cloud for the Salesforce Government cloud.

The following **Multi-account Login/Logout** window reflects the Azure account (varies depending on the cloud account into which you are currently logged):

User name	Switch to	User Logout
[redacted]@azurevormetric.onmicrosoft.com	☐	☐
[redacted]@azurevormetric.onmicrosoft.com	☐	☐

Show 10 entries « 1 » Showing 1 to 2 of 2

Cancel Add Tenant Logout of Azure Logout All Services

You can perform the following using the **Multi-account Login/Logout** window.

- Logon to multiple accounts for a specific cloud (AWS/Azure/Google/IBM/Salesforce)
- Logout of specific or all accounts within one cloud or all clouds
- Perform key management for multiple accounts from your current CCKM browser window

Accessing the Multi-account Login/Logout Window

To access the **Multi-account Login/Logout** window for a specific cloud, you must have at least one user already logged on to an account. Once you are logged onto an account, from the service **Dashboard**, click on the cloud icon (Context Switcher) at the top of right of the page. The **Multi-account Login/Logout** window displays. The following sections provide instructions on how to use this window.

Switching to Another User Account (Already Logged On)

(Applicable for a given cloud on to which you are currently logged) To access another user account, which is already logged on, select the **Switch** to button next to the user name (account) for which to log on. You are then switched to that account with the user name displayed at the top of the **CCKM Home** page.

Logging on to Another User Account

(Applicable for a given cloud on to which you are currently logged) To log on to another user account, click one of following buttons depending on the service you are currently logged and then enter the user credentials in the login dialog boxes of the cloud:

- **Add Tenant** (applicable to Azure, and Azure China)
- **Add Organization** (applicable to Google Cloud)
- **Add OrgID** (applicable to Salesforce and Salesforce Sandbox)
- **Add Account** (applicable to AWS and IBM)

Once the user authentication is completed, you are logged on to the given user account and the username is displayed at the top of the CCKM Home page.

Logging Out of a User Account

(Applicable for a given cloud on to which you are currently logged) To logout of a specific user account, select the **User Logout** button next to the user name (account) for which to log out. The account is then logged out.

Logging Out of All User Accounts from a Specific Cloud Service or All Cloud Services

To logout of all of the user accounts for a specific cloud, click one of the following depending on the service to which you are currently logged:

- **Logout of Azure (or Logout of Azure China)**
- **Logout of AWS**
- **Logout of Google**
- **Logout of IBM**
- **Logout of Salesforce (Logout of Salesforce Sandbox)**

To logout of all clouds, click the **Logout All Services** button. All services are then logged out.

User Handling within CCKM User Portal (User Login Info)

This section describes how CCKM handles user authentication, user authorization, and user audits within the CCKM User Portal for each the clouds.

User Authentication

For AWS users, the user provides their AWS long-term credentials (for example, access key ID and secret access key) to CCKM. CCKM uses these credentials to obtain a one-time, temporary credential for the user session. *CCKM does not save a user's long-term credentials.*

For Azure, Google Cloud, and Salesforce users, the CCKM itself does not maintain user credentials. It uses OAuth2 to authenticate users.

During login, users are redirected to the Azure, Google Cloud, or Salesforce login page (depending on the cloud you accessing) to enter their respective username/password combinations. Once authenticated, the CCKM User Portal

obtains an OAuth2 access token from the cloud and then maintains a user session between CCKM and the user's browser. While the user session is active, CCKM uses the access token to call the given cloud's REST APIs, and will allow the logged-in user to access and manage keys within the given cloud per the granted permission.

For IBM users, the user provides their IBM long-term credentials (for example, IBM Username and API Key) to CCKM. CCKM uses these credentials to obtain a one-time, temporary credential for the user session. CCKM does not save a user's long-term credentials.

User Authorization

In AWS, user authorization defines what a user can do with AWS KMS. For a user to manage AWS CMKs, he or she must have proper KMS permissions. In addition, to use CCKM, the user should have IAM GetUser permission.

In Azure, user authorization defines what a user can do on Azure keys. For example, whether they can view, upload, update, delete, or restore keys in a key vault. This is managed within Azure Key Vault's Access Control (IAM) and Access Policies. To allow a user to manage keys in a key vault, the key vault owner must give the user "Key Vault Contributor" role in Access Control, and appropriate permissions as needed on keys in **Access Policies**. If CCKM is used as a service principal, then select Azure role-based access control permission model.

In Google Cloud, user authorization defines what a user can do on Google Cloud keys. For example, whether they can view, upload, update, rotate, or schedule destroy keys in Google Cloud KMS. This is managed within Google Cloud's Identity and Access Management (IAM). You will need to have at least the Viewer role on the Key Rings that you wish to manage and the appropriate permissions as needed on the keys and key versions. For more information, see [Chapter 15: "CCKM for Google Key Management" on page 147](#).

In IBM, user authorization defines what a user can do within IBM Cloud HPCS and IBM Key Protect. For a user to manage an IBM HPCS or Key Protect instance, he or she must have proper permissions for these two supported IBM key management services. In addition, to use CCKM, the user should have IAM GetUser permission and keys level permission.

In Salesforce, user authorization defines whether the user has "Manage Encryption Keys" permission or not. Only users who have **Manage Encryption Keys** permission can manage Tenant Secrets.

User Audit

User operations (within the CCKM User Portal), including login and logout (successful or failed) are captured in CCKM audit logs. Currently, there are no access policies on CCKM audit logs and so any logged-in user for a specific organization and service can view all audit logs. These audit logs include operations made by other users in the past, within the scope of that organization.

Chapter 4: How It Works: Installation and Configuration Flow

Step 1: Install and Configure MongoDB	35
Step 2: Install and Configure Key Source	35
Step 3: Setup to Connect to Cloud(s)	36
Step 4: Install CCKM in One of the Supported Deployment Methods	37
Step 5: Perform Required Steps for the Initial Configurations of CCKM Admin Portal	37

This chapter provides a summary of the steps to take to install and configure the CCKM solution (CCKM and its components). Use the steps in this section to guide you in installing and configuring the CCKM solution. Refer to the related sections for details about a given step.

Note

In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

Step 1: Install and Configure MongoDB

Choose **one** of the following and perform the pre-setup steps within MongoDB:

- **Embedded (free) MongoDB** No pre-setup required
- **External MongoDB (single or replica)**
Supported versions are 4.4.6 and later.

Note: This version of CCKM was tested with versions 4.4.6 and 5.0.3 of MongoDB.

- **MongoDB Atlas Supported versions are 4.4.12 and 5.0.6.**
- **Percona Server for MongoDB (single or replica) Supported version is 4.2.8-8**

Note

CCKM communicates with MongoDB through port 27017.

For more information, see [Chapter 5: "Set Up MongoDB" on page 38](#).

Step 2: Install and Configure Key Source

Perform **one** of the following steps depending on which key source you are using.

Install and Configure CipherTrust Manager as your Key Source

If you plan to use the CipherTrust Manager as your key source, you must launch and configure it prior to configuring CCKM to integrate with the CipherTrust Manager. Use version 2.3.0 or later.

Note

By default, CCKM communicates with the CipherTrust Manager through port 443. You can change this setting for the port number of the CipherTrust Manager web interface. For more information, see ["Configure CipherTrust Manager as Key Source" on page 74](#).

Note

When using version **2.6.0** of CipherTrust Manager as a key source for CCKM version **1.10.0** and earlier versions, you are required to either upgrade CCKM to version **1.10.1** or change the CipherTrust Manager property of `ALLOW_UNKNOWN_FIELDS` to `true`. By default, this property is set to `false`.

For more information, see ["Install and Configure CipherTrust Manager as Key Source" on page 42](#).

Install and Configure DSM as your Key Source

If you plan to use the DSM as your key source, then you must install and configure it prior to configuring the CCKM to integrate with the DSM. Install version **6.4.3.17030** or later.

Note

CCKM version **1.10.0** supports IBM cloud key management with DSM **6.4.4** and above.

Note

CCKM communicates with the DSM through ports 443 and 8445.

For more information, see ["Install and Configure DSM as Key Source" on page 43](#).

Install and Configure nShield as your Key Source

If you plan to use nShield Connect as your key source, then you must install and configure it prior to configuring the CCKM to integrate with the nShield Connect.

nShield Connect supports the AWS and Azure (Azure and Azure China) clouds. Install version **12.40.2** or later of nShield Connect.

With the use of nShield Connect, the keys are stored as blobs within the MongoDB.

Note

CCKM communicates with nShield Connect through port 9004.

For more information, see ["Install and Configure nShield Connect as Key Source " on page 43](#).

Step 3: Setup to Connect to Cloud(s)

Perform one or more of the following steps depending on which cloud(s) you are using.

Connect to Azure

If using Azure, create an app as a doorway between CCKM and cloud(s).

For more information, see [Chapter 7: "Register CCKM App in Azure Cloud" on page 45](#).

Connect to AWS

If using AWS, there is no requirement to create an app in AWS to connect to CCKM. AWS users should have the following:

- Access key ID and secret access key
- IAM GetUser permission for self (you as a user)
- Proper KMS permissions

Connect to Google Cloud

If using Google Cloud, perform all of the prerequisites to set up to connect to CCKM.

For more information, see ["Prerequisites on Google Cloud" on page 151](#).

Connect to IBM Cloud

If using IBM Cloud, there is no requirement to create an app in IBM to connect to CCKM.

IBM Cloud users should have the following:

- IBM Username and API Key
- IAM GetUser permission for self (you as a user)
- Proper IBM Cloud Hyper Protect Crypto Services (HPCS) permissions, if you are using this IBM key management service.
- Proper IBM Key Protect permissions, if you are using this IBM key management service
- Proper IBM Cloud Activity Tracker and LogDNA permissions

Note

The port that CCKM uses to communicate with HPCS varies. To view the port number for a given HPCS instance, view the endpoint URL, which includes the port number, for the instance. Within the Navigation Menu of the IBM portal, select **Resource List**. Under **Resource list > Services and software**, select the HPCS instance for which to view the port number and select **Overview**. Under **Key management endpoint URL**, find the port number at the end of the URL.

Note

CCKM communicates with Key Protect through port 443.

For more information, see ["Prerequisites on IBM HPCS and Key Protect" on page 185](#).

Connect to Salesforce

If using Salesforce, Salesforce Government, or Salesforce Sandbox, create a connected app in Salesforce.

For more information, see [Chapter 9: "Create a Connected CCKM App in Salesforce" on page 54](#).

Step 4: Install CCKM in One of the Supported Deployment Methods

See [Chapter 10: "Install CCKM" on page 57](#) for more information.

Step 5: Perform Required Steps for the Initial Configurations of CCKM Admin Portal

See [Chapter 11: "Initial Configurations within CCKM Admin Portal " on page 66](#) for more information.

Chapter 5: Set Up MongoDB

Scenario 1: Use Built-in MongoDB for Evaluation and PoC Purposes	38
Scenario 2: Configure an Existing (External) MongoDB (Single Node or Replica Set)	38
Scenario 3: Configure MongoDB Atlas	39

The CCKM uses MongoDB to store key metadata, and CCKM system and user configuration information. The supported MongoDB configurations are described in this chapter.

Notes

- CCKM supports MongoDB, MongoDB Atlas, and Percona Server for MongoDB.
- Configure only **one** of the supported MongoDB databases.
- Be sure to back up your MongoDB database(s) on a regular basis. For more information on how to back up MongoDB, see ["Backup and Restore for MongoDB" on page 241](#).
- Although the CCKM includes a version of MongoDB, the software is supported by MongoDB. Contact the MongoDB Support team with any inquiries or issues.

Scenario 1: Use Built-in MongoDB for Evaluation and PoC Purposes

No pre-setup of MongoDB is required for the use of the built-in MongoDB within CCKM. If you are using the built-in MongoDB database server within CCKM (for evaluation and PoC purposes only), select to use the local database option from the **Database** tab within the **Settings** page of the CCKM Admin Portal.

Scenario 2: Configure an Existing (External) MongoDB (Single Node or Replica Set)

Note

If you are using Percona Server for MongoDB (single node or replica set), this section applies to you.

To configure an existing external MongoDB instance (single node or replica set):

- (Optional) Enable TLS for encrypted communication between MongoDB and CCKM
- (Required) Create one MongoDB database named *kmaas* and the user named *kmaas_user* along with the user passwords and database roles.

Each of these configurations is described in this section.

(Optional) Enable TLS

If you choose to enable TLS in the MongoDB server, add TLS-related parameters to the `mongod.conf` file. Here is a sample of the TLS-related parameters to add to the file:

```
tls:
  mode: requireTLS
  certificateKeyFile: /path to MongoDB .pem file
  FIPSMode: true
  disabledProtocols: TLS1_0,TLS1_1
```

```
security:
  keyFile: /path to keyFile for internal membership authentication
  authorization: enabled
```

For the MongoDB replica nodes, add these TLS-related parameters to each of the associated `mongod.conf` files.

Create a Database (*kmaas*) and User (*kmaas_user*)

Note

If the MongoDB server is TLS-enabled, then ensure that the MongoDB client has the root certificate authority file of MongoDB server as this file is required to perform the TLS handshake between the MongoDB server and CCKM.

In this section, create a database named *kmaas* and the MongoDB user of *kmaas_user* (along with the associated password and roles). CCKM uses the username and password to access the database.

To create a database and user:

1. Access the MongoDB server using the MongoDB client.
2. Create the *kmaas* database and a new user (*kmaas_user*) for this database by running the following commands (replacing `<mypassword>` with the password you choose):

```
use kmaas
db.createUser( { user: "kmaas_user", pwd: "<mypassword>", roles: [ "dbOwner" ] } )
```

Scenario 3: Configure MongoDB Atlas

Before configuring MongoDB Atlas within CCKM, configure MongoDB Atlas. Perform these configurations as described in this section:

- Whitelist Devices Allowed to Connect to MongoDB Atlas
- (Optional) Add MongoDB Role (*kmaas_role*)
- Add MongoDB User (*kmaas_user*)
- Create a New Cluster

If using a MongoDB Atlas cluster, you will also be required to obtain a connection string from MongoDB Atlas that is used to connect CCKM to your MongoDB Atlas cluster using a MongoDB driver.

The configuration steps in this section highlight the *optional* and *required* configurations for MongoDB Atlas to communicate with CCKM. It is assumed you are familiar with configuring MongoDB Atlas. For detailed information on how to configure these steps in MongoDB Atlas, refer to the MongoDB Atlas documentation.

Whitelist Devices Allowed to Connect to MongoDB Atlas

To whitelist the IP addresses of the devices allowed to connect to MongoDB Atlas:

1. In **SECURITY** in the left navigation bar, select **Network Access**.
2. Within **Network Access**, click **ADD IP ADDRESS** to add an IP address to the whitelist. The **Add Whitelist Entry** dialog box displays. In the **Whitelist Entry** box, enter the IP address.
3. Click **Confirm**.
4. Repeat steps 2 through 3 for each device to the whitelist.

(Optional) Add MongoDB (Custom) Role (kmaas_role)

Adding the customized MongoDB user role of `kmaas_role` to MongoDB Atlas is optional. When adding your MongoDB users to MongoDB Atlas, you can associate your MongoDB user to these custom roles. However, you can also associate the users with the pre-defined role of Read and write to any database. This role allows a user associated with this role to read and write to any database including the CCKM databases. If CCKM is the only application you are using with MongoDB Atlas, then assigning the Read and write to any database role to your users is sufficient. However, if you are using more than one application with MongoDB Atlas, then associating customized roles to your users is recommended.

To add the MongoDB user role of `kmaas_role` to MongoDB Atlas and associate actions and roles with a database:

1. In **SECURITY** in the left navigation bar, select **Database Access**.
2. In **MongoDB Roles**, click **ADD NEW CUSTOM ROLE**. The **Add Custom Role** dialog box displays.
3. In the **Custom Role Name** box, enter `kmaas_role`.
4. In the **Action** or **Role** box, select **Database Actions and Roles**.
5. In the **Database** box, enter `kmaas` as the name of the database to which to associate this role.
6. Click **Add Custom Role**.

Add MongoDB User (kmaas_user)

Perform one or the other of these configurations depending on which role you are assigning to your users.

To add the MongoDB user of `kmaas_user` to MongoDB Atlas and associate this user with the pre-defined role of **Read and write to any database**:

1. In **SECURITY** in the left navigation bar, select **Database Access**.
2. In **MongoDB Users**, click **ADD NEW USER**. The **Add New User** dialog box displays.
3. In the **Username** box, enter `kmaas_user`.
4. In the **Password** box, enter the password for the `kmaas_user` user.

Note: Ensure the password does not contain the escape character of “\”.

5. In **User Privileges**, click **Read and write to any database** to associate this user with this role.
6. Click **Add User**.

To add the MongoDB user of `kmaas_user` to MongoDB Atlas and associate this user with the customized role of `kmaas_role`:

1. In **SECURITY** in the left navigation bar, select **Database Access**.
2. In **MongoDB Users**, click **ADD NEW USER**. The **Add New User** dialog box displays.
3. In the **Username** box, enter `kmaas_user`.
4. In the **Password** box, enter the password for the `kmaas_user` user.
5. In **User Privileges**, click **Select Custom Role** and select `kmaas_role` to associate this user with this role.
6. Click **Add User**.

Create a New Cluster

In this step, you will create a new cluster in MongoDB Atlas for the CCKM application. Configuring a new cluster includes setting global cluster configuration, cloud provider and region, cluster tier, and cluster name.

After you create a new cluster for CCKM, one database set will be added to MongoDB Atlas. Thereafter, you are required to initialize the kmaas database by adding the (admin) user document to this database.

To create a new cluster in MongoDB Atlas for CCKM:

1. Under **ATLAS** in the left navigation bar, select **Clusters**.
2. In **Clusters**, click **Build a New Cluster**. The **Create a New Cluster** page displays.
3. In **Cloud Provider & Region**, select the provider and region you wish to use for the cluster.
4. In **Cluster Tier**, select the tier you wish to use for the cluster.
5. In **Additional Settings > for MongoDB 4.0, Backup > Select a Version**, select MongoDB 4.0.
6. (Optional. The display of this setting depends on your account settings.) In the **Turn on Backup (M2 and up)**, set this setting to **YES** and select **Continuous**.
7. In **More Configuration Options > Set Minimum TLS Protocol Version**, select TLS 1.2 and above.
8. Within **Cluster Name** box, enter the name of the new cluster.
9. Click **Create Cluster**.

Obtain Connection String for Connection Using a MongoDB Driver

In this step, you will obtain a connection string from MongoDB Atlas that is used to connect CCKM to your MongoDB Atlas cluster using a MongoDB driver. The connection string is made available to you based on the selected driver type and version. Copy this string and save it to a directory within your laptop or desktop. You will enter this connection string when configuring MongoDB Atlas settings in the Settings page > MongoDB tab of CCKM Admin Portal.

To obtain a collection string using a MongoDB driver:

1. In MongoDB Atlas, under **ATLAS** in the left navigation bar, select **Clusters**.
2. Find the cluster you created and click **Connect**.
3. In the **Choose a connection method**, select **Connect your application**.
4. In the **Choose your driver version**, select your driver and version from the dropdown menus.
 - a. Under **DRIVER**, select **Java**.
 - b. Under **VERSION**, select **4.3** or *later*.
5. In the **Add your connection string into your application code**, the **Connection String Only** tab displays the connection string to use to connect to your MongoDB Atlas cluster from CCKM. Click **Copy** to copy the connection string.
6. Save the connection string to a directory within your laptop or desktop.

Chapter 6: Install and Configure Key Source

Install and Configure CipherTrust Manager as Key Source	42
Install and Configure DSM as Key Source	43
Install and Configure nShield Connect as Key Source	43

This chapter provides information at a high-level about the installation and configuration of the key source you plan to use with the CCKM *prior* to installing and configuring CCKM. As part of these steps, you will *gather* information that is required to be entered in CCKM as part of the key source configuration. The following are the supported key sources:

- CipherTrust Manager
- DSM
- nShield Connect HSM

Note

Concurrent use of the CipherTrust Manager, DSM, and nShield as key sources is not supported. Configure only **one** of these supported key sources as a key source.

SafeNet Next Generation KeySecure has been rebranded as CipherTrust Manager. Throughout this guide, CipherTrust Manager is employed to reflect the new name of this product.

Install and Configure CipherTrust Manager as Key Source

Note

This documentation assumes that you are familiar with using the NextGen CipherTrust Manager. For information on how to launch and configure CipherTrust Manager, refer to the CipherTrust Manager Deployment Guide and CipherTrust Manager Administrator Guide (version 2.0.0 or later).

If you plan to use CipherTrust Manager as your key source, install and configure it *prior* to installing and configuring CCKM.

Note

You will enter the CipherTrust Manager account information you gather during the installation and configuration of CipherTrust Manager in CCKM (described in this section) when configuring this key source in the **CipherTrust Manager** tab of the **Key Sources** page of the CCKM Admin Portal as part of the initial CCKM configuration. (This initial configuration of CCKM takes place after you install CCKM and login into the CCKM Admin Portal for the first time.)

For any CipherTrust Manager you plan to use as key source for CCKM, the CipherTrust Manager administrator must perform the following:

1. Launch and configure CipherTrust Manager.
2. In CipherTrust Manager, create a CipherTrust Manager user or a LDAP user that has domain and system administrator privileges. Note the user name and password for this user.
3. Note the hostname or the IP address of the CipherTrust Manager during the configuration of CipherTrust Manager. This information is required when you configure the CipherTrust Manager settings in the **CipherTrust Manager** tab of the **Key Sources** page

4. Note the Connection String that will be used to connect CCKM to CipherTrust Manager. By default, the Connection String is "local_account". If an LDAP user is selected, the connection string is the LDAP domain name.
5. Download the server web certificate (in a Base64 format) of the CipherTrust Manager from the CipherTrust Manager server or browser.

Note: The common name of the server web certificate of CipherTrust Manager and its hostname must match. Otherwise, when you proceed to test the connection between the CCKM and CipherTrust Manager (when configuring CipherTrust Manager in the **CipherTrust Manager** tab within **Key Sources** page in the CCKM Admin Portal), the connection fails, and an error message displays.

Install and Configure DSM as Key Source

If you plan to use DSM as your key source, install and configure it prior to installing and configuring CCKM.

Note

You will enter the DSM account information you gather during the installation and configuration of DSM in CCKM (described in this section) when configuring this key source in the **DSM** tab of the **Key Sources** page of the CCKM Admin Portal as part of the initial CCKM configuration. (This initial configuration of CCKM takes place after you install CCKM and login into the CCKM Admin Portal for the first time.)

For any DSM you plan to use as key source for CCKM, a **DSM administrator** must perform the following:

1. Install and configure DSM. Refer to the latest version of the DSM Administration Guide.
2. When configuring DSM, create a DSM administrator account of type "All Admin" for CCKM.
3. Note the following information (as you will enter this information when configuring the DSM key source in the CCKM Admin Portal:
 - DSM fully-qualified host name
 - DSM CCKM administrator name and password for the "All Admin" account.
4. Download the DSM server certificate. For information on how to do this, see [Appendix B: "How to Export Your DSM Server Certificate from DSM" on page 248](#).

Install and Configure nShield Connect as Key Source

Note

This documentation assumes that you are familiar with using the nShield Connect HSM. This documentation also assumes that you have installed nShield Connect, and the associated RFS and Security World. For information on how to install an nShield Connect, and the associated RFS and Security World, refer to the nShield® Connect Installation Guide.

If you plan to use nShield Connect as your key source, install and configure it *prior* to installing and configuring CCKM.

Note

You will enter the nShield Connect account information you gather during the installation and configuration of nShield Connect in CCKM (described in this section) when configuring this key source in the **nShield** tab of the **Key Sources** page of the CCKM Admin Portal as part of the initial CCKM configuration. (This initial configuration of CCKM takes place after you install CCKM and login into the CCKM Admin Portal for the first time.)

For any nShield Connect you plan to use as key source for CCKM, the nShield Connect administrator must perform the following:

Note

To complete the configuration of nShield Connect, you are required to install CCKM and note its IP address or already know the IP address of CCKM. After obtaining the IP address of the CCKM, you can return to completing the nShield Connect configuration by adding the IP address of CCKM as an nShield client (last step).

1. Configure nShield Connect and note its IP address. You will add this IP address when you configure CCKM to connect to the nShield Connect.
2. Set up RFS and note its IP address. You will add this IP address when you configure CCKM to connect with nShield Connect.
3. Set up Security World.
4. In the nShield Connect, configure CCKM as an nShield client by specifying the IP address of CCKM. For information on how to configure the CCKM as an nShield client, refer to the nShield Connect User Guide for Unix.

Chapter 7: Register CCKM App in Azure Cloud

Registering CCKM App in Azure or Azure China Cloud 45

Register CCKM app in Azure **before** adding an Azure cloud in CCKM. CCKM provides support for Azure clouds (Azure and Azure China).

Registering CCKM App in Azure or Azure China Cloud

Before adding an Azure cloud in CCKM, you must register the CCKM App and assign required permissions in the Azure portal. If you are using the CCKM App as a service principal, then you must also assign the Azure role of "Contributor" to the service principal to grant the CCKM App access to Azure resources. Then depending on the type of app credential you plan to employ, either create a key (client secret) in the Azure portal or generate a certificate from CCKM, download it, and then upload it to Azure. This entire process generates the connection data needed to configure the Azure cloud.

Also before configuring an Azure cloud in CCKM, refer to the following related sections to review information about how Azure allows external applications, such as CCKM, to access and manage resources within Azure and the two types of app credentials employed when registering apps in Azure:

- ["Accessing and Managing Azure Resources" on page 117](#)
- ["Registering Apps in Azure" on page 118](#)

The steps to create the connection between CCKM and an Azure Key Vault are the same for Azure and Azure China.

Note

The UI within the Azure portal changes periodically. In regards to the documentation relating to Azure App Registrations, this documentation reflects the legacy App Registrations, which displays as App registrations (Legacy) in the Azure portal. If you are using the new Azure AD app registration, refer to the Azure online documentation for information regarding the equivalent steps (documented in this section) that you would perform in the new Azure AD app registration.

Note

In a production environment, Thales recommends that you **DO NOT** change the cloud configuration for Azure or Azure China by changing the setting for the **Use CCKM as Service Principal** check box.

Create an Azure Active Directory Application (Multi-tenanted) in Azure Portal

To create an Azure Active Directory application in the Azure portal:

1. In the Azure Active Directory > App registrations > New application registration, provide the following parameters:
 - **Name:** choose a name for the app that CCKM will use to access Azure.
 - **Application type:** Web app/API
 - **Sign-on URL:**
https://{CCKM Instance Host name}:8443/kmaas/login/azure (for Azure)
https://{hostname}:8443/kmaas/login/azureChina (for Azure China)

- If you are using CCKM as a service principal, then in addition to the above URLs, also add the following URLs.

Note: In all cases, {hostname} must resolve to either the IP address of your CCKM Instance, or, for CCKM clusters, the IP address of the load balancer. For more information about CCKM cluster configuration, see ["CCKM Cluster Configuration" on page 65](#)

For Azure:

https://{CCKM Instance Host name}:8443/kmaas/auth2/azure

https://{CCKM Instance Host name}:8443/kmaas/azureAdminConsent/azure

For Azure China:

https://{hostname}:8443/kmaas/auth2/azureChina

https://{hostname}:8443/kmaas/azureAdminConsent/azureChina

2. Click **Create** to create the app.
3. Access the new app under **App Registrations**.
4. From **App Registrations** > {App Name} > **Settings**: Note the **Application ID**. This is the "Client ID" used when configuring the cloud within CCKM.
5. From **App Registrations** > {App Name} > **Settings** > **Properties**: select **Yes** for **Multi-tenanted**.
6. Click **Save**.

Set Required Permissions on CCKM App

To set the required permissions on the CCKM app in the Azure portal:

1. Access **App Registrations** > {App Name} > **Settings** > **Required Permissions**.
2. Click **+Add** and add the following APIs and their associated permissions:
 - **Azure Key Vault | DELEGATED PERMISSIONS** | ✓ Have full access to Azure Key Vault service
 - **Windows Azure Service Management API | DELEGATED PERMISSIONS** | ✓ Access Azure Service Management as organization users (preview)
 - **Windows Azure Active Directory (Microsoft.Azure.ActiveDirectory) | DELEGATED PERMISSIONS** | ✓ Sign in and read user profile
 - **Microsoft Graph | DELEGATED PERMISSIONS** | ✓ Read directory data

Note: The Microsoft Graph permission is an **optional** permission. The Microsoft Graph permission is required to query the names of the Azure applications or services using an Azure key from Azure Logs Analytics when you generate the **Azure Key Service Usage Report** from CCKM. The generated report includes the names of these applications or services and other related information. ***Without this permission set, the IDs (instead of the names) of the applications or services using an Azure key are included in the report after you run it.***

3. Select **Grant Permissions** and select **Yes**. (You must have Azure administrator permissions to Grant Permissions as required by the Microsoft Graph API.)

Assign Azure Contributor Role to CCKM App as Service Principal

To assign the Azure role of "Contributor" to the CCKM App as a service principal in the Azure portal:

1. Access **Subscriptions** > {*Subscription Name*} > **Access control (IAM)**.
2. Click the **Role assignments** tab to view the role assignments.
3. Click **Add** > **Add role assignment**. The **Add role assignment** pane displays.
4. In the **Role** list, select the **Contributor** role.
5. In the **Assign access to** list, select **User, group, or service principal** to assign access to the service principal.
6. In the **Select** list, select the name for the App Name that CCKM will use to access Azure.
7. Click **Save**.

Create a Key in Azure Portal

If you will use a secret key or client secret in Azure as part of registering the apps in Azure, create this key in Azure. When setting access to an Azure cloud in the CCKM as part of adding a cloud to CCKM, you will provide this secret key.

To create a secret key (or client secret) in the Azure portal:

1. Access **App Registrations** > {*App Name*} > **Settings** > **Keys**.
2. Enter a key name in **Key description** box.
3. Select a duration period in the **Duration** box.
4. Click **Save**. The **Key Value** column displays the new client secret.

WARNING

Copy this value and store securely; it cannot be retrieved after leaving this view. It will display as Hidden within the Value column. (This value is the "client secret" used when configuring the cloud in CCKM.)

Chapter 8: Setting Up CCKM App for Access to Google Cloud

Set Up OAuth Consent Screen and Request Verification	48
Enable Identity and Access Management API	49
Enable Cloud Resource Manager API	49
Enable Cloud Key Management Service (KMS) API	49
Create OAuth2 Client ID Credentials	50
Set Session Duration for Google Cloud Console	50
Create Service Account	51
Grant IAM Roles to User and Service Accounts	52
Create Custom Roles	53

Prior to configuring and accessing the Google Cloud KMS in CCKM, ensure all of the prerequisites are met within the Google Cloud console. See "[Prerequisites on Google Cloud](#)" on page 151 for a list of all of the prerequisites. This chapter provides information on how to perform most of these prerequisites. For information on how to address the other prerequisites not covered in this document, refer to the Google Cloud online documentation.

Note

This documentation assumes that you are familiar with using Google Cloud Platform, Google Cloud KMS, and Google Identity and Access Management (IAM). For details about these Google technologies, refer to the Google Cloud documentation at <https://cloud.google.com/docs>.

Set Up OAuth Consent Screen and Request Verification

Before your CCKM users can authenticate to Google Cloud, a consent screen will be required to display. This screen will allow your users to choose whether they will allow access to their private data, as well as provide them a link to your terms of service and privacy policy. The consent screen is set up at the project level.

Note

As part of the OAuth Consent screen setup, you will be adding a scope that is sensitive. This type of scope requires verification from the Google Cloud security team, which can take approximately four to six weeks to complete.

For development purposes, the consent screen does not need to be submitted for verification. However, OAuth is restricted to 100 sensitive scope logins until the consent screen is published.

After performing the steps in this section, the next step to take is to enable IAM API (see "[Enable Identity and Access Management API](#)" on the next page).

To set up your consent screen for a project and request verification:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. From the left-side menu, select **APIs & Services**. The **APIs & Services** dashboard displays.
4. From the left-side menu, click **OAuth consent screen**. The **OAuth consent screen** displays.

5. From the **Application Type**, select **Public** or **Internal** depending on whether you will allow users to access CCKM outside of your organization. A public application allows access to users *outside* of your organization as well as inside your organization while an internal application allows access to users from your organization.
6. In the **Application name** box, enter the name of the app asking for consent. This is the name of your CCKM app.
7. Under **Scopes for Google APIs**, click **Add scope** and add ".../auth/cloudkms" and ".../auth/cloud-platform" as required scopes.
8. Under **Authorized domains**, enter the domain name of your organization and press **Enter**.
9. Click **Save**.
10. Click **Submit** for verification.

Enable Identity and Access Management API

Note

Enable IAM APIs after you set up your consent screen for a project and request verification (see ["Create OAuth2 Client ID Credentials" on the facing page](#) and after you create a service account for a project (see ["Create Service Account" on page 51](#)).

To enable IAM APIs:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. In the search box, enter "Identity and Access Management".
4. Select **Identity and Access Management (IAM) API**. The **Identity and Access Management (IAM) API** page displays.
5. Select the **ENABLE** button.

Enable Cloud Resource Manager API

To enable Cloud Resource Manager APIs:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. In the search box, enter "Cloud Resource Manager API".
4. Select **Cloud Resource Manager API**. The **Cloud Resource Manager API** page displays.
5. Select the **ENABLE** button.

Enable Cloud Key Management Service (KMS) API

To enable Cloud Key Management Service (KMS) APIs:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. In the search box, enter "Cloud Key Management Service (KMS) API".

4. Select **Cloud Key Management Service (KMS) API**. The **Cloud Key Management Service (KMS) API** page displays.
5. Select the **ENABLE** button.

Create OAuth2 Client ID Credentials

CCKM must have authorization credentials that identify itself to Google's OAuth 2.0 server. The OAuth credentials will be known to both CCKM and Google Cloud. You are required to create credentials for your project. CCKM will use these credentials that you have enabled for your project to access Google Cloud APIs. It is these credentials (Client ID and Client secret) that you will enter in the CCKM Admin portal to add Google Cloud service to CCKM.

Note

After creating the OAuth2 client ID credentials, copy the Client ID and Client secret from the **Web application** page, paste this information into a file, and then save it. When adding a Google Cloud service to CCKM, refer to this file to obtain the Client ID and Client secret.

To create the OAuth 2 Client ID credentials:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. From the left-side menu, select **APIs & Services**. The **APIs & Services** dashboard displays.
4. From the left-side menu, click **Credentials**. The **Credentials** page displays.
5. Click **+ Create Credentials**, then select **OAuth client ID**.
6. In the **Application type** drop-down menu, select **Web application**.
7. In the **Name** box, enter the name of your OAuth client (CCKM app name).
8. Under **Authorized redirect URIs**, click **+ ADD URI** and enter the CCKM redirect URI(s) in the **URIs** box. The OAuth 2.0 server will use the redirect URI(s) (CCKM endpoint(s) to which to send its responses. For example, ***https://cckm.example.com:8443/kmaas/login/googleCloud*** where "cckm.example.com" is the fully qualified domain name of your CCKM.
9. Click **Create**. The **Client ID for Web application** page displays including the name of OAuth client, Client ID, Client secret, and creation date.

Set Session Duration for Google Cloud Console

As organization administrator, you can configure a fixed session duration for specific apps and services that use Google Cloud. With a fixed session duration set, users are required to re-enter their login credentials to continue to access the Google Cloud console after the session expires.

If your Google user account belongs to an organization, your refresh token will be affected by your organization's security policy for Google Cloud session control. For more information, see [Control session length for Google Cloud Console and gcloud CLI](#).

If you are employing key rotation and key synchronization schedules in CCKM, you are required to use the session duration option of **Session never expires** when setting your security policy for Google Cloud session control. Otherwise, your scheduled job will fail when the given schedule begins. This is due to CCKM saving the refresh token (to MongoDB) that it obtains from Google Cloud when a user logs into CCKM for the first time. When CCKM runs the scheduled job, it uses the refresh token to obtain an access token from Google Cloud. Due to the security policy for session control being set, the saved refresh token expires after the session duration (1 to 24 hours

depending on configuration), disallowing CCKM from obtaining the access token to begin the scheduled job. As a result, the scheduled job will fail. To ensure the scheduled job is successful, set the session duration to **Session never expires**.

Note

If you are employing key rotation and key synchronization schedules in CCKM, it is recommended that you first create an organization unit, and then add all the users who will use CCKM to that unit. Thereafter, change the security policy for that unit to **Session never expires**.

As an *alternative* to setting the session duration to **Session never expires** for your security policy for session control to avoid the failure of scheduled jobs, use service accounts. You can create a service account, use the service account to authenticate to the CCKM REST API, and then add schedules using CCKM REST API. These schedules added by the service account do not use refresh tokens and are not affected by the security policy for session control. For more information about creating a service account, see ["Create Service Account" below](#).

To set up a session duration for an organization:

1. Login as admin of your organization at the Google Admin console (<https://admin.google.com>).
2. From the home page, go to **Security** and then Google Cloud session control (Beta).
3. Under **Organization Unit** (on the left), select your organization unit.
4. Under **Session duration**, configure the session duration using *one* of the following ways:
 - a. If you will set up key rotation and key synchronization schedules in CCKM, select **Session never expires** so that the session never expires.
 - b. Select **Set session duration** and from the drop-down list for **session duration**, select from 1 to 24 hours.
5. Click **Save**.

Create Service Account

To employ CCKM REST APIs to manage Google Cloud keys, you will need to use a service account from Google Cloud to authenticate to the CCKM REST APIs.

Note

After successfully creating your service account, take note of the email address that Google Cloud assigned to it. You are required to enter this email address when adding service account to CCKM.

After performing the steps in this section, proceed to enabling IAM API (see ["Enable Identity and Access Management API" on page 49](#)). Thereafter, grant IAM Roles to the service account (see ["Grant IAM Roles to User and Service Accounts" on the facing page](#)).

To create a service account for a project:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. From the left-side menu, select **IAM & Admin > Service Accounts**. The **Service Accounts** dashboard displays.
4. Click **+ CREATE SERVICE ACCOUNT**. The **Create service account** page displays.
5. In the **Service account name** box, enter the name of the service account.
6. (Optional) In the **Service account description** box, enter a description of the service account.
7. Click **Create**.

Grant IAM Roles to User and Service Accounts

For your user account or service account to use CCKM, grant the Project Browser and Cloud KMS Admin roles to the account. If your project belongs to an organization, then it is recommended that you grant the Organization Viewer role to your accounts.

The role of Project Browser allows read access to browse the hierarchy of a project, including the folder, organization, and IAM policy. The role of Cloud KMS Admin gives full access to Cloud KMS resources with the exception of encrypt and decrypt operations. Access to view an organization name is given through the use of the Organization Viewer role. This role allows CCKM to find the organization to which the account belongs and display the organization name within the CCKM User Portal. For more information about Google Cloud roles, see [Predefined roles within Google Cloud online documentation](#).

If you are using a service account, the next step to take after performing the steps in this section is to add a service account in CCKM. See ["Adding Google Cloud Service Account to CCKM" on page 180](#) for more information. Thereafter, you can use the service account to authenticate CCKM REST API. After successfully authenticating to the CCKM REST APIs, you can proceed to making calls to CCKM REST APIs to manage Google Cloud keys. For more information, see [Appendix D: "Sample Python Scripts for Authenticate and Call CCKM REST API" on page 251](#) and [Appendix E: "Authenticate your REST API Client to CCKM REST APIs for Google Cloud Keys" on page 258](#).

If this permission is not granted to the user who logs into CCKM, this user will not be able to see the organization name. Only the organization ID will be displayed for the user on CCKM.

Grant Project Browser and Cloud KMS Admin Roles

To grant the roles of Project Browser and Cloud KMS Admin to your user account or service account:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. From the left-side menu, select **IAM & Admin > IAM**. The **IAM** dashboard displays.
4. Click **+ ADD**. The **Create service account** page displays.
5. In the **New members** box, enter the username of your user account you wish to grant roles (if this is for a user account). Enter the email address of the service account you wish to grant roles (if this is for a service account).
6. In the **Select a role** box, select the role of **Project** (on the left), and **Browser** (on the right).
7. Click **ADD ANOTHER ROLE**.
8. In the **Select a role** box, select the role of **Cloud KMS** (on the left), and **Admin** (on the right).
9. Click **Save**.

Grant Organization Viewer Role

If your user or service account belongs to a project that is a member of an organization, and you wish to view the organization name in CCKM, then grant the role of Organization Viewer to these accounts at the organization level in addition to granting the roles of Project Browser and Cloud KMS Admin at the project level. Granting the role of Organization Viewer is *optional*. If you do not grant the Organization Viewer role to your accounts, the organization name does not display in CCKM. Instead, only the organization ID displays.

Note

To grant the role of Organization Viewer to your user or service account, the role of Organization Administrator is *required*. If you do not have this role, make the request of your Organization Administrator to grant this role to your user or service account.

To grant the Organization Viewer role to your user account or service account:

1. (As an Organization Administrator) Go to the Google Cloud Platform Console.
2. From the Organization list, select the organization in which the CCKM app belongs.
3. From the left-side menu, select **IAM & Admin > IAM**. The **IAM** dashboard displays.
4. Click **+ ADD**. The **Create service account** page displays.
5. In the **New members** box, enter the username of the user account you wish to grant the role (if this is for a user account). Enter the email address of the service account you wish to grant the role (if this is for a service account).
6. In the **Select a role** box, select the role of **Resource Manager** (on the left), and **Organization Viewer** (on the right).
7. Click **Save**.

Create Custom Roles

If you wish to grant specific permissions to users or groups to meet your specific requirements, then create custom roles. Group one or more of the supported permissions into a custom role and grant this role to users or groups. See ["Create Custom Roles" above](#) table for the permissions that are required for each of the supported CCKM actions.

To create custom roles to use for CCKM:

1. Go to the Google Cloud Platform Console.
2. From the projects list, select the project to which the CCKM app belongs.
3. From the left-side menu, select **IAM & Admin > Roles**. The **Create Role** dashboard displays.
4. In the **Title** box, enter the name of the custom role.
5. Click **+ ADD PERMISSIONS**. The **Add permissions** page displays.
6. From the list of permissions, select the permission(s) you wish to use for the custom role.
7. Click **ADD**.

Chapter 9: Create a Connected CCKM App in Salesforce

Creating a Connected CCKM App in Salesforce	54
Editing CCKM App to Update OAuth Policies	55

Before adding a Salesforce, Salesforce Government, or Salesforce Sandbox cloud in CCKM, you must create a connected CCKM app and assign the required permissions to it in the given Salesforce portal (Salesforce, Salesforce Government, or Salesforce Sandbox).

If you are employing key rotation and key synchronization schedules in CCKM, you are required to set the **refresh token for the app is valid until revoked** within **Refresh Token Policy** of OAuth policies **after** successfully creating a connected CCKM app in Salesforce.

Note
In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

Note
The information regarding Salesforce in this document is applicable to Salesforce, Salesforce Government, and Salesforce Sandbox unless otherwise noted. The CCKM UI for Salesforce, Salesforce Government, and Salesforce Sandbox is identical with the exception of the display of the names of the clouds. Your login credentials for Salesforce, Salesforce Government, and Salesforce Sandbox are unique to each cloud.

Note
Salesforce provides the following profile interfaces: original profile user interface and enhanced user interface. The procedures provided in this chapter reflect the enhanced user interface. For more information about the Salesforce profile interfaces, refer to the appropriate Salesforce online documentation.

Creating a Connected CCKM App in Salesforce

Note
Prior to creating a connected CCKM app in Salesforce, ensure you have the required user permissions to create connected apps. For information about these user permissions, refer to the appropriate Salesforce online documentation.

1. In the Salesforce app creation interface, provide basic information of the app. For example, app name, and description.
2. Define how the app communicates with Salesforce using the following **API** parameters:

- Select the **Enable OAuth Settings** check box.

- Within the **Callback URL** box, add the callback URLs for Salesforce, Salesforce Government, or Salesforce Sandbox depending on which cloud you are configuring.

Callback URL for Salesforce: `https://{hostname}:8443/kmaas/login/salesforce`

Callback URL for Salesforce Government: `https://{hostname}:8443/kmaas/login/salesforcegov`

Callback URL for Salesforce Sandbox: `https://{hostname}:8443/kmaas/login/salesforcesandbox`

{hostname} must resolve to the IP address of your CCKM Instance.

Note: If you plan to deploy a CCKM cluster, then the {hostname} must resolve to the IP address of the load balancer. For more information about CCKM cluster configuration, see ["CCKM Cluster Configuration" on page 65](#).

- For **Selected OAuth Scopes**: add the following options:
 - **Access and manage your data (api)**
 - **Access your basic information (id, profile, email, address, phone)**
 - **Perform requests on your behalf at any time (refresh_token, offline_access)**

3. Click **Save**. The **Consumer Key** is created and displayed, and the **Consumer Secret** is created.

Note the consumer key and secret and store them securely; you will use them when adding the Salesforce, Salesforce Government, or Salesforce Sandbox cloud in CCKM.

Editing CCKM App to Update OAuth Policies

If you are employing key rotation and key synchronization schedules in CCKM, you are required to set the **Refresh token is valid until revoked** within **Refresh Token Policy** of Salesforce OAuth policies **after** successfully creating a connected CCKM app in Salesforce. Otherwise, your scheduled job will fail when the schedule begins. This is due to CCKM saving the refresh token (to MongoDB) that it obtains from Salesforce cloud when you log into CCKM for the first time. When CCKM runs the scheduled job, it uses the refresh token to obtain an access token from Salesforce cloud. However, the saved refresh token does expire after the session duration (1 to 24 hours depending on configuration) disallowing CCKM from obtaining the access token to begin the scheduled job. As a result, the scheduled job will fail. However, you can set the Salesforce **Refresh Token Policy**, which determines how long a refresh token is valid, so that the refresh token is valid until revoked. Setting the **Refresh token is valid until revoked** allows the connected CCKM app to use the refresh token indefinitely (unless you or your administrator revoke it). To ensure the scheduled jobs are successful, set the **refresh token for the app is valid until revoked** setting. For more information about Salesforce refresh access tokens, refer to the appropriate Salesforce online documentation.

Note

If you are upgrading from older versions of CCKM to the current version of CCKM and using CCKM for Salesforce or Salesforce Sandbox key management, this section is also applicable to you. After upgrading to the latest version of CCKM, perform the procedure in this section. Otherwise, you will **not** be able to log into the CCKM User Portal for any of the Salesforce clouds including Salesforce Sandbox.

To set the **Refresh token is valid until revoked** setting as part of the Salesforce OAuth policy settings of the connected CCKM app:

1. From **Manage Apps > Connected Apps > {created_CCKM_connected_app}**, click **Action**.
2. Select **Edit** from the drop-down menu.
3. From the **Connect App Edit** page, select **Refresh token is valid until revoked** within **OAuth Policies > Refresh Token Policy**.
4. Click **Save**.

Chapter 10: Install CCKM

Install on VMware ESXi Server	58
Install on AWS	59
Install on Microsoft Hyper-V	61
Launch on Azure Marketplace	61
Use SSH to Change the Default Password on the CCKM VM	61
Synchronize CCKM Local time with Network Time using NTP Server	62
Configure Multiple NICs on CCKM Instance	63
Access the CCKM GUI	64
CCKM Cluster Configuration	65

Install CCKM on VMware, AWS, or Microsoft Hyper-V environments. For the Azure Marketplace, launch and configure CCKM from the marketplace.

Note

CCKM is supported on VMware ESXi 6.0 and later versions.

After installing CCKM and changing the default password, the **first** step to take is to synchronize the local time with network time using your preferred Network Time Protocol (NTP) server(s). Ensure at least one NTP server is configured. For more information, see ["Synchronize CCKM Local time with Network Time using NTP Server" on page 62](#).

(Optional) If you wish to use multiple NICs, configure the NIC(s) **after** adding an NTP server to CCKM and synchronizing with it. Then proceed to with accessing the CCKM GUI **after** completing the NIC configuration.

Install on VMware ESXi Server

To create the CCKM Server on a VMware ESXi server, load the CCKM server's .ova template file in the VMware ESXi server and create the VM. Give the CCKM VM a name and keep the default resource settings.

Take note of the IP address of the VM. This will be the IP Address of CCKM.

Install on AWS

The administrator should be familiar with AWS in general and AMI installations in particular.

Start the Installation

Contact Thales Support to obtain the CCKM Amazon Machine Image (**AMI**).

1. Log in to your AWS account.
2. Find the AMI in the AWS Dashboard at **EC2 > IMAGES > AMIs > Private images**.
3. Select the correct version of the CCKM AMI and click **Action > Launch**.
4. At **Choose an Instance Type**, select:
 - **Family**: General Purpose
 - **Type**: m4.xlarge
 - **vCPUs**: 4
 - **Memory**: 16
 - **Network Performance**: High
5. Click **Next**: Configure Instance Details.

Step 3: Configure Instance Details

Configure the instance details. You can't launch or update instances (or use the console) until you've specified the instance type, which determines the hardware configuration of the instance, such as the number of vCPUs, memory, and network bandwidth.

Number of instances	1	Launch into Auto Scaling Group
Purchasing option	On-Demand Instance	
Network	us-east-1c	Create new VPC
Subnet	us-east-1c	Create new subnet
Auto-assign Public IP	Yes (will be setting later)	
Placement group	Default	Create new Placement group
Capacity reservation	None	Create new Capacity reservation
Launch type	On-demand	Create new On-demand
Shutdown behavior	Stop	
Instance-level metrics	Basic	
Monitoring	Amazon CloudWatch	
Termination protection	Off	
T2 Unlimited	On	

Configure Instance Details

Fill out the *Configure Instance Details* page as follows:

1. In the **Network** box, select a VPC.
2. Select your subnet; it must be in the same subnet as the CipherTrust Manager or DSM depending on which key source you are using.
3. If you want the CCKM available on a public IP address, then set *Auto-assign Public IP* to **Enable**.

This will become the CCKM GUI address.

4. Click **Next: Add Storage**.
5. Continue to "[Complete the Installation](#)" below.

Complete the Installation

On the *Add Storage* page:

1. Use the default settings for adding storage. Click **Next: Tag Instance**.
2. In the *Tag Instance* page, create a name (key) and value to help organize your Amazon resources. In the *Name* column, type "**Name**". In the *Value* column, type the name you want to use for this instance. Note the following about tags (from Amazon's AWS documentation):
Tags don't have any semantic meaning to Amazon EC2 and are interpreted strictly as a string of characters. Also, tags are not automatically assigned to your resources. You can edit tag keys and values, and you can remove tags from a resource at any time. You can set the value of a tag to an empty string, but you can't set the value of a tag to null. If you add a tag that has the same key as an existing tag on that resource, the new value overwrites the old value. If you delete a resource, any tags for the resource are also deleted.
3. Click **Next: Security Group**.
4. Select **Create a new security group**, enter a group name, and click **Add Rule** to configure the following sets of parameters:

- **Type:** SSH, **Port:** 22, **Source:** specify the SSH source that can reach your instance
- **Type:** HTTPS, **Port:** 443, **Source:** This port is used to access the CCKM Admin UI (CCKM Admin Portal)
- **Type:** HTTPS, **Port:** 8443, **Source:** This port is used to access the CCKM GUI (CCKM user portal)

Note: Rules with source 0.0.0.0/0 allow all IP addresses to access your instance (*not recommended*). Do not leave source IP addresses with the default 0.0.0.0/0.

5. Click **Review** and Launch.
6. Review parameters and click **Launch**.
A dialog box allows you to define a new public key and private key for EC2.
7. Create a new key/value pair and click **Launch Instances**.
8. You can now use the public or private DNS in your browser to access the CCKM GUI.

Install on Microsoft Hyper-V

To create a CCKM server on a Microsoft Hyper-V environment, load the CCKM VHD file and then create a virtual machine (VM) with the Hyper-V Manager. After you create the VM, you can begin to configure CCKM using the CCKM CLI.

Create CCKM VM

To create a CCKM VM with Hyper-V Manager:

1. In Hyper-V Manager, right-click and select **New Virtual Machine** to start the Hyper-V wizard.
2. Review the **Before You Begin** content (if it displays) and click **Next**.
3. At the **Specify Name and Location** page, specify the name for your VM and click **Next**.
4. At the **Specify Generation** page, leave the default of **Generation 1** and click **Next**.
5. At the **Assign Memory** page, enter the minimum of 4096 MB and click **Next**.
6. At the **Configure Networking** page, select the desired network connection and click **Next**.
7. At the **Connect Virtual Hard Disk** page, select **Use an existing virtual hard disk**, browse to select your CCKM VHD file, and click **Next**.
8. At the **Summary** page, click **Finish** to complete the wizard.

Power on CCKM VM and Connect to It

To power on the CCKM VM, connect to it, and then log into the CCKM CLI:

1. Right click on your new VM and select **Start** to power it on.
2. Right click on the VM again and select **Connect** to open a console for your VM.
3. Wait until the "cckm login" prompt displays (this may take a few minutes) and then log into CCKM CLI to configure your CCKM VM.

Launch on Azure Marketplace

Launch and configure CCKM from Azure Marketplace. Refer to the Azure online documentation for information.

Use SSH to Change the Default Password on the CCKM VM

After launching CCKM on a VM, it is important to change the default password as a security measure. To do so:

Note

After changing the default password, the **next** step is to add an NTP server to CCKM and synchronize the local time with the network time. For more information, see ["Synchronize CCKM Local time with Network Time using NTP Server" on the next page](#).

1. SSH to the IP address of the new VM (the IP address of CCKM).
2. Enter the username and password as prompted.
Username: cliadmin
Password: cliadmin123

3. Follow the prompt: Enter the old password, and then a new password twice. **Store securely.**
ATTENTION: This username/password combination is used to access the VM via SSH. There is no way to recover a forgotten password—in this case, the VM would have to be discarded and a new CCKM launched.
4. The SSH session automatically ends. To validate, launch a new session and log in with the new password.

Synchronize CCKM Local time with Network Time using NTP Server

In this release of CCKM, the local time on CCKM server is no longer synchronized with the network time. **After installing CCKM** and changing the default password, the **first** step to take is to synchronize the local time with the network time using your preferred Network Time Protocol (NTP) server(s). For example purposes, the “pool.ntp.org” is used as the NTP server. However, you can use any NTP server you wish to use.

Note

At least one NTP server must be configured **before** you configure to add the NTP server to CCKM and synchronize with it.

After adding an NTP server to CCKM and synchronizing the local time with the network time, the **next** step is to access the CCKM GUI. For more information, see ["Access the CCKM GUI" on page 64](#). However, if you are using multiple NICs, then configure the NIC(s) **after** configuring to add the NTP server to CCKM and synchronize with it. Then proceed to access the CCKM GUI **after** completing the NIC configuration. For more information, see ["Configure Multiple NICs on CCKM Instance" on the facing page](#).

To add an NTP server to CCKM and synchronize the CCKM local time to the network time:

1. Access your CCKM server through SSH (such as Putty):

```
ssh cliadmin@<cckmhost>
```
2. Enter your user password when prompted:

```
cliadmin@>cckmhost>'s password:  
CCKM CLI Main Menu  
cckm>
```
3. Access the CCKM Network command category:

```
cckm> network
```
4. Access the NTP service settings and add the named NTP server to contact for time synchronization:

```
network> ntpservice --add pool.ntp.org  
NTP Servers:  
pool.ntp.org
```
5. Perform immediate clock synchronization with the configured NTP server:

```
network> ntpservice --sync  
Synchronizing time with NTP server(s):  
pool.ntp.org  
19 Mar 23:23:25 ntpdate[18641]: step time server 217.91.44.17 offset  
29286.555701 sec
```

6. Verify that the status of the NTP service is enabled:

```
network>
network> ntpservice --status
enabled
Active: active (running) since Thu 2020-03-19 14:58:26 PDT; 8h ago
No association ID's returned
network>
```

Configure Multiple NICs on CCKM Instance

CCKM supports multiple network interface controllers (NICs). This feature is available for ESXi and Azure cloud deployments. It is not available on AWS instances. Using the CLI network commands, you can assign a static IP to each NIC and add new routes to the routing table, **Manually** attach a NIC to a CCKM instance **prior** to performing the configurations in this section.

This section is only applicable to you if you are using multiple NICs.

Configure Network Interface

To configure the interface:

1. Log into the CCKM instance using cliadmin user.
2. View the network device configuration to verify the new NIC is attached to instance:
3. Enter the network command category and configure a static IP address for the specified network interface:

```
network> show --list

network> setup eth1
<dhcp or static>? static
ipv4 address? 10.3.200.201
Subnet mask (e.g., 255.255.255.0)? 255.255.0.0
```

OR

Enable DHCP IP address leasing for the specified network interface:

```
network> setup eth1
<dhcp or static>? dhcp
```

4. Display the network interface setting to view the IP address configuration :

```
network> ip --show
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN group
default qlen 1000
link/loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00
inet 127.0.0.1/8 scope host lo
valid_lft forever preferred_lft forever
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP group
default qlen 1000
link/ether 00:0d:3a:42:91:42 brd ff:ff:ff:ff:ff:ff
inet 10.0.0.6/24 brd 10.0.0.255 scope global eth0
valid_lft forever preferred_lft forever
3: eth1: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc mq state UP group
default qlen 1000
link/ether 00:0d:3a:91:da:8c brd ff:ff:ff:ff:ff:ff
inet 10.0.0.4/24 brd 10.0.0.255 scope global eth1 valid_lft forever preferred_
lft forever
```

Add New Routes to Routing Table

To add a new route to the routing table:

Note

The default route is associated with eth0.

1. From the network commands, add a route to the routing table:

```
route add -net 10.10.65.1/24 gw 10.10.65.254 dev eth1
INFO: Execute 'route --make-persistent' command to make these changes reboot
persistent
```

2. Set the routing table changes to be persistent after a reboot:

```
route -make-persistent
WARNING: This command will make the current routing table persistent after
reboot.
Any invalid configuration in routing table can make the system inaccessible over
the network. Do you wish to continue? <y/n> [n] y
SUCCESS: Routes are now reboot persistent
```

Access the CCKM GUI

Open a browser and point to the CCKM IP address with the https prefix (for example: <https://19.4.5.89>).

Once the CCKM is configured, the CCKM IP address will open to the CCKM GUI Home page.

CCKM Cluster Configuration

For high availability (HA) and improved performance of the CCKM solution, you can set up a CCKM cluster using at least two CCKM servers and one MongoDB database. To set up the CCKM cluster, launch two or more CCKM VMs using the same OVA, AMI, or VHD file for each VM you add to the cluster, configure the VMs to use the same MongoDB database.

When you configure the database information on the second or additional CCKMs (following the steps in section ["Set Up Database" on page 67](#)), enter the same configuration passphrase and database information that you entered (in the **Configuration Passphrase** box) for the first CCKM. This configuration allows the additional CCKM servers to join the first CCKM in the cluster and share the same CCKM configuration in the MongoDB database.

You can access the CCKM Web UI and REST API on any of the CCKM servers.

Optionally you can add a load balancer in front of all CCKM servers. In this case, you can access CCKM Web UI and REST API using your load balancer. When configuring the load balancer, configure the listeners to forward traffic for ports 443 and 8443. For port 8443, enable session stickiness. For example, if you are using an AWS load balancer, enable session stickiness on cookie "JSESSIONID". If you are using an Azure application gateway, enable cookie based affinity. For health check, set the ping target to "https:8443/kmaas/health". Refer to the documentation for the load balancer you are employing in the CCKM cluster for information on how to configure this configuration.

Chapter 11: Initial Configurations within CCKM Admin Portal

Summary of Initial Configuration Steps	66
Change Default Admin Portal Password (During First-time Login)	67
Login into Admin Portal	67
Set Up Database	67
Upload License	67
Configure Key Source	68
Add Cloud	68

This chapter provides the required steps for the initial configuration of the CCKM Admin Portal **after** you install CCKM and login into the CCKM Admin Portal for the **first** time.

After installing CCKM, access the CCKM Admin Portal at https://<CCKM_hostname_or_IP_address> to begin configuring CCKM.

Note

In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

Summary of Initial Configuration Steps

The following is a summary of the required steps to perform during the initial configuration of the CCKM within the CCKM Admin Portal to get you up and running to begin using CCKM. For steps 2 through 6, you are prompted (at the top of the page) with each step to take next. After you *initially* log into CCKM Admin Portal *after* the CCKM installation, you are prompted to change your CCKM Admin Portal password.

1. Change your default Admin Portal password. (See ["Change Default Admin Portal Password \(During First-time Login\)" on the next page.](#))
2. Login into Admin Portal. (See ["Login into Admin Portal" on the next page.](#))
3. Configure your database settings. (See ["Set Up Database" on the next page.](#))
4. Upload your license file. (See ["Upload License" on the next page.](#))
5. Configure your key source (CipherTrust Manager, DSM, or nShield). (See ["Configure Key Source" on page 68.](#))
6. Add cloud(s). (See ["Add Cloud" on page 68.](#))

Change Default Admin Portal Password (During First-time Login)

You are required to change the default admin password for the CCKM Admin Portal **after** your **initial** or first-time login into this portal. As part of the initial login, enter the default admin username of "**admin**" and the default admin password of "**admin123**". When prompted to change the current password, do the following:

1. Enter the current admin password (default admin password).
2. Enter your new password.
3. Enter your new password again to confirm it.
4. Click **Update**.

Login into Admin Portal

After changing the admin password, you are prompted to log into CCKM Admin Portal again using your new password. Enter your admin username and password and click **Login**.

Set Up Database

You are prompted to set up your database within the **Settings** page. In the **Database** settings page, you have the following options to configure MongoDB:

- Local Database
- Remote Database
- ReplicaSet Database
- MongoDB Atlas

The CCKM server requires a MongoDB database (MongoDB, MongoDB Atlas, or Percona Server for MongoDB) to store user setup and cloud usage data.

For information on how to configure MongoDB, see "[Configure Database](#)" on page 80. **After setting up MongoDB settings successfully, CCKM restarts.**

Upload License

After the CCKM service is restarted, you are prompted to go to the **Licenses** page to upload your CCKM license(s) for the cloud(s). You must have a valid license file to upload to the **Licenses** page. Once the license file is uploaded to this page, information about this license displays on the page. To obtain your CCKM license(s) for one or more clouds, contact Thales Sales.

To upload a license file:

1. Click **Upload License** at the top of the page.
2. From the **Upload License** dialog box, select **Choose File** and choose the license.
3. Click **Upload**. The license is displayed on the **Licenses** page.

Configure Key Source

You are required to configure the key source as part of your initial configuration of CCKM. You have three options to configure your key source from the **Key Sources** page of the CCKM Admin Portal using the following tabs from this page:

- CipherTrust Manager
- DSM
- nShield

Note

Concurrent use of the CipherTrust Manager, DSM, and nShield as key sources is not supported. Configure **only** one of these supported key sources as a key source.

For information on how to configure a key source, see ["Configure Key Source" on page 73](#)

Add Cloud

As part of your **initial** configuration of CCKM, you are required to add at least one cloud to manage through CCKM from the **Clouds** page of the CCKM Admin Portal. You can also add more clouds after the initial configuration of CCKM. The following are your options:

- AWS
- Azure
- Azure China
- Google Cloud
- IBM Cloud
- Salesforce
- Salesforce Government
- Salesforce Sandbox

For information on how to add a cloud, see ["Manage Clouds " on page 70](#)

Chapter 12: About the Admin Portal

CCKM Admin Portal	69
Manage Clouds	70
Configure Key Source	73
Review Logs	77
Review Health Monitor	77
Review Licenses	79
Settings	80

This chapter describes the Web UI pages of the CCKM Admin Portal and the settings and configurations you can perform using these pages.

Note
In this document, Salesforce Government Cloud Plus is also referred to as Salesforce Government and Salesforce Government Cloud.

CCKM Admin Portal

The CCKM Admin Portal contains the following options in the left-hand navigation bar:

- **Cloud:** From the **Cloud** page, you can create a connection between CCKM and a given cloud to permit CCKM access to any of the cloud-service users with valid user credentials. From this page, you can also delete a cloud.
- **Key Sources:** From the **Key Sources** page, you can configure your key source.
- **Logs:** The **Logs** page lists audit logs related to the actions performed through the CCKM Admin Portal. You can search, sort, and view these audit logs.

- **Health Monitor:** The **Health Check Monitor** page provides a snapshot of the status of all major components in a CCKM solution. In addition, this page provides the option to remove a listing of a CCKM server that has a status of "Bad" from this page.
- **Licenses:** In **Licenses**, you can view all of your available licenses for your configured clouds.
- **Settings:** The **Settings** page allows you to configure database, proxy, SMTP, debug level, key deletion policy, and CCKM admin users.

Manage Clouds

From the **Clouds** page, you create a connection between CCKM and a given cloud to permit CCKM access to any of the cloud-users with valid user credentials. The following are the supported clouds:

- AWS
- Azure
- Azure China
- Google Cloud
- IBM Cloud
- Salesforce
- Salesforce Government Cloud
- Salesforce Sandbox

From the **Clouds** page, you can also delete a cloud.

Add Cloud

Step 1: Add Cloud

1. Select **Clouds** from the left-hand navigation bar, select **Add Cloud**, and then select the cloud you wish to add from the **Cloud** drop-down list. The following are the options:
 - AWS
 - Azure
 - Azure China
 - Google Cloud
 - IBM Cloud
 - Salesforce
 - Salesforce Government
 - Salesforce Sandbox
2. Click **Next**.
3. Proceed to the next section to set access to the cloud.

Set Access to Cloud

Refer to the appropriate section below for information on how to set access to the cloud you are adding.

- If setting access to AWS cloud, see ["Set Access to AWS Cloud" below](#)
- If setting access to Azure cloud, see ["Set Access to Azure \(Azure, Azure China\) Cloud" below](#)
- If setting access to Azure China cloud, see ["Set Access to Azure \(Azure, Azure China\) Cloud" below](#)
- If setting access to Google cloud, see ["Set Access to Google Cloud" on the next page](#)
- If setting access to IBM cloud, see ["Set Access to IBM Cloud" on the next page](#)
- If setting access to Salesforce cloud, see ["Set Access to Salesforce Cloud" on the next page](#)
- If setting access to Salesforce Government cloud, see ["Set Access to Salesforce Cloud" on the next page](#)
- If setting access to Salesforce Sandbox cloud, see ["Set Access to Salesforce Sandbox Cloud" on page 73](#)

Set Access to AWS Cloud

Step 2: Set access to AWS cloud

In this step, set access to AWS cloud:

1. (Optional) Add a description for the cloud.
2. Click **Save**.

Set Access to Azure (Azure, Azure China) Cloud

Step 2: Set Access to Azure (Azure, Azure China) cloud

In this step, set access to Azure or Azure China cloud:

Note

If you will use CCKM as a service principal, then ensure to select the **Use CCKM as Service Principal** box.

1. Enter:

Description: (Optional) the description of the cloud.

Client ID: the 'application id' of the Azure app .

If you are using a client secret, select **Use client secret** and enter the client secret in the **Client Secret for the Azure Application** box.

If you are using a certificate, select **Use certificate** and then click the **Generate and download** button. A message displays indicating a new certificate is generated and ready to download. Download the certificate and save it to a directory within your laptop or desktop. The certificate thumbprint automatically displays in the **Thumbprint** box after you download the certificate.

Note: Upload this certificate to the Azure Portal after completing the configuration of the cloud.

2. If you will use CCKM as a service principal, select the **Use CCKM as Service Principal** check box.

Note: The **Use CCKM as Service Principal** check box acts as a toggle to use CCKM on behalf of users or as a service principal. You can change this setting after completing the configuration of the cloud. To use CCKM on behalf of users, ensure this check box is deselected. In a production environment, Thales recommends that you **DO NOT** change the cloud configuration for Azure or Azure China by changing the setting for the **Use CCKM as Service Principal** check box.

3. Click **Save**.

Set Access to Google Cloud

Step 2: Set Access to Google Cloud

In this step, set access to Google Cloud:

1. (Optional) Add a description for the cloud.
2. Enter the Client credentials:
 - **Client ID:** The "application id" of the Google Cloud app.
 - **Client Secret:** This is the secret known only to the Google Cloud app and CCKM.
3. Click **Save**.

Set Access to IBM Cloud

Step 2: Set Access to IBM Cloud

In this step, set access to IBM Cloud:

1. (Optional) Add a description for the cloud.
2. Click **Save**.

Set Access to Salesforce Cloud

Step 2: Set Access to Salesforce cloud

In this step, set access to Salesforce cloud:

1. (Optional) Add a description for the cloud.
2. Enter the Client credentials:
 - **Client ID:** The value of the 'Consumer Key' of the Salesforce app.
 - **Client Secret:** The value of the 'Consumer Secret' of the Salesforce app.
3. Click **Save**.

Set Access to Salesforce Government Cloud

Step 2: Set Access to Salesforce Government cloud

In this step, set access to Salesforce Government cloud:

1. (Optional) Add a description for the cloud.
2. Enter the Client credentials:
 - **Client ID:** The value of the 'Consumer Key' of the Salesforce Government app.
 - **Client Secret:** The value of the 'Consumer Secret' of the Salesforce Government app.
 - **My Domain URL:** The value of the 'My Domain URL' of the Salesforce Government app.
3. Click **Save**.

Set Access to Salesforce Sandbox Cloud

Step 2: Set Access to Salesforce Sandbox cloud

In this step, set access to Salesforce Sandbox cloud:

1. (Optional) Add a description for the cloud.
2. Enter the Client credentials:
 - **Client ID:** The value of the 'Consumer Key' of the Salesforce Sandbox app.
 - **Client Secret:** The value of the 'Consumer Secret' of the Salesforce Sandbox app.
3. Click **Save**.

Configure Key Source

You are required to configure the key source as part of your initial configuration of CCKM. You have three options to configure your key source from the **Key Sources** page using the following tabs from this page:

- CipherTrust Manager
- DSM
- nShield

Note

Concurrent use of the CipherTrust Manager, DSM, and nShield as key sources is not supported. Configure only one of these supported key sources as a key source.

To configure CipherTrust Manager, select the **CipherTrust Manager** tab. For information on how to configure CipherTrust Manager, see ["Configure CipherTrust Manager as Key Source" on the next page](#).

To configure DSM, select the **DSM** tab. For information on how to configure DSM, see ["Configure DSM as Key Source" on page 75](#).

To configure nShield, select the **nShield** tab. For information on how to configure nShield, see ["Configure nShield Connect \(for Azure and AWS Clouds\)" on page 75](#).

Configure CipherTrust Manager as Key Source

CCKM provides support for the use of CipherTrust Manager as key source to generate, store, and retrieve the encryption keys that CCKM uses and manages. This section covers how to configure the connection between CCKM and CipherTrust Manager within the **Key Sources** page > **CipherTrust Manager** tab of the CCKM Admin Portal.

Note

Each time you add an additional node to your Key Secure instance that is connected to your (running) CCKM instance or CCKM cluster, a restart of the kmaas app service is required. To restart this service, in the CCKM command line prompt, enter the system command category and then enter the following command: `server --kmaas -restart`. For more information about CCKM CLI commands and the system command category and server command, see ["System Commands" on page 246](#).

Prerequisites

Prior to configuring CipherTrust Manager within the **Key Sources** page, launch and configure CipherTrust Manager. For more information about these prerequisite steps, see ["Install and Configure CipherTrust Manager as Key Source" on page 42](#).

Configuring CipherTrust Manager

To configure **CipherTrust Manager** in the **Key Sources** page > **CipherTrust Manager** tab within the CCKM Admin Portal, perform the following steps:

1. In the **Server** box, enter the hostname or the IP address of CipherTrust Manager.
If the hostname of CipherTrust Manager is not reachable during this configuration, CCKM will display the **IP address** box. If the **IP address** box displays, enter the IP address of CipherTrust Manager in this box.
2. In the **Port** box, enter the port number of CipherTrust Manager web interface. The default value is 443.
3. In the **Connection** box, enter the connection string. The default value is "local_account". The value of "local" is supported. If CipherTrust Manager is integrated with an LDAP server, enter the domain name of the LDAP server.
4. In the **Username** box, enter the username for the CipherTrust Manager admin.
5. In the **Password** box, enter the password for the CipherTrust Manager admin.
6. From the **Certificate** box, select the certificate of CipherTrust Manager. Click **Browse** to select the file.
7. In the **Domain Prefix** box, enter a domain prefix for CipherTrust Manager. The domain prefix is the name of the CipherTrust Manager client. In this case, the client is the CCKM. This name must be unique within CipherTrust Manager.
8. Click **Test Connection** to test the connection between CCKM and CipherTrust Manager. If the test fails, verify that you entered the correct information in the previous steps. Reenter the correct information, if required, and then test the connection again. Otherwise, proceed to the next step.
9. Click **Save**.

Configure DSM as Key Source

CCKM provides support for the use of DSM as key source to generate, store, and retrieve the encryption keys that CCKM uses and manages. This section covers how to configure the connection between CCKM and DSM within the **Key Sources** page > **DSM** tab of the CCKM Admin Portal.

Prerequisites

Prior to configuring DSM within the **Key Sources** page, launch and configure DSM. For more information about these prerequisite steps, see ["Install and Configure DSM as Key Source" on page 43](#).

Configuring DSM

To configure DSM in the **DSM** tab of **Key Sources** page of the CCKM Admin Portal, perform the following steps:

1. In the **DSM Hostname** box, the Fully Qualified Hostname of the DSM, which you can find on the dashboard of the DSM Management Console. Example: dsm-a43.vormetric.com.
2. In the **Domain Prefix** box, enter a unique DSM domain name prefix. Ensure this name conforms to DSM domain name restriction.
3. From the **Certificate** box, select the certificate of DSM . Click **Browse** to select the file.
4. In the **Username** box, enter the username for the DSM admin.
5. In the **Password** box, enter the password for the DSM admin.
6. Click **Save**.

Configure nShield Connect (for Azure and AWS Clouds)

If you are using CCKM to manage keys in Azure or AWS, support for the use of nShield Connect as a key source is available to generate source keys. This section covers how to configure the connection from CCKM to nShield Connect HSM(s), a remote file system (RFS), and the Security World for nShield. This configuration is available within the **Key Sources** page > **nShield** tab of CCKM Admin Portal. The prerequisites steps you are required to perform are also provided in this section.

After successfully configuring the nShield Connect and the associated RFS and Security World in the **Key Sources** page, CCKM runs a number of nShield Connect commands to enroll the CCKM as a new nShield client to the nShield Connect HSM(s), and updates the Security World configuration from the RFS computer. The output of these commands (provided in links) display on the right side of the **nShield Info** page. Be sure to click on each link within the **nShield Info** page to verify that each command ran successfully. If an error message displays, be sure to address the error. For common issues that may arise during the configuration of the connection from CCKM to nShield Connect and the associated RFS and Security World, see ["Troubleshooting nShield Configurations " on page 242](#).

Note

This documentation assumes that you are familiar with using nShield Connect. This documentation also assumes that you have installed nShield Connect, and the associated RFS and Security World. For information on how to install an nShield Connect, and the associated RFS and Security World, refer to the *nShield® Connect Installation Guide*. For information on how to configure nShield Connect, and the associated RFS and Security World, refer to the *nShield Connect User Guide for Unix*.

Prerequisites

Prior to configuring the nShield Connect and the associated RFS and Security World within the Settings page, perform the following steps:

- Install and configure nShield Connect, RFS, and Security World.
- Configure CCKM as an nShield Connect client within the nShield Connect HSM by specifying the IP address of CCKM.

For more information regarding these prerequisite steps, see ["Install and Configure nShield Connect as Key Source" on page 43](#)

Configuring nShield

To configure nShield Connect and the associated RFS and Security World in the **Key Sources** page > **nShield** tab, perform the following steps:

1. From **nShield 1 IP Address**, enter the IP address of the nShield Connect.
2. Select **Add More nShield IP** to add and configure more nShield Connect HSMs.
3. From **nShield RFS IP Address**, enter the IP address of the remote file system (RFS).
4. Click **Add to Security World** to enroll CCKM to Security World. A set of links to the configuration command output display. Click on each link to verify that the commands ran successfully. If an error displays, address it before proceeding to the next step.
5. (Only perform this step, if all of the commands from the previous steps ran successfully.) Click **Save**. This step will restart the hardserver (Security World Software server) on which the CCKM is installed and configured.

Note: If an error occurred during any of the previous steps, and you click **Save**, you will not be able to generate an nShield Connect key within the CCKM Source Key page when you attempt to generate it. An error message displays. For common issues that may arise during the configuration of the connection from CCKM to nShield Connect HSM(s) and the associated RFS and Security World, see ["Troubleshooting nShield Configurations" on page 242](#)

Review Logs

Select **Logs** from the left-hand navigation bar within the CCKM Admin Portal to access the **Logs** page.

This page lists audit logs, describing user actions performed on the Admin Portal, set to Info, Warn, or Error alert levels.

The CCKM administrator can use these logs to review admin activities in CCKM Admin Portal. Note that these logs differ from the logs used by Thales Support for deep troubleshooting (see ["Troubleshooting Logs Files for Thales Support Team" on page 243](#)), and CCKM user audit logs.

From the **Logs** page, you can:

- **Search** by log name or category filter
- **Search** for logs by **Date Range**
- Sort by **Date**, **Event Message**, **Severity**, **Category**, **Event name**, **Where** the activity occurred (which CCKM server), and **Severity** of the alert/Fineness of log capture level.
- Check **More** details to find, for example, uploaded file size, user ID, or timestamp.
- Select a log and **Refresh** it.
- Use **Download Debug Logs** to download debug log files.

Review Health Monitor

Select **Health Monitor** from the left-hand navigation bar within the CCKM Admin Portal to obtain a snapshot of the status of all major components in a CCKM solution.

The screenshot displays the 'Health Check Monitor' page in the CipherTrust Cloud Key Manager interface. The page has a top navigation bar with the product name, a user profile, and a 'Refresh' button. A left sidebar contains navigation icons. The main content area features a table with the following columns: Component, IP Address, Last Check, Status, and Action. Two rows of data are shown, both indicating a 'Good' status for various components including Key Management, Certificate Management, and Cloud Key Manager. The 'Action' column for each row contains a 'Refresh' button.

Component	IP Address	Last Check	Status	Action
Key Management	10.10.10.10	2023-10-10 10:10:10	Good	Refresh
Certificate Management	10.10.10.10	2023-10-10 10:10:10	Good	Refresh

On the **Health Check Monitor** page, the following columns display including ones that provide the status (either “Good” or “Bad”) of each of the major components of a CCKM solution:

- **CCKM Hostname**—The host name of the CCKM instance for which the information is displayed on the **Health Check Monitor** page.
- **IP Address**—The IP address of the CCKM server for which the information is displayed on the **Health Check Monitor** page.
- **Last Checked**—This column displays when the health status of this CCKM server was last checked . A status of “Bad” displayed in this column indicates that the last check took place more than 5 minutes ago, and the CCKM is down.
- **Database**—This column indicates the status of the connection between CCKM and the MongoDB server(s). A status of “Bad” indicates the connection between CCKM and the MongoDB server(s) is down or one or more of the MongoDB servers are down.
- **Data Security Manager, Connection**—This column indicates the status of the connection between the CCKM and DSM. A status of “Bad” indicates the network connection between the CCKM and DSM may be down or the DSM may be down. If a status of “Bad” is displayed for this column, check to see whether the DSM is running and reachable from CCKM.
- **Data Security Manager, Password**—This column indicates whether the configured DSM user password in the CCKM is valid. If the password status is “Bad”, then change it in **DSM** tab of **Key Sources** page of the CCKM Admin Portal.

Note: At a scheduled time (a configured setting in DSM), the DSM Administrator is required to change the DSM user password in the DSM based on security regulations. This change would require an update of this password within CCKM. This is a case when the password in both DSM and CCKM can get out of sync.

- **CipherTrust Manager, Connection**—This column indicates the status of the connection between the CCKM and CipherTrust Manager. A status of “Bad” indicates the network connection between the CCKM and CipherTrust Manager may be down or the CipherTrust Manager may be down. If a status of “Bad” is displayed for this column, check to see whether the CipherTrust Manager is running and reachable from CCKM.
CipherTrust Manager, Password—This column indicates whether the configured CipherTrust Manager user password in the CCKM is valid. If the password status is “Bad”, then change it in **CipherTrust Manager** tab of **Key Sources** page of the CCKM Admin Portal.
- **Cloud Key Manager**—This column indicates the status of the CCKM (software) server running the CCKM User Portal. A status of “Bad” indicates the CCKM server is down, which means the CCKM User Portal is also down. To investigate this issue, check to see whether the kmaas (CCKM) process is running. If the process is not running, restart it by using CLI command **system->server --restart --kmaas**. Also download debug logs by clicking on **Download Debug Logs** on the **Logs** page within the CCKM Admin Portal. You can also download debug logs through the CCKM CLI command **applog->upload**.
- **Configuration Changed**—This column indicates the last time the CCKM configuration was changed on this CCKM.
- **Action**—This column provides the option to remove a listing of a CCKM server that has a status of “Bad” from the **Health Check Monitor** page. The status of a CCKM server displays under the **Cloud Key Manager** column. To remove a CCKM server with a status of “Bad”, find the row that holds the CCKM you wish to remove and click **Remove** (from the **Action** column). The given CCKM server is removed from the **Health Check Monitor** page.

Note

If you remove a listing of a CCKM server that has a status of "Good" from the **Health Check Monitor** page, a background service running on CCKM will add the listing back to the page. This service periodically checks for active CCKM servers, which are connected to MongoDB(s). If an active CCKM server is not yet added to the page, this service adds it as an entry in the **Health Check Monitor** page.

Review Licenses

Select **Licenses** from the left-hand navigation bar within the CCKM Admin Portal to access the **Licenses** page where you can view all of the licenses for your configured clouds.

Note

When a license for a previously configured cloud becomes invalid, you can no longer manage the given cloud's keys through CCKM. The following message displays at the top of the CCKM Admin Portal page, after you upload a license to CCKM that contains an invalid license for at least one cloud:

You currently do not have a valid license for <Cloud name>. If you wish to manage your keys from the mentioned cloud(s) through CCKM, renew your license.

To continue to manage these keys through CCKM, you must renew your license. After renewing your license, upload it to CCKM using the **Upload License** button (top right of the **Licenses** page).

Note

When a license for a configured cloud expires, the following message displays at the top of the CCKM Admin Portal page:

License for <Cloud name> has expired. If you wish to continue to manage your keys from the mentioned cloud(s) through CCKM, renew your license.

After renewing your key, upload it to CCKM using the **Upload License** button (top right of the **Licenses** page).

Cloud Accounts and Subscriptions

(Optional) From the **Cloud Accounts and Subscriptions** box, you can enter the ID numbers (one per line) for each of your cloud accounts, subscriptions, organizations, and projects that you wish to permit to use your CCKM. Enter the following information for each of the supported clouds:

- For AWS, enter the account ID(s).
- For Azure, enter the subscription ID(s).
- For Google Cloud, enter the project ID(s).
- For IBM Cloud, enter the account ID(s).
- For Salesforce, enter the organization ID(s).

If you wish to add a comment about an entry, start a separate line by adding the "#" character before your comment.

Note

If you leave the **Cloud Accounts and Subscriptions** box *blank*, users from other accounts can *also* use your CCKM to manage their cloud keys as long as they have valid cloud login credentials and can access your CCKM User Portal.

Settings

Select **Settings** from the left-hand navigation bar within the CCKM Admin Portal to access the **Settings** page. From the **Settings** page, you can:

- Set or modify the MongoDB settings
- Set or modify the proxy server settings
- Set or modify the SMTP settings
- Set or modify the debug log levels
- Configure user management preferences for the CCKM user portal by allowing CCKM administrators the capability to allow or disallow users to delete source keys from CCKM and enable the masking of user email addresses displayed in CCKM audit logs and reports
- Add and manage the administrator users and set or modify the password security

Configure Database

In the **Database** tab within the **Settings** page, you have the following options to configure MongoDB:

- **Local Database**
- **Remote Database**
- **ReplicaSet Database**
- **MongoDB Atlas**

The CCKM server requires a MongoDB database (MongoDB, MongoDB Atlas, or Percona Server for MongoDB) to store user setup and cloud usage data.

Prior to configuring any of the MongoDB options from the Database page, the MongoDB database server(s) must be deployed. The CCKM solution also includes a built-in version of MongoDB, which is to be used for evaluation and PoC purposes. For the prerequisites *prior* to performing the steps in this section, see [Chapter 5: "Set Up MongoDB" on page 38](#).

When configuring your database, you have the option to perform authentication of the MongoDB users through an AD server using LDAP. Perform the following steps *prior* to enabling this feature in this section: In the AD server, create a user "kmaas_user", and add it to AD group "dbOwner".

Also when configuring your database, it is required that you enter a passphrase. This passphrase is used to derive a master key. The master key, in turn, is used to encrypt all passwords, including the key source (CipherTrust Manager or DSM) and MongoDB passwords, and other sensitive user credentials that are entered into CCKM. The passphrase is shared among all CCKMs within a multi-CCKM environment and must be entered as part of the configuration of each additional CCKM server.

Note

After the passphrase is saved to CCKM, it cannot be changed or deleted. It is important that you note this passphrase for future use. If you configure additional CCKMs for a multi-CCKM environment, then you are required to enter the same passphrase when configuring these CCKMs.

After setting up MongoDB settings successfully, CCKM restarts.

Configure Local Database

If you are using the built-in MongoDB database server within CCKM (for evaluation and PoC purposes only), select to use the local database option from the **Database** page:

1. In **Database** page, select **Local Database**. The following boxes within the **Use Local Database** page are automatically filled with the default values:
Database IP:localhost
Port:27017
Database Name: kmaas
Database Login Credentials:
Username: kmaas_user
Password: *****
2. In the **Configuration Passphrase** box, enter a passphrase. The passphrase must be between 12 and 32 characters long (standard ASCII alphabet characters (a-z, A-Z), integers (0-9), and a limited set of special characters (!@#\$%^&*(){}[])). **It is important that you note this passphrase and store it securely.**
3. Click **Test Connection** to verify that the connection between the MongoDB database server and the CCKM works. If the test is successful, the **Save** button is enabled and you are prompted to save the database setting.
4. Click **Save**. Thereafter, the CCKM Admin and User portals restart. **Be sure to wait for Admin Portal to restart before performing other operations.**

Configure Remote Database

If you are using an external or remote mongoDB database server (single instance) including a Percona Server for MongoDB, select to use the remote database option from the **Database** page:

1. In **Database** page, select **Remote Database**.
2. In the **Configuration Passphrase** box, enter a passphrase. The passphrase must be between 12 and 32 characters long (standard ASCII alphabet characters (a-z, A-Z), integers (0-9), and a limited set of special characters (!@#\$%^&*(){}[])). **It is important that you note this passphrase and store it securely.**
3. In the **Database IP** box, enter the IP address of the MongoDB database server.
4. In the **Database Hostname** box, enter the host name of the MongoDB database server.
5. In the **Port** box, enter the port number of the MongoDB database server.
6. Optional. To use TLS or SSL for a secure connection to the MongoDB, select the **Enable TLS/SSL for secure connection to MongoDB** check box. The **Upload SSL Certificate box** displays. If you performed this step, proceed to the next step. Otherwise, skip to step 8.
7. From the **Upload SSL Certificate** box, click **Choose File** to select the MongoDB Root CA certificate file for secure TLS connection to MongoDB.
8. In the **Database Name** box, enter the name of the MongoDB database.
9. In the **Database Login Credentials** boxes, enter your username and password for the MongoDB database.
10. Optional. Select the **Use LDAP for authentication** box to enable authentication of the MongoDB users through an AD server using LDAP.
11. Click **Check Database Connection** to verify that the connection between the MongoDB database server and

the CCKM works. If the test is successful, the **Save** button is enabled.

- Click **Save**. Thereafter, the CCKM Admin and User portals restart. **Be sure to wait for Admin Portal to restart before performing other operations.**

Configure ReplicaSet Database

If you are using external or remote MongoDB database servers (replica set) including Percona Servers for MongoDB, select to use the replica set database option from the **Database** page:

- In **Database** page, select **ReplicaSet Database**.
- In the **Configuration Passphrase** box, enter a passphrase. The passphrase must be between 12 and 32 characters long (standard ASCII alphabet characters (a-z, A-Z), integers (0-9), and a limited set of special characters (!@#\$%^&*(){}[])). **It is important that you note this passphrase and store it securely.**
- In the **Replica Set Name** box, enter the name of the MongoDB replica set.
- For each instance of the MongoDB, enter the IP address, host name and port number of each database servers in the **Database IP**, **Database Hostname**, and **Port** boxes.
- Optional. If you have more MongoDB instances to add, select the **Add More DB** box and enter the required information.
- Optional. To use TLS or SSL for a secure connection to the MongoDB, select the **Enable TLS/SSL for secure connection to MongoDB** check box. The **Upload SSL Certificate box** displays. If you performed this step, proceed to the next step. Otherwise, skip to Step 8.
- From the **Upload SSL Certificate** box, click **Choose File** to select the MongoDB Root CA certificate file for secure TLS connection to MongoDB.
- In the **Database Name** box, enter the name of the MongoDB database.
- In the **Database Login Credentials** boxes, enter your username and password for the MongoDB database.
- Optional. Select the **Use LDAP for authentication** box to enable authentication of the MongoDB users through an AD server using LDAP.
- Click **Test Connection** to verify that the connection between the MongoDB cluster and CCKM works. If the test is successful, the **Save** button is enabled.
- Click **Save**. Thereafter, the CCKM Admin and User portals restart. **Be sure to wait for Admin Portal to restart before performing other operations.**

Configure MongoDB Atlas

If using MongoDB Atlas database servers, select to use the MongoDB Atlas option from the **Database** page:

- In **Database** page, select **MongoDB Atlas**.
- In the **Configuration Passphrase** box, enter a passphrase. The passphrase must be between 12 and 32 characters long (standard ASCII alphabet characters (a-z, A-Z), integers (0-9), and a limited set of special characters (!@#\$%^&*(){}[])). **It is important that you note this passphrase and store it securely.**
- In the **Atlas Connection String** box, enter the connection string of the MongoDB Atlas. For information on how to obtain this connection string, see ["Obtaining Connection String for Connection Using a MongoDB Driver" on page 1](#).
- In the **Database Name** box, enter the name of the MongoDB Atlas database.
- In the **Database Login Credentials** boxes, enter your username and password for the MongoDB database.

6. Click **Test Connection** to verify that the connection between the MongoDB Atlas and CCKM works. If the test is successful, the **Save** button is enabled.
7. Click **Save**. Thereafter, the CCKM Admin and User portals restart. **Be sure to wait for Admin Portal to restart before performing other operations.**

Set Proxy Settings

Select the **Proxy** tab from the **Settings** page to set (or modify) the proxy server settings.

Note

In the case of a multi-instance CCKM, proxy configuration is not propagated to other instances in the CCKM cluster. You are required to manually configure the proxy settings on each instance in the **Proxy** tab within **Settings** page of the Admin Portal. **If you edit the proxy settings, it is recommended that you logout of the CCKM Admin Portal and then login again to ensure the new settings become effective.**

1. In the **Settings** page, select the **Proxy** tab. The **Proxy Settings** page displays.
2. In the **Hostname** box, enter the hostname or IP address of the proxy server.
3. In the **Port** box, enter the port number of the proxy server.
4. In the **Skip Proxy List** box, enter the hostnames (separated by a pipe symbol "|") that are to pass through the proxy server.
5. (Optional) In the **Username** box, enter the username of the proxy port.
6. (Optional) In the **Password** box, enter the password for the proxy server.
7. Click **Test Connection** to verify that the connection between the proxy server and the CCKM works. If the test is successful, the **Save** button is enabled.
8. Click **Save**.

Set SMTP Settings

In CCKM, SMTP is used to send email notifications for user actions performed and scheduled for the supported clouds. Set optional notification information.

If your SMTP server is configured with a certificate, then you are required to add the SMTP certificate to CCKM **prior** to setting the SMTP settings from the **Settings** page. To add an SMTP server certificate to CCKM, run the following `system` command from the CCKM CLI where `ALIAS` is the name of the SMTP server:

```
system> security --addcert <ALIAS>
```

For more information about the `system` category commands, see [Appendix A: "CCKM CLI Commands" on page 244](#). This appendix provides a high-level overview of each of the command categories that are available in the CCKM.

Note

A single configured SMTP host is common across all configured clouds. Therefore, the SMTP-related configurations that you enter in the SMTP page within the Settings page are applicable to all clouds that you configure.

Select the **SMTP** tab from the **Settings** page to set (or modify) SMTP settings.

1. In the **Settings** page, select the **SMTP** tab.
2. In the **Hostname** box, enter the hostname of the SMTP host.
3. In the **Port** box, enter the port number of the proxy server.
4. In the **From** box, enter the sender's email address.
5. (Optional) In the **Username** box, enter the username of the SMTP port.
6. (Optional) In the **Password** box, enter the password for the SMTP server.
7. click **Save**.

Set Debug Log Level

You can set or modify your the debug log levels (applied to logs that are stored in the file) from the **Debug Logs** tab within the **Settings** page. The following are the debug log levels you can set:

- Trace (Recommended for debugging issues in health check, DSM High Availability (HA), and propagation in cluster)
- Debug (Recommended for debugging any other issues)
- Info (Recommended for normal usage)
- Warn
- Error

To set the debug log levels:

1. Select the **Debug Logs** tab from the **Settings** page.
2. Select the Log level.
3. Click **Save**.

Configure User Portal Preferences

Using the **User Portal Preferences** tab from the **Settings** page, you can configure your user management preferences for the CCKM user portal. From this page, you can do the following:

- Allow or disallow CCKM users to delete source keys from CCKM
- Enable the masking of user email addresses when displayed in CCKM audit logs and reports

Manage Deletion of Source Keys

The **User Portal Preferences** tab from the **Settings** page provides you the capability to allow or disallow CCKM users to delete source keys using the **Allow Source Key Deletion** check box. When this check box is deselected, the **Delete** option in the **Actions** column of the **Key Sources** page is unavailable (not displayed as an option), and the calling of the REST API to delete a source key is denied. By default, the **Allow Source Key Deletion** check box is selected, which allows the deletion of source keys using the **Delete** option or the REST API call.

To manage the deletion of source keys:

1. In the **Settings** page, select the **User Portal Preferences** tab. The **User Portal Preferences** page displays. Within **Source Key Deletion**, the **Allow Source Key Deletion** check box is selected by default.
2. To disallow the deletion of source keys, deselect the **Allow Source Key Deletion** check box.
3. Click **Save** to save the new setting.

Manage Masking of Email Addresses

From the **User Portal Preferences** tab, you have the capability to enable the masking of the user email addresses that display in the **Users** column of CCKM audit logs and reports. By selecting **Mask email addresses** option, all email addresses in audit logs and reports will be obfuscated. This feature is applicable if you are employing email addresses as usernames within your cloud(s). By default, the masking of email addresses is not enabled.

To enable the masking of email addresses:

1. In the **Settings** page, select the **User Portal Preferences** tab. The **User Portal Preferences** page displays. Within **Mask Email Addresses**, the **Do not mask email addresses** option is selected by default.
2. To enable masking, select **Mask email addresses**.
3. In the **Mask start position** box, enter the position within the email address to which to begin the masking. The start position must be greater than 0. For example, if you enter 2 as the start position, masking will begin at the second character within the email address.
4. In the **Number of characters to mask** box, enter the number of characters to mask. The mask length must be greater than 0.
5. Click **Save** to save the new setting.

Manage Users

Select the **User Management** tab from the **Settings** page to manage the users and set or modify the password security.

The CCKM user has the ability to create, enable, disable, and delete additional users from the **User Management** tab.

Note

A user with the username of 'admin' cannot be deleted.

Add User

1. Log in to CCKM, select the **Settings** icon, and choose the **User Management** tab.
2. Click **Add User**.
The **User** dialog box is displayed.
3. Enter the required and optional fields:
 - **Username:** required
 - **First Name, Last Name, Email:** optional
 - **Password/Confirm password:** required. Must be 8 to 20 characters, with at least one capitalized letter,

one lowercase, and one digit.

4. Select the **Active** check box (unless this user should be disabled).
5. Click **Submit**.

Disable User

There are two places from which to disable an administrator user:

1. Within the **Actions** column from the **User Management** page, click **Disable** next to the user's name.
2. Within the **Actions** column from the **User Management** page, click **Update** next the user's name.
3. From the **User** dialog box, you can change First Name, Last Name, Email, and clear the **Active** check box.
4. Click **Submit**.

Enable User

There are two places from which to enable an administrator user:

1. Within the **Actions** column from the **User Management** page, click **Enable** next to the user's name.
2. Within the **Actions** column from the **User Management** page, click **Update** next the user's name.
3. From the **User** dialog box, you can change First Name, Last Name, Email, and clear the **Active** check box.
4. Select the **Active** check box.
5. Click **Submit**.

Delete User

Note

The "admin" user cannot be deleted.

1. Within the **Actions** column from the **User Management** page, click **Delete** next to the username of the user you wish to delete. The **Delete User Confirmation** dialog box displays.
2. Click **Confirm** to confirm the deletion of the username.

Reset Password

The password of the "admin" user cannot be reset through the CCKM Admin Portal. You must use the CCKM CLI to reset password (**resetwebadmin**) of this user. For more information, see [Appendix A: "CCKM CLI Commands" on page 244](#).

To reset the password of a user (besides the "admin" user):

Note

By default, the password you enter below will expire soon after entering it. You are prompted to change this password when you log into the Admin Portal *after* resetting the password.

1. Within the **Actions** column from the **User Management** page, click **Reset** next to the username of the user whose password you wish to reset. The **Enter New Password** dialog box displays.
2. Enter the new password and then enter the password again to confirm it.
3. Click **Confirm**. By default, this password will expire after entering it.
4. Log into the Admin Portal using the new password. You are prompted to change the password.

Update Admin Password Security

Any CCKM user can update the Admin password security information.

1. Log in to CCKM, select the **Settings** icon, and choose the **User Management** tab.
2. Click **Password Security**.
The **Update password security** dialog box is displayed.
3. In the **Password duration (days)** box, enter the number of days in which the admin password expires. The password expiration interval is applied globally to each administrator account. If the administrator does not change the password prior to the expiration, the administrator must reset the password immediately the next time the administrator logs in. The expiration interval is an integer between 6 and 365. The default is 90. The password duration must be set to a value greater than 'Password Expiration Notification'.
4. In the **Password history** box, enter the number of times the current password is permitted to be reused. CCKM maintains a password history. You cannot use the same password more than once per the set limit. The default is 4, and the maximum value that can be set is 12. You can set this value to '0' to permit reuse of the current password.
5. In the **Minimum password length** box, set the minimum number of characters, including blank spaces that must be in a password. The minimum password length is an integer between 8 and 256. The default is 8.
6. In the **Password expiration notification (days)** box, enter the number of days prior to the password expiration at which to begin telling the administrator that their password is about to expire. Administrators are notified of the impending expiration. The notification interval is an integer between 6 and 31. The default is 6.
7. Ensure the **Required upper case** check box is selected to enable the requirement of having at least one uppercase alphabet character in the administrator password. This check box is enabled by default. To disable this requirement, ensure this check box is deselected.
8. Ensure the **Required numbers** check box is selected to enable the requirement of having at least one integer in the administrator password. This is enabled by default. This check box is enabled by default. To disable this requirement, ensure this check box is deselected.
9. Ensure the **Require special characters** check box is selected to enable the requirement of having at least one special character (!@#\$%^&*(){}[]) in the administrator password. This check box is enabled by default. To disable this requirement, ensure this check box is deselected.

10. In the **Maximum number of login tries** box, enter the maximum number of unsuccessful login attempts before disabling access for a set interval of time. The login page for the CCKM Admin Portal becomes inoperable and ignores further login attempts by an administrator for the specified interval. The range is between 1 and 10. The default number is 3.
11. In the **User lockout time (minutes)** box, enter the number of minutes to wait before allowing administrators to login. The default is 30 minutes
12. In the **Auth token validity duration (minutes)** box, enter the number of days in which the admin authentication token expires. The authentication token expiration interval is applied globally to each administrator account. If the administrator does not change the token prior to the expiration, the administrator must reset the password immediately the next time the administrator logs in. The expiration interval is an integer between 5 and 60. The default is 60.
13. Click **Submit**.

Chapter 13: CCKM for AWS Key Management

Overview	89
Prerequisites on AWS	90
Access AWS Key Management	91
Access CCKM for AWS	91
AWS CCKM User Portal	91
Home	93
Keys	93
Reports	106
Schedules	107
Logs	110
Key Sources	111
Settings	113

Overview

CCKM for AWS offers risk management and assessment of AWS customer-managed Customer Master Keys (CMKs) across AWS services. It provides operational visibility of AWS CMKs across AWS services, as well as tools to manage the complete life cycle of keys from on premise or from the cloud.

CCKM for AWS Key Management involves a few concepts specific to AWS:

- **Source key:** Source keys are generated from the supported CCKM key sources (CipherTrust Manager, DSM, or nShield Connect) and can be uploaded to AWS.
- **AWS regions:** Source keys can be uploaded to only one AWS region (chosen from a drop-down menu).
- **Customer Master Key (CMK):** There are two types of CMKs—AWS-managed or customer-managed. The CMK origin can be AWS_KMS (generated in KMS), or EXTERNAL (imported by user). CCKM can manage the life cycle of all keys, but owns the key material of only EXTERNAL keys imported by CCKM itself. CMKs are region-specific, meaning CMK operations and APIs work on CMKs in only one region at a time.
- CMKs can be disabled and enabled. CMKs cannot be deleted immediately, but can be scheduled for deletion 7 to 30 days in advance. CMKs can be identified by Key Id, Key ARN, or alias.
- **Alias:** Use a reader-friendly alias when uploading a source key to AWS to make searching for key names more intuitive. Multiple aliases can be assigned to the same CMK.

- **Delete key:** Unlike some other key management cloud services, the AWS CMK APIs do not provide a direct mechanism for creating backup keys. Therefore, the process of key deletion in the CCKM has several phases.
 - A source key that has been generated in a key source (CipherTrust Manager, DSM, or nShield Connect) but not uploaded or used in AWS, can be deleted from the **Key Sources** page by clicking **Delete Key**.
 - Once a source key has been uploaded to AWS, deleting it will only remove it from the **Key Sources** page, but not delete it from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as the key source). CCKM will keep the key in CipherTrust Manager, DSM or MongoDB (depending on the key source you are using) as a backup. For the uploaded AWS key, you can do **“Delete > Delete Key Material Now”** to remove the key material from AWS, and then later do **“Import”** to re-import (restore) the key material in AWS.

After a source key has been uploaded to AWS, to delete it from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as the key source), you must delete both the key uploaded to AWS and the key from the **Key Sources** page. First, schedule a deletion of the uploaded AWS key. After the AWS key is deleted on AWS, synchronize your keys on CCKM. Then delete the source key from the **Key Sources** page.

- **CMK key rotation:** The rotation of CMKs is encouraged as part of cryptographic best practices. Note that CCKM supports key rotation for keys that have an alias regardless whether it is a CCKM key or a native key. In CCKM, key rotation involves creating and uploading new external CMK and moving the alias(es) from the old (previous key) to this newly uploaded key (current key). This key rotation does not affect the components of the current CMK, such as the key ID, key ARN, and region.

CCKM allows for a manual or a scheduled rotation of a CMK. Scheduled rotation requires that the key rotation feature be configured in the **Settings** page within CCKM prior to enabling this feature in the **Rotate AWS Key** page.

Prerequisites on AWS

You must have:

- KMSFullAccess
- IAM GetUser permissions
- CloudWatch Logs permissions (Limited: List, Read All Resources)

Access AWS Key Management

You can either enter your AWS secret key ID and access key when prompted, or upload an AWS credentials file on the login page. AWS Credentials file should be .json format (can be written in notepad and saved for upload).

For example:

```
{  
  "aws_access_key_id": "ABCDEFGH1234hiJKLMN",  
  "aws_secret_access_key": "fgreg1234567tg\refg35"  
}
```

Access CCKM for AWS

For details about accessing CCKM as a CCKM user for the CCKM service for AWS Key Management, see [Chapter 3: "About CCKM Admin and User Portals" on page 27](#). This chapter includes information on the ways in which to access the CCKM service for Key Management.

AWS CCKM User Portal

The CCKM User Portal for AWS contains the following menu options in the left-hand navigation bar:

- **Home:** Home page displays key operation and count metrics.
- **Keys:** Keys page displays key management overview and provides the Upload and Synchronize functionality, and the Delete, Restore, and Auto Rotate key operations available in CCKM.
- **Reports:** All Reports overview page links to detailed individual reports.
- **Schedule:** In Schedule, you can schedule automatic key rotation, key rotation based on key expiration, and key synchronization.
- **Logs:** Logs page lists individual logs that can be searched, sorted, and viewed.
- **Key Sources:** In **Key Sources**, you can generate keys in CCKM to upload to AWS. CCKM provides support for the use of CipherTrust Manager and DSM as key sources to generate, store, and retrieve the encryption keys that CCKM uses and manages. CCKM also provides support for the use of nShield Connect HSM as a key source to generate the encryption keys that CCKM uses and manages. These keys are then stored in MongoDB. Also supported in **Key Sources** for all Azure clouds are BYOK and PFX file upload.

Note: CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

- **Settings:** The **Settings** page allows you to add the email addresses of the recipients who are to receive email notifications and configure the settings for email notifications, remote syslog server, and proxy server. You can also view the release number of the CCKM running from this page.

To display the context of which Key Management service you are currently logged into within CCKM, the icon associated with the Key Management service displays at the top of the left-hand navigation bar.

The arrow button at the bottom of the navigation bar allows you to expand the bar to view the names of the menu options and collapse it to view only the icons associated with the menu options. Click the arrow button to either expand or collapse the navigation bar.

On the top-right side of the CCKM portal for AWS, the following options are available:

- **Azure Cloud Service Context Switcher:** This context switcher allows you to login into another Azure cloud service different from the current Azure cloud service into which you are currently logged. If you select the Azure cloud in which you are currently logged, the Multi-account Login/Logout window for the Azure account(s) displays. For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **AWS Login:** If you are not already logged into AWS, clicking on the AWS Login icon brings you to the AWS Password Login page where you can enter your AWS credentials to access the CCKM AWS cloud service (from the current cloud service in which you are currently logged). If you are already logged into AWS, clicking on the AWS Login icon brings you to the Multi-account Login/Logout window for the AWS account(s). For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **Google Cloud Service Context Switcher:** This context switcher allows you to login into another Google Cloud organization different from the current Google Cloud organization into which you are currently logged. If you select the Google Cloud in which you are currently logged, the **Multi-account Login/Logout** window for the Google account(s) displays. For more information about the **Multi-account Login/Logout** window, see ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **Salesforce Cloud Service Context Switcher:** This context switcher allows you to login into another Salesforce cloud service different from the current Salesforce cloud service into which you are currently logged. This is Salesforce, Salesforce Government, or Salesforce Sandbox. If you select the Salesforce cloud in which you are currently logged, the Multi-account Login/Logout window for the Salesforce account(s) displays. For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple](#)

[accounts or Multiple Users per Cloud Service in CCKM UI" on page 32.](#)

- **Logout:** Logout from CCKM.

Home

The **Home** page provides a dashboard to display key operation and count metrics.

Keys

The **AWS Keys** page allows Cloud administrators to view all of the keys and manage them within the boundary of granted permissions. The keys or key vaults that do not have List permission for the respective Cloud administrator are not listed.

At the top right of the **Keys** page, the following buttons are available:

- **Export Keys:** Allows you to export the contents of the Keys list into a report in a CSV format.
- **Alias View:** Allows you to view the Keys list by the key alias names.
- **New Key:** Allows you to upload an external key (BYOK) or create a native key.
- **Synchronize:** Allows you to download any keys that were created in AWS, outside of the CCKM portal, into CCKM.

In this section, how to create, delete, schedule delete, import, update, rotate, synchronize, and export AWS keys are described. Also described in this section is how to download a public key of an AWS asymmetric key.

You can view the **AWS Keys** page by the **Keys** view or the **Alias** view. Here is the **Keys** view with **Key ID** as the first column.

To view the **AWS Keys** page by the **Alias** view, click **Alias View**. Any alias you assigned to the source keys when uploading these keys to AWS is shown in the Alias column, the first column listed within this view.

A **Search** box is available at the top the **AWS Keys** page allowing for a search of a specific key by entering any one of the following parameters:

- **Key ID:** The globally unique identifier for the CMK.
- **Source Key:** The name of the source key. This is the key generated in the key source you are using (CipherTrust Manager, DSM, or nShield Connect).
- **Region:** The AWS Region to which the key is uploaded.
- **Key Type:** The supported CMK key types are Symmetric and Asymmetric. Each key type has its relevant key usage(s) and key spec option(s).
- **Key Usage:** The cryptographic operations for which the CMK is used. The valid values are ENCRYPT_DECRYPT and SIGN_VERIFY. The Symmetric key type uses ENCRYPT_DECRYPT. The Asymmetric key type uses either ENCRYPT_DECRYPT or SIGN_VERIFY.
- **Key Spec:** A CMK property that represents the cryptographic configuration of a given CMK. Supported key specs are SYMMETRIC_DEFAULT, RSA, and elliptic curve (ECC). The Symmetric key type uses SYMMETRIC_DEFAULT. The Asymmetric key type uses either RSA or ECC.
- **ARN:** Amazon Resource Name of the CMK.
- **ARN description:** The description given to the CMK's ARN.

- **Origin:** The source of the key material. The valid values are:
 - **AWS_KMS:** Key material was created by AWS KMS.
 - **EXTERNAL:** Key material was imported from CCKM or another key management system.
- **Key Manager:** The manager of the CMK. The valid values are:
 - **AWS:** AWS-managed CMK.
 - **CUSTOMER:** Customer-managed CMKs that you create, use, and manage.
- **Key State:** The state of the CMK. The valid values are:
 - Enabled
 - Disabled
 - PendingDeletion
 - PendingImport
- **Expiration Model:** Specifies whether the key material of the CMK expires. This value is present only when the source of the key material was imported from CCKM or another key management system. The valid values are:
 - **KEY_MATERIAL_EXPIRES**
 - **KEY_MATERIAL_DOES_NOT_EXPIRE**
- **Tags:** The label assigned to the key, which consists of a customer-defined key and an optional value. For example, department finance.
- **Key Aliases:** The alias or aliases assigned to the key.

The **Advanced** tab allows you to filter your search on the each of the columns displayed on the **AWS Keys** page (with the exception of the **Action** column) and **Tags**.

- Key ID
- Region
- Key Type
- Key Usage
- Key Spec
- Creation Date—Enter START DATE and END DATE.
- Enabled—Available options from the drop-down menu are ENABLED and DISABLED.
- Key State—Available options from the drop-down menu are Enabled, Disabled, PendingImport, PendingDeletion
- Scheduled Deletion Date—Select a START DATE and END DATE.
- Key Material Expiration Date—Select a START DATE and END DATE.
- Key Material Origin
- Rotation Status—Available options from the drop-down menu are ACTIVE and ARCHIVED.
- Tags

Each of the columns are described in more detail below in this section.

To select to filter based on a specific column from the **AWS Keys** page, click **Advanced**. The **Filters** section displays. From the column filter drop-down menu, select the name of the column on which to filter your search. For example, select **Region**. In the **Search** box, enter the value on which to search (for example, **US East (Ohio)** as the region name) and click **Add**. For the **Enabled**, **Key State**, and **Rotation Status** columns, a drop-down menu is available from which to select a value for the search. Click the **down** arrow, select a value from the available options, and then click **Add**. For the **Creation Date**, **Scheduled Deletion Date**, and **Key Material Expiration Date**, select a start and end date for the search and then click **Add**. The specified search filter is then added to **Active Filters**. In the example, **Region: US East (Ohio)** is added to **Active Filters**. The results of the search displays in the **AWS Keys** table. You can narrow your search by selecting more columns to add to the filter. To clear the filtered results, from **Active Filters**, click on the “X” (or the **Delete** button) for each of the named filters.

The following columns display on the AWS Keys page:

- **Key ID:** The globally unique identifier for the CMK.
- **Region:** The AWS Region to which the key is uploaded.
- **Key Type:** The supported CMK key types are Symmetric and Asymmetric. Each key type has its relevant key usage(s) and key spec option(s).
- **Key Usage:** The cryptographic operations for which the CMK is used. The valid values are ENCRYPT_DECRYPT and SIGN_VERIFY. The Symmetric key type uses ENCRYPT_DECRYPT. The Asymmetric key type uses either ENCRYPT_DECRYPT or SIGN_VERIFY.
- **Key Spec:** A CMK property that represents the cryptographic configuration of a given CMK. Supported key specs are SYMMETRIC_DEFAULT, RSA, and elliptic curve (ECC). The Symmetric key type uses SYMMETRIC_DEFAULT. The Asymmetric key type uses either RSA or ECC.
- **Creation Date:** Indicates the date on which the key was created.
- **Enabled:** Indicates whether the key is enabled for use.
- **Key State:** The state of the CMK. The valid values are:
 - Enabled
 - Disabled
 - PendingDeletion
 - PendingImport

- **Scheduled Deletion Date:** Indicates the date on which the key is scheduled to be deleted.
- **Key Material Expiration Date:** Indicates the date on which the key material is set to expire.
- **Key Material Origin:**
 - If the key was uploaded from CCKM, then the value is INTERNAL(<source_key_name>).
 - If the key was not uploaded from CCKM as a BYOK key, then the value is EXTERNAL.
 - If the key material was created by AWS KMS, then the value is KMS.
- **Rotation Status:** Indicates whether the key is in active rotation schedule or if it has been rotated in the past.
 - Auto—if the autorotation is currently enabled.
 - Active—if the key is the most latest in the rotation sequence.
 - Archived—if the key has been rotated out.
- **Actions:** Allows you to select any of the following actions on a given key:
 - Rotate
 - Delete
 - Schedule Delete
 - Cancel Schedule Delete
 - Import
 - Update
 - Download Public Key

Create a Key

You have two options to create a new key in AWS KMS using CCKM:

- ["Create a Native Key" below](#)
- ["Upload your Own Key \(BYOK\)" on page 98](#)

Part of the process of creating a new key in AWS KMS using CCKM with either option is adding it to a AWS region and selecting a key type of symmetric or asymmetric to use. Each key type is associated with a key usage and key spec options.

The following are the supported key usages and key specs in AWS KMS:

- ENCRYPT_DECRYPT: used for Symmetric encryption. The supported key spec is SYMMETRIC_DEFAULT.
- ENCRYPT_DECRYPT: used for Asymmetric encryption. The supported key spec is RSA.
- SIGN_VERIFY: used for Asymmetric signing. The supported key specs are RSA and elliptic curve (ECC).

Create a Native Key

Create a native key in AWS KMS using CCKM. After CCKM creates a native key, it displays the key as **KMS** under the **Key Material Origin** column within the **Keys** page in CCKM.

For more information, see the following sections:

- ["Create a Native Key \(Asymmetric Key\)" on the facing page](#)
- ["Create a Native Key \(Symmetric Key\)" on the facing page](#)

Create a Native Key (Asymmetric Key)

To create a native key that has a key type of Asymmetric used for asymmetric signing or asymmetric encryption:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, select the **New Key** button and then **Create**. The **Create Key** dialog box displays.
3. From the **Region** box, select the AWS Region to which you will add the new key.
4. From **Key Type**, select the key type of **Asymmetric**.
5. From **Key Usage**, select **Encrypt and decrypt** if you will use this key to encrypt and decrypt data. Select **Sign and verify** if you will use this key to sign and verify data.
6. If you selected **Encrypt and decrypt**, then select **RSA_2048**, **RSA_3072**, or **RSA_4096** from the **Key Spec** box for the key spec to apply to the new key.
If you selected **Sign and verify**, then select **RSA_2048**, **RSA_3072**, **RSA_4096**, **ECC_NIST_P256**, **ECC_NIST_P384**, **ECC_NIST_P521**, or **ECC_SECG_P256K1** from the **Key Spec** box for the key spec to apply to the new key.
7. In the **Alias** box, assign an alias for intuitive key name searching and for use in key rotation. Required by AWS Management Console.

Note: In order to rotate keys, you must assign an alias when creating, uploading, or updating a key.

8. (Optional) In the **Description** box, enter a description of the key.
9. (Optional) In the **Tags** boxes, enter the tag name and value of the key and then click the **+** button.
10. (Optional) In the **Allow Access for External Accounts** box, enter the account ID of an external AWS account with which the key is shared and then click the **+** button. This step is applicable only if you are to share this key with an external AWS account.
11. Click **Create**.
The new key is displayed in the list.

Create a Native Key (Symmetric Key)

To create a native key that has a key type of Symmetric used for symmetric encryption/decryption:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, select the **New Key** button and then **Create**. The **Create Key** dialog box displays.
3. From the **Region** box, select the AWS Region to which you will add the new key.
4. From **Key Type**, select the CM key type of **Symmetric**.
The **Key Usage** of **Encrypt and decrypt** and **Key Spec** of **SYMMETRIC_DEFAULT** display and are not available for modification.
5. In the **Alias** box, assign an alias for intuitive key name searching and for use in key rotation. Required by AWS Management Console.

Note: In order to rotate keys, you must assign an alias when creating, uploading, or updating a key.

6. (Optional) In the **Description** box, enter a description of the key.
7. (Optional) In the **Tags** boxes, enter the tag name and value of the key and then click the **+** button.

8. (Optional) In the **Allow Access for External Accounts** box, enter the account ID of an external AWS account with which the key is shared and then click the **+** button. This step is applicable only if you are to share this key with an external AWS account.
9. Click **Create**.
The new key is displayed in the list.

Upload your Own Key (BYOK)

Upload the keys created from the **Key Sources** page of CCKM to the AWS KMS. These are the keys (of algorithm type AES256) you generated from the key source you are using (CipherTrust Manager or DSM). These are your "BYOK" keys.

To upload your BYOK to CCKM:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **All Keys** list page, select the **New** button and then **Upload**. The **Upload a Key** dialog box displays.
3. From the **Region** box, select the AWS Region to which you will upload the key.
4. From the **Key Provider** box, select **CipherTrust Manager**, **DSM**, or **nShield** depending on the key source you are using for the key.
5. From the **Source Key** box, select one of the available source keys. The keys available in the drop-down menu are the keys generated from CipherTrust Manager, DSM, or nShield Connect depending on the key source you are using.
6. In the **Alias** box, assign an alias for intuitive key name searching and for use in key rotation. Required by AWS Management Console.

Note: In order to rotate keys, you must assign an alias, when either uploading or using the Update Key function.

7. (Optional) Enter the expiration date of the key material in the **Key Material Expiration Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
8. (Optional) In the **Description** box, enter a description for the key you are uploading.
9. (Optional) In the **Tags** boxes, enter the tag name and value of the key and then click the **+** button.
10. (Optional) In the **Allow Access for External Accounts** box, enter the account ID of an external AWS account with which the key is shared and then click the **+** button. This step is applicable only if you are to share this key with an external AWS account.
11. Click **Upload to AWS**.
The uploaded key is displayed in the list.

Delete a Key

You have the following options to delete a key:

- Delete a BYOK
- Schedule Delete a BYOK or Native key

Delete a BYOK

You can delete a BYOK created from your key source and uploaded to AWS. These keys display as **EXTERNAL** under the **Key Material Origin** column on the **Keys** page. From the **Keys** page, deleting your BYOK deletes it from AWS. AWS requires a minimum wait period of seven days before it fully deletes the entire key from AWS.

To delete a BYOK (external key) from AWS:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **All Keys** list page, find the key you wish to delete.
3. From the **Actions** column, click **Delete**. The **Delete AWS Key Material** dialog box displays.
A warning message displays indicating that this action will delete AWS CMK "key ID" from AWS Key Management Service. The message also indicates to type the confirmation phrase (I wish to delete the key material from AWS KMS) in the text box if you wish to delete the key.
4. Type or copy/paste the confirmation phrase in the Warning box.
5. Click **Delete**.

Schedule Delete

From the **Keys** page, you have the option to schedule to delete a key from AWS KMS permanently after the designated pending period of seven to 30 days is reached. During key deletion, the key material and metadata will be deleted simultaneously from AWS KMS. **After the key is deleted, it cannot be restored, and the data encrypted with this key cannot be decrypted.** During the pending period, you have the option to cancel the scheduled key deletion using the **Cancel Delete** option from the **Action** column.

Schedule Delete Key

To schedule to delete a key from AWS KMS:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. Find the row that holds the key you wish to schedule to delete.
3. From the **Actions** column, click **Schedule Delete**. The **Schedule delete AWS Key** dialog box displays. A warning message displays in the dialog box indicating that this action will delete AWS CMK "<key ID>" from AWS Key Management Service. A message also indicates to type the confirmation phrase (I wish to delete the key, and I understand it cannot be restored) in the text box, if you still wish to delete the key.
4. In **Schedule to delete key after < > days**, enter a number between **7** and **30**, which is the number of days (designated pending period) after which the key is deleted.
5. Type or copy/paste the confirmation phrase in the dialog box.
6. Click **Delete**.

Import a Key

See ["Delete a Key" on the previous page](#). If the source key originated in CCKM and the key material has been deleted from AWS but the full deletion has not completed, use **Import** to re-import the key from CCKM to AWS.

Update Key

Use **Update** to do the following:

- Create and/or assign an alias to a key.
- Adjust the Enabled status, Description, or Tags.
- Add the account ID of an external AWS account with which the key is shared.
- Add an AWS key policy used to share the key with an external AWS account.

Note

Keys cannot be updated when they are in a PendingImport or PendingDeletion state.

To update a key:

1. On the **Keys** list page (Keys View or Alias View), click **Update** in the **Action** column for a particular key.
2. From the **Key Properties** tab, select an available alias or enter a new alias name in the **Alias** dialog. Click **+**.
3. Adjust the **Enabled** check box, **Description**, or **Tags**.
4. Click **Update**.
5. (Optional) From the **Key Policy** tab, in **Default View**, in **Allow Access for External Accounts**, click **+** and enter the account ID of an external AWS account with which the key is shared. This step is applicable only if you are to share this key with an external AWS account and you have not yet customized the AWS key policy.
You also have the option to enter an AWS key policy that allows you to share this key with an external AWS account. From the **Key Policy** tab, within **Key Policy** in **Policy View**, enter the AWS key policy copied from the associated JSON file.
6. Click **Save Accounts**.

Download Public Key (Asymmetric Key Only)

CCKM provides support for downloading a public key of an AWS asymmetric key for the asymmetric encryption and signing operations. The public key is made available in a Privacy Enhanced Mail (PEM) file format. The default file name is Publickey-<Key ID>.pem where <Key ID> is the key ID of the asymmetric key.

To download the public key of an AWS asymmetric key within CCKM:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. Find the row that holds the asymmetric key for which you wish to download the public key.
3. Select **Download Public Key** from the **Actions** drop-down menu.
The public key file is downloaded to the **Downloads** directory within your laptop or desktop.

Note: Save the file to a secure location after it is downloaded.

Rotate Key

CCKM allows key rotation for keys that have a key alias. When you rotate a key, CCKM uploads a new source key to AWS and moves the alias from this key to the new AWS key. After key rotation, all your applications that are using this key by its alias will use the new key to encrypt future data. To decrypt existing encrypted data, these applications continue to use the old key.

To rotate a key, select the **Rotate Key** action from the **Actions** column of the **All Keys** list. In the **Rotate AWS Key** dialog box, you can choose to **Rotate Now** or **Auto Rotate**.

Rotate Now allows you upload a source key to AWS immediately and move the key alias from this key to the new key. Note that you can only choose a new source key that is **not** in the rotation chain.

Auto Rotate allows you to rotate this key using a schedule of your choice. You must already have created a KEY_ROTATION schedule before you can select an autorotation of a key using **Auto Rotate**. See ["Schedule Key Rotation" on page 107](#) for more information about creating a schedule for the key autorotation. With **Auto Rotate**, CCKM will generate a new key in your key source, upload it to AWS, and then move the key alias from this key to the new key.

Note

Any key that is shared among different IAM users within a single AWS account and is scheduled for autorotation by one IAM user cannot be scheduled for autorotation again by another IAM user. Any key that is scheduled for autorotation displays the status of "AUTO" within the **Rotation Status** column of the **Keys** page. If you attempt to schedule autorotation using **Rotate Key** within the **All Keys** list with a key already scheduled, a message displays indicating that the key is already scheduled for rotation with the scheduled interval, date, and time at which the rotation is to take place. In addition, the name of the user responsible for scheduling the rotation displays.

For more information, see the following sections:

- ["Manually Rotate a Key \(Symmetric Key\)" below](#)
- ["Enable Autorotation of Key \(Symmetric Key\)" on the next page](#)
- ["Manually Rotate a Key \(Asymmetric Key, Encrypt, and Decrypt\)" on the next page](#)
- ["Manually Rotate a Key \(Asymmetric Key, Sign, and Verify\)" on page 103](#)
- ["Enable Autorotation of Key \(Asymmetric Key, Encrypt, and Decrypt\)" on page 103](#)
- ["Enable Autorotation of Key \(Asymmetric Key, Sign, and Verify\)" on page 104](#)

Manually Rotate a Key (Symmetric Key)

To manually rotate a symmetric key:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, choose the **Alias** or **Keys** view.
3. Find the row that holds the key you wish to rotate and select **Rotate Key** from the **Actions** column. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Rotate Now** tab.
5. From **Key Provider** box, select **CipherTrust Manager**, **DSM**, or **nShield** depending on the key source you are using for the key.
6. From the **Source Key** list, select a new source key.
Only source keys that have not yet been uploaded to AWS are listed. The **Aliases** box displays the alias associated with the selected key.
7. Deselect the **Disable Encrypt permission on Current key** check box, if you want to continue using the key that has been rotated out to encrypt new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to encrypt new data. Strictly maintain the rotated-out key so that KMS can continue using it to decrypt the previously encrypted data by that key.

8. (Optional) Select the **Key Material Expiration Date** check box to select a date and time on which the key material is set to expire. Select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers.
9. (Optional) Enter a description of the new CMK key in the **Description** box.
10. Click **Rotate**.

Enable Autorotation of Key (Symmetric Key)

To enable autorotation of a symmetric key:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, choose **Alias** or **Keys** view.
3. Find the name of the key for which to enable autorotation and select **Rotate Key** from the Actions drop-down menu. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Auto Rotate** tab.

Note: The **Enable autorotation on this key?** toggle and **Schedule** drop-down menu are not applicable to enabling autorotation of this key before it expires.

5. From the **Key Provider** box, select **CipherTrust Manager**, **DSM**, or **nShield** depending on the key source you are using for the key.
6. Deselect the **Disable Encrypt permission on Current key** check box, if you want to continue using the key that has been rotated out to encrypt new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to encrypt new data. Strictly maintain the rotated-out key so that KMS can continue using it to decrypt the previously encrypted data by that key.
7. Click **Submit**.

Manually Rotate a Key (Asymmetric Key, Encrypt, and Decrypt)

To manually rotate an asymmetric key used to encrypt and decrypt data:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, choose the **Alias** or **Keys** view.
3. Find the row that holds the key you wish to rotate and select **Rotate Key** from the **Actions** column. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Rotate Now** tab. The **Aliases** box displays the alias associated with the selected key.
5. Deselect the **Disable Encrypt permission on Current key** check box, if you want to continue using the key that has been rotated out to encrypt new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to encrypt new data. Strictly maintain the rotated-out key so that AWS KMS can continue using it to decrypt the previously encrypted data by that key.
6. Deselect the **Disable download permission on current public key** check box, if you wish to make available the option to download a public key for the given asymmetric key (by making available the **Download Public Key** option from the **Actions** drop-down menu). By default, this check box is selected. Best practice is to disable the download permission on the current public key.
7. (Optional) Select the **Key Material Expiration Date** check box to select a date and time on which the key material is set to expire. Select a start date and time from a date and time selector by clicking the calendar

button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers.

8. (Optional) Enter a description of the new CMK key in the **Description** box.
9. Click **Rotate**.

Manually Rotate a Key (Asymmetric Key, Sign, and Verify)

To manually rotate an asymmetric key used to sign and verify data:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, choose the **Alias** or **Keys** view.
3. Find the row that holds the key you wish to rotate and select **Rotate Key** from the **Actions** column. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Rotate Now** tab. The **Aliases** box displays the alias associated with the selected key.
5. Deselect the **Disable sign permission on current key** check box, if you want to continue using the key that has been rotated out to sign and verify new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to sign and verify new data.
6. (Optional) Select the **Key Material Expiration Date** check box to select a date and time on which the key material is set to expire. Select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers.
7. (Optional) Enter a description of the new CMK key in the **Description** box.
8. Click **Rotate**.

Enable Autorotation of Key (Asymmetric Key, Encrypt, and Decrypt)

To enable autorotation of an asymmetric key used to encrypt and decrypt data:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, choose **Alias** or **Keys** view.
3. Find the name of the key for which to enable autorotation and select **Rotate Key** from the **Actions** drop-down menu. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Auto Rotate** tab.
5. From **Enable autorotation on this key?**, select **On** to enable the autorotation of this key. By default, this toggle is initially set to **Off**.

Note: If the toggle for **Enable autorotation on key expiration?** is displayed, skip it. This option displays only if the key has an expiration date associated with it. This option is not applicable to enabling autorotation of the key.

6. From the **Schedule** drop-down menu, select a rotation schedule to which to apply to this key. Any key-rotation schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.
7. Deselect the **Disable Encrypt permission on Current key** check box, if you want to continue using the key that has been rotated out to encrypt new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to encrypt new data. Strictly maintain the rotated-out key so that KMS can continue using it to decrypt the previously encrypted data by that key.

8. Deselect the **Disable download permission on current public key** check box, if you wish to make available the option to download a public key for the given asymmetric key (by making available the **Download Public Key** option from the **Actions** drop-down menu). By default, this check box is selected. Best practice is to disable the download permission on the current public key.
9. Click **Submit**.

Enable Autorotation of Key (Asymmetric Key, Sign, and Verify)

To enable autorotation of an asymmetric key used to sign and verify data:

1. In the CCKM portal, in the left navigation bar, select **Keys**. The **Keys** page displays.
2. From the **Keys** page, choose **Alias** or **Keys** view.
3. Find the name of the key for which to enable autorotation and select **Rotate Key** from the **Actions** drop-down menu. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Auto Rotate** tab.
5. From **Enable autorotation on this key?**, select **On** to enable the autorotation of this key. By default, this toggle is initially set to **Off**.

Note: If the toggle for **Enable autorotation on key expiration?** is displayed, skip it. This option displays only if the key has an expiration date associated with it. This option is not applicable to enabling autorotation of the key.

6. From the **Schedule** drop-down menu, select a rotation schedule to which to apply to this key. Any key-rotation schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.
7. Deselect the **Disable sign permission on current key** check box, if you want to continue using the key that has been rotated out to sign and verify new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to sign and verify new data.
8. Click **Submit**.

Synchronize Keys

The first login into the CCKM AWS automatically synchronizes keys from all AWS regions. If you make a key status change in AWS, you must synchronize to see the latest status in the CCKM GUI. If you schedule a key deletion, then after the designated time period has passed, CCKM will delete the key from AWS. You are then required to synchronize your keys from CCKM to remove this key permanently from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as your key source).

After selecting to synchronize your AWS keys within the selected region(s), the metadata (new or revised) of these keys are downloaded to CCKM.

You have the option to schedule key synchronization. Perform this scheduling in the **Schedules** page.

To synchronize your keys:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. Click **Synchronize**. The **Synchronize Key** dialog box displays.
3. Ensure the regions for which you wish to synchronize keys are included in the **Synchronize keys for regions** box. Remove any region whose keys you wish to **not** synchronize at this time by selecting the "X" next to the region name.
4. Click **Synchronize** to proceed with the synchronization.

Enable Autorotation before Key Expiration

To enable autorotation of a key before it expires, you must first set up a key-expiration schedule in the **Schedules** page. Once the key is enabled for autorotation, the key will be rotated before it expires. After the key is autorotated, the key will have a new expiration date based on the key-expiration schedule.

To enable autorotation of a key before it expires:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. Choose **Alias** or **Keys** view.
3. Find the name of the key for which to enable autorotation before key expiration and select **Rotate Key** from the Actions drop-down menu. The **Rotate AWS Key** dialog box is displayed.
4. Select the **Auto Rotate** tab.
5. From **Enable autorotation on key expiration?**, select **On** to enable the autorotation of this key before it expires. By default, this toggle is initially set to **Off**.

Note: Skip the **Enable autorotation on this key?** as it is not applicable to enabling autorotation of this key before it expires.

6. From the **Schedule** drop-down menu, select a key-expiration schedule to which to apply to this key. Any key-expiration schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.
7. From the **Key Provider** box, select **CipherTrust Manager**, **DSM**, or **nShield** depending on the key source you are using for the key.
8. Deselect the **Disable Encrypt permission on Current key** check box, if you want to continue using the key that has been rotated out to encrypt new data. By default, this check box is selected. Best practice is not to use the old key that has been rotated out to encrypt new data. Strictly maintain the rotated-out key so that KMS can continue using it to decrypt the previously encrypted data by that key.
9. Click **Submit**.

Export Keys

Export Keys allows you to export the contents of the **Keys** list into a report in a CSV format.

1. In the left navigation bar, click **Keys**.
2. Click **Export Keys**.

This will download all of the keys in a report in a CSV format.

Reports

It is necessary to set up the CloudTrail and CloudWatch services in AWS before AWS keys will be represented in the CCKM reports. You also have the option to set these services up in CCKM using the **General** tab in the **Settings** page. For more information, see ["Configure CloudTrail and CloudWatch in AWS to Use CCKM Reports" below](#).

Choose Reports in the left-hand navigation to access the following reports:

- **Combined Key Activity Reconciliation Report**

Click **Run Report** to generate a new list of events connected to a key.

- **Key Activity Report**

Illustrates the activity type performed by a specific user and at the stated time.

- **Key Service Usage Report**

Indicates the:

- Key name
- Origin: AWS KMS or External
- Requesting Service: Name or ID of the service using a key
- Region
- Request Timestamp: Time when the application used the key.

- **Key Aging Report**

Provides information about key expiration using the following columns:

- Key Name
- Region
- Scheduled key deletion date
- Key expiration: Date and time at which this key expires.

- **Cloud Key Manager User Action Report**

Lists the users and their actions in creating and deleting keys in the CCKM portal.

Configure CloudTrail and CloudWatch in AWS to Use CCKM Reports

CCKM uses AWS CloudTrail and CloudWatch services to generate reports.

Overview

AWS CloudTrail:

- Actions taken by a user, role, or an AWS service are recorded as events in CloudTrail.
- Actions performed on or by AWS KMS keys are also recorded in CloudTrail.
- CCKM uses these audit records to generate 'Key reconciliation report', 'Key service usage report' and 'Key activity report'.

AWS CloudWatch:

- CloudWatch allows the querying and filtering of CloudTrail logs through log groups.
- CCKM uses CloudWatch log group to fetch KMS audit logs and generate reports.

Configure CloudTrail

1. Log in the AWS Management Console.
2. **Important: Select any region. Note down this region.**
This region will be provided in the CCKM in the last steps.
3. Go to the **CloudTrail** section in **Management Tools**, select **Trail**, and click **Create Trail**. Create trail in CloudTrail with following settings:
 - a. Apply trail to all regions
 - b. 'Read/Write events' in Management events
 - c. Skip data events section.
 - d. Select any Storage location as per your convenience for logs collected by CloudTrail.

<https://docs.aws.amazon.com/awscloudtrail/latest/userguide/cloudtrail-create-and-update-a-trail.html>

Configure CloudWatch Log Group

Monitor the new trail using a CloudWatch log group.

1. Configure CloudWatch Logs to receive your logs from CloudTrail so that you can monitor for specific log events.
2. Edit trail created in the previous section.
3. Enter a new or existing CloudWatch log group name. **Note down this log group name.**

<https://docs.aws.amazon.com/awscloudtrail/latest/userguide/send-cloudtrail-events-to-cloudwatch-logs.html>

Schedules

The **Schedules** page allows Cloud administrators to view and schedule the following job types:

- Key Rotation
- Key Synchronization
- Key Expiration

CCKM provides support for multiple schedules for each of the job types.

At the top right of the **Schedules** page, the **Add Schedule** button is available from which to add a scheduled job type.

Schedule Key Rotation

CCKM provides support for multiple schedules of a rotation of an AWS key. A new version of the key is added to the AWS key during a scheduled key rotation. Scheduled rotation requires that this feature be configured in the **Schedules** page prior to enabling the feature in the **Auto Rotate Key** dialog box (from the **Actions** column of the **All Keys** list). Your AWS key credentials (AWS Access Key ID and AWS Secret Access Key) are required as part of the configuration and are saved to the key source you are using (CipherTrust Manager or DSM) or to MongoDB (if you are using nShield Connect as your key source). If you have both DSM and nShield Connect configured as your key sources, then your AWS key credentials are saved only to DSM where it is stored.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

During a scheduled rotation of a key, CCKM uses your associated AWS key credentials to rotate the key. If the AWS Secret Access Key expired or changed, then a new Secret Access Key must be reentered. Otherwise, the scheduled rotation will fail.

You can pause or delete a scheduled key rotation in the **Schedules** page. Note that when a key rotation schedule is deleted from CCKM, then the AWS key credentials are also deleted from the key source you are using (CipherTrust Manager or DSM) or from MongoDB (if you are using nShield Connect as your key source).

Set up a Key Rotation Schedule

1. In the CCKM portal, in the left navigation bar, select **Schedules**. The **Schedules** page displays.
2. On the **Schedules** page, select the **Add Schedule** button. The **Add Schedule** dialog box displays including your username in the **Username** box.
3. From the **Job Type** drop-down menu, select **KEY_ROTATION**.
4. In the **Name** box, enter the name of the schedule. Ensure this name is unique for this job type.
5. (Optional) Enter a description of the schedule in the **Description** box.
6. For **Pause**, select **No**.
7. For **Schedule**, set a schedule for the rotation by selecting **Basic** (to enter a date and interval for the schedule) or **Advanced** (to enter a Cron Expression for the schedule).

If you selected **Basic**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. Set the repeat interval of the key rotation by entering a number in **Repeat Interval** and then selecting Day, Week, or Month from the drop-down menu. The supported ranges are 1 through 30 days, 1 through 4 weeks, and 1 through 12 months. You can increase or decrease the number you enter.

If you selected **Advanced**, enter the cron expression in the **Cron Expression** box.
8. Enter your AWS key credentials in the **AWS Access Key ID** and **AWS Secret Access Key** boxes or click **Choose file** from **Upload Credentials** to upload an AWS credentials file that contains both the AWS Access Key ID and AWS Secret Access Key.
9. Click **Save**.

Pause a Key Rotation Schedule

To pause a key rotation schedule, select **Yes** for **Pause** within the **Add Schedule** dialog box and then click **Save**. The setting is saved. To resume the rotation schedule after pausing it, select **No** for **Pause** and then click **Save**. The setting is saved.

Delete a Key Rotation Schedule

To delete a key rotation schedule, select **Delete** from the **Actions** drop-down menu from the **Schedules** page. Note that the AWS key credentials (AWS Access Key ID and AWS Secret Access Key) associated with the given key rotation schedule are also deleted from the key source you are using (CipherTrust Manager or DSM) or from MongoDB (if you are using nShield Connect as your key source).

Schedule Key Synchronization

CCKM allows for multiple schedules of the synchronization of AWS keys. Synchronizing downloads any keys that were created in AWS, outside of the CCKM portal, into your CCKM. Scheduled key synchronization requires that this feature be configured in the **Schedules** page. You can also pause or delete a scheduled key synchronization in

the **Schedules** page. Note that when a key synchronization schedule is deleted from CCKM, then the AWS key credentials (AWS Access Key ID and AWS Secret Access Key) associated with the given key scheduled synchronization are also deleted from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as the key source). If you have both DSM and nShield Connect configured as your key sources, then the AWS key credentials are deleted from DSM where it is stored.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Set up a Key Synchronization Schedule

1. In the CCKM portal, in the left navigation bar, select **Schedules**. The **Schedules** page displays.
2. On the **Schedules** page, select the **Add Schedule** button. The **Add Schedule** dialog box displays including your username in the **Username** box.
3. From the **Job Type** drop-down menu, select **KEY_SYNCHRONIZATION**.
4. In the **Name** box, enter the name of the schedule. Ensure this name is unique for this job type.
5. (Optional) Enter a description of the schedule in the **Description** box.
6. For **Pause**, select **No**.
7. For **Schedule**, set a schedule for the rotation by selecting **Basic** (to enter a date and interval for the schedule) or **Advanced** (to enter a Cron Expression for the schedule).

If you selected **Basic**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. Set the repeat interval of the key rotation by entering a number in **Repeat Interval** and then selecting Day, Week, or Month from the drop-down menu. The supported ranges are 1 through 30 days, 1 through 4 weeks, and 1 through 12 months. You can increase or decrease the number you enter.

If you selected **Advanced**, enter the cron expression in the **Cron Expression** box.
8. Enter your AWS key credentials in the **AWS Access Key ID** and **AWS Secret Access Key** boxes or click **Choose file** from **Upload Credentials** to upload an AWS credentials file that contains both the AWS Access Key ID and AWS Secret Access Key.
9. Click **Save**.

Schedule Key Expiration

CCKM provides support for multiple schedules of the expiration of AWS keys in the **Schedules** page. You can also pause or delete a scheduled key expiration in the **Schedules** page. Note that when a key expiration schedule is deleted from CCKM, then the AWS key credentials (AWS Access Key ID and AWS Secret Access Key) are also deleted from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as your key source). If you have both DSM and nShield Connect configured as your key sources, then the AWS key credentials are deleted from DSM where it is stored.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Set up a Key Expiration Schedule

1. In the CCKM portal, in the left navigation bar, select **Schedules**. The **Schedules** page displays.
2. On the **Schedules** page, select the **Add Schedule** button. The **Add Schedule** dialog box displays including your username in the **Username** box.
3. From the **Job Type** drop-down menu, select **KEY_EXPIRATION**.
4. In the **Name** box, enter the name of the schedule. Ensure this name is unique for this job type.
5. (Optional) Enter a description of the schedule in the **Description** box.
6. For **Pause**, select **No**.
7. From **Start Date**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers.
8. From **Expire a new key after**, enter a number and select the interval unit of Hour, Day, Week, Month, or Year from the drop-down menu after which the new key expires. The supported ranges are 6 through 24 hours, 1 through 30 days, 1 through 4 weeks, and 1 through 12 months. You can increase or decrease the number you enter.
9. Enter your AWS key credentials in the **AWS Access Key ID** and **AWS Secret Access Key** boxes or click **Choose file** from **Upload Credentials** to upload an AWS credentials file that contains both the AWS Access Key ID and AWS Secret Access Key.
10. Click **Save**.

Logs

CCKM maintains logs for events, such as login, key generation, synchronizing of keys, and deletion of keys, and displays these logs in the **All Logs** list of the **Logs** page. For each logged event listed on the **Logs** page, the following information is displayed:

- Event name
- Severity level
- Date and time of the event
- Event message
- User (name) associated with the event

You can search for a specific logged event from the **Logs** page using the **Search** box. Allowable filters on the search are event name, severity level, event message, and user (name).

Key Sources

The **Key Sources** page displays **all** of the keys that were generated from the key source you are using. If you are logged into multiple clouds within CCKM, this page displays all of the keys from these clouds.

Three tabs are available at the top of the **Key Sources** page:

- **CipherTrust Manager Key:** Use this tab to use CipherTrust Manager as your key source. The keys are generated and stored within CipherTrust Manager.
- **DSM Key:** Use this tab to use DSM as your key source. The keys are generated and stored within DSM.
- **nShield Key:** Use this tab to use nShield Connect HSM as your key source. The keys are generated within nShield Connect and then stored as blobs within MongoDB.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Keys listed on the **Key Sources** page are listed by name, cloud ID, key type (the cloud in which this key is used), the algorithm of the key, the creation date of the key, key description and actions you can take regarding that key.

A **Search** box is available at the top left of the **Keys Sources** page allowing for a search of a specific key by entering any one of the following parameters:

- Name (key name)
- Cloud ID
- Key Type
- Algorithm
- Description
- Created By (a key created by a specific user)

Add (Generate) a Key

From the **Key Sources** page, you can add (or generate) keys in CCKM using CipherTrust Manager, DSM, or nShield Connect as a key source for *all* of the clouds into which you are currently logged.

Note

The key algorithm currently supported for an AWS key in CCKM is AES256.

Add (Generate) a CipherTrust Manager Key

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **CipherTrust Manager Key** tab.
3. Select **Add Key > AWS Key**.
4. In the **Add CipherTrust Manager Key** dialog box, select the name of the user of the key from the **User** drop-down menu. **Service** is fixed to **AWS** and (key) **Algorithm** is fixed to **AES256**.
5. In the **Name** box, enter the name of the new key.
6. Enter a description of the key in the **Description** box.
7. Click **Save** to save the new key to CCKM. The new key is added to the key list.
(Reset clears the screen before it has been saved.)

Add (Generate) a DSM Key

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **DSM Key** tab.
3. Select **Add Key > AWS Key**.
4. In the **Add DSM Key** dialog box, select the name of the user of the key from the **User** drop-down menu. **Service** is fixed to **AWS** and (key) **Algorithm** is fixed to **AES256**.
5. In the **Name** box, enter the name of the new key.
6. Enter a description of the key in the **Description** box.
7. Click **Save** to save the new key to CCKM. The new key is added to the key list.
(Reset clears the screen before it has been saved.)

Add (Generate) an nShield Key

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **nShield Key** tab.
3. Select **Add Key > AWS Key**.
4. In the **Add nShield Key** dialog box, select the name of the user of the key from the **User** drop-down menu. **Service** is fixed to **AWS** and (key) **Algorithm** is fixed to **AES256**.
5. In the **Name** box, enter the name of the new key.
6. Enter a description of the key in the **Description** box.
7. Click **Save** to save the new key to CCKM. The new key is added to the key list.
(Reset clears the screen before it has been saved.)

Delete a Key

Deleting a key from the **Key Sources** page deletes the key from CCKM. If you delete a key from **Key Sources** that has already been uploaded to AWS, the key will not be deleted from AWS.

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **DSM Key**, **CipherTrust Manager**, or **nShield Key** tab depending on the key source you used to generate this key.
3. Click **Delete** next to the target key.
4. The **Delete Key** dialog box with a Warning displays asking you to confirm the key deletion by entering the supplied phrase.
5. Enter or copy/paste the confirmation phrase.
6. Click **Delete**.

Manage keys in Key Sources List Page

In addition to adding and deleting keys, the **Key Sources** page allows you to sort the existing keys by Name, Key Type, Algorithm and Created Date.

Settings

To access the **Settings** page in CCKM, select **Settings** from the left-hand navigation bar. From the **Settings** page, you can:

- Enter the email addresses of the recipients who are to receive the email notifications.
- Enable email notifications to be sent out from CCKM when specific types of key actions are performed. For example, when a key is uploaded to the cloud service. You can also enable CCKM to send reminder notifications for when to rotate a key.
- Enable reporting for AWS keys using an existing AWS CloudTrail and CloudWatch log group or a new trail and log group that you create (from the **Settings** page).
- Configure a remote syslog or log server to which to send CCKM log data.
- View information about the software release number of the CCKM you are running including the build and version number.

Adding Recipients' Email Addresses (for Notifications)

Use the **General** tab from the **Settings** page to enter the email addresses of the recipients who are to receive email notifications from CCKM. Enter the recipients' email addresses separated by a comma in the **Notification Recipient** box and then click **Save** to save setting.

Enabling Notifications

Using the **Keys Notification** tab from the **Settings** page, you can configure CCKM to send an email notification when a key is deleted from AWS or restored or uploaded to AWS. You can also use this tab to configure CCKM to send a reminder notification for when to manually rotate a key along with the frequency (in days) at which a notification is sent. Add the email address(es) of the recipients in the **General** tab from the **Settings** page. By default, no notifications are sent.

To enable email notifications:

1. In the **Settings** page, select the **Keys Notification** tab.
2. Under **Notifications**, select **On** for each of the notifications you wish to enable:
 - Rotate AWS Key (reminder notification)
 - Delete AWS Key
 - Import AWS Key
 - Upload AWS Key
3. If you selected to enable **Rotate AWS Key**, in the **Days** box, enter the number of days for the frequency a reminder notification is sent.
4. Click **Save**.

Enabling Reporting for AWS Keys

Use the **General** tab within the **Settings** page to enable CCKM reporting for AWS keys using an existing AWS CloudTrail applicable to an AWS region and a CloudWatch log group to which the trail belongs. You can also use the **General** settings tab to create a new CloudTrail and CloudWatch log group to which the trail belongs. You first select an AWS region in which to create it and then add the name of a new CloudWatch log group. Thereafter, you configure the other required configurations.

Enabling Reporting for AWS Keys Using an Existing CloudTrail and CloudWatch Log Group

1. In the **Settings** page, select the **General** tab. The **General** page displays.
2. From the **Select CloudTrail Region** drop-down menu, select the AWS region to which the trail applies.
3. From the **Select CloudWatch Log Group Name** drop-down menu, select the name of the log group to which trail belongs.
4. Click **Save**.

Enabling Reporting for AWS Keys Using a New CloudTrail and CloudWatch Log Group

1. In the **Settings** page, select the **General** tab. The **General** page displays.
2. From the **Select CloudTrail Region** drop-down menu, select the AWS region in which to create the new trail.
3. From the **Select CloudWatch Log Group Name** drop-down menu, enter the name of the new CloudWatch Log Group to create. This log group receives your logs from CloudTrail so that you can monitor for specific log events. Entering a name of the new log group triggers the display of other configuration boxes associated with creating a new trail and log group.
4. From the **Stack Name** box, enter the name of the new stack to create. The AWS CloudFormation stack automates the creation of all resources required for creating a new trail (bucket, trail, and log group). If a resource fails, the stack rolls back to the previous version. From AWS CloudFormation, you can view information about any failure during the process of the creating the stack using the name of the stack. You can also delete the stack from CloudFormation without any impact to your AWS resources.
5. From the **S3 Bucket Name** box, enter the name of an S3 bucket to designate as the storage of the trail log files. The name must be globally unique. If you do not enter a bucket name, the default bucket name of **cckm-bucket** is used.
6. From the **Cloud Trail Name** box, enter the name of the new trail. If you do not enter a trail name, the default trail name of **cckm-bucket** is used.
7. From the **CCKM IAM Role Name** box, enter the name of the AWS IAM Role used for CCKM. If you enter an existing IAM role name, then CCKM uses this name to apply to the configuration. If you enter a new IAM Role name, CCKM creates this role with the required permissions to create the resources for the trail. If you do not enter an IAM role name for CCKM, the default role name of **AWS-*<region-name>*-cckm-cloudtrail-to-cloudwatch** is used.

Note: If you do not have the permissions to create a new IAM role, contact your AWS administrator to create the IAM role with permissions to create and delete log groups, trails and buckets.

8. Enter your AWS key credentials in the **AWS Access Key ID** and **AWS Secret Access Key** boxes or click **Choose file** from **Upload Credentials** to upload an AWS credentials file that contains both the AWS Access Key ID and AWS Secret Access Key.
9. Click **Save**.

Configuring Syslog Server

Note

In this document, the terms "syslog server" and "log server" are synonymous.

The **Syslog** tab from the **Settings** page allows you to configure the remote syslog or log server to which to send CCKM log data using TCP, TLS, or UDP protocol as the transport protocol. If you use the TLS protocol, then you are required to upload the syslog server certificate to CCKM for the TLS connection.

The **Syslog** tab also allows you to delete your syslog server configuration so that log data are no longer sent to the server.

Prior to configuring the setting for a remote syslog server, ensure that you have installed and configured the syslog server including configuring the setting for the port number the transport protocol will use to connect to CCKM. This port number configuration must match the port configuration you set in the **Syslog** tab of the **Settings** page.

Note

Support for both Syslog and Splunk as a remote syslog server is provided in CCKM. However, the use of a Splunk cloud server as a remote syslog server is currently not supported in CCKM.

Configure Remote Syslog Server

To configure a remote syslog server to which to send CCKM log data:

Note

The facility name of "LOCAL1" for the syslog server displays in the **Facility** box. This default value is not available for modification.

1. In the **Settings** page, select the **Syslog** tab. The **Syslog** dialog box displays.
2. In the **Hostname** box, enter the hostname or IP address of the syslog server.
3. In the **Port** box, enter the port number the transport protocol uses to connect to the syslog server. Enter a value between 1 and 65535. The default value is 514.
4. In the **Protocol** drop-down menu, select **TCP**, **TLS**, or **UDP** for the transport protocol to use when sending the log data to the syslog server. The default value is **UDP**. If you select **TCP**, proceed to Step 6. If you select **TLS**, proceed to the next step. Otherwise, proceed to Step 7.
5. In the **Certificate** box, select **Choose File** and then select the syslog server certificate to upload to CCKM.
6. Click **Test Connection** to test the connection between CCKM and the remote syslog server. This button is only available for use when either **TCP** or **TLS** is the selected transport protocol.
7. In the **Log Format** drop-down menu, select **CEF** (Common Event Format), **Plain Text**, or **RFC5424** for the format of the log message to use when sending the log data. The default value is **RFC5424**.
8. (Optional) In the **Description** box, enter a description of the remote syslog server.
9. Click **Save**.

Delete Remote Syslog Server Configuration

To delete the configuration of a remote syslog server:

1. In the **Settings** page, select the **Syslog** tab. The **Syslog** dialog box displays.
2. Click **Delete**. The **Delete Syslog** dialog box displays.
A warning message displays indicating that this action will delete the syslog settings from CCKM. The message also indicates to type the confirmation phrase (I wish to delete the syslog settings) in the text box if you still wish to delete the syslog settings.
3. Enter or copy/paste the confirmation phrase in the text box.
4. Click **Delete**.

About

Use the **About** tab to view the release number of the CCKM you are running.

Chapter 14: CCKM for Azure Key Management

Overview	117
Accessing and Managing Azure Resources	117
Registering Apps in Azure	118
Prerequisites on Azure	118
Access CCKM for Azure	118
Azure CCKM User Portal	120
Home	122
Azure Directory Context Switcher (Support for Guest User for AAD B2B Collaboration)	122
Keys	124
Reports	136
Schedules	137
Logs	140
Key Sources	141
Settings	143

Overview

CCKM provides support for Azure clouds (Azure, and Azure China). Note that in this chapter, the information regarding Azure is applicable to all Azure clouds unless otherwise noted. The CCKM UI for Azure, and Azure China is identical with the exception of the display of the names of the clouds.

Accessing and Managing Azure Resources

Note

This section is only applicable to Azure and Azure China.

Azure allows external applications, such as CCKM, to access and manage resources within Azure in the following ways:

- On behalf of a user
- As a service principal

Both ways require that the application be first registered in Azure. For applications on behalf of a user, it is required that the Azure users be created and given the appropriate access controls and policies on the resources. The application obtains an access token through app+user authenticate. What an application can do with the Azure resources depends on what the user can do.

For as-service-principal applications, the application must be given the appropriate access controls and policies on the resources. The application obtains an access token through an *app-only authentication*. What an application can do with Azure resources depends on whether the service principal has proper permissions on the resources.

Registering Apps in Azure

When registering apps in Azure, the following are the two types of app credentials employed:

- Secret (password)—The user will generate a secret key in Azure when registering the app, and then copy the secret key and provide it to the app. When making OAuth authentication calls, the app will send the secret key to Azure.
- Certificate (public key)—the user will create a private key and public key pair locally, create a certificate for the public key, and then provide the certificate to Azure when registering the app. For the private key, the app will create a client assertion and send it to Azure when making OAuth authentication calls.

CCKM currently supports both types of app credentials for Azure and Azure China.

Prerequisites on Azure

The Azure administrator must ensure the following prerequisites are met:

- Each Azure key vault must belong to an Azure Resource Group.
- Key vault owner must give designated users or the CCKM app (if CCKM is used as a service principal) the “Key Vault Contributor” role in Azure Access Control, and appropriate permissions as needed on keys in Access Policies.

Note: If CCKM is used as a service principal within a key vault, you have the option to use the Azure permission model of **Azure role-based access control** for the service principal under **Key vaults > Access policies**. Ensure to also give the service principal the role of “Key Vault Administrator” within the applicable key vault. For more information about Azure role-based access control, refer to the Azure online documentation.

Note: Changing key vault Access Control and/or Access Policies will not affect the active CCKM user sessions. To reflect the change, a user must re-log in to CCKM to establish a new user session.

- CCKM Reports draw on the Azure Log Analytics service, which must be pre-configured if the CCKM Reports functionality is desired (see “[Reports](#)” on page 136). At minimum, you must have:
 - An Azure *Log Analytics* service created and associated with the relevant key vaults.
 - In the *Log Analytics > {Log service name} > Access Control (IAM)* section of the Azure portal, set “**Log Analytics Contributor**” permissions for any user who should be able to generate reports in CCKM. Other users can view, but not create reports.

For more information about how to configure Log Analytics in Azure key vaults, see the latest version of the following Microsoft Azure documentation:

<https://docs.microsoft.com/en-us/azure/key-vault/general/howto-logging?tabs=azure-portal>

Access CCKM for Azure

This section describes the two ways in which to access the CCKM service for Azure Key Management:

- “[Accessing CCKM for Azure Using User Login](#)” on the facing page
- “[Accessing CCKM for Azure Using Service Principal](#)” on the facing page

Accessing CCKM for Azure Using User Login

For details about accessing CCKM as a CCKM user for the CCKM service for Azure Key Management, see [Chapter 3: "About CCKM Admin and User Portals" on page 27](#). This chapter includes information on the ways in which to access the CCKM service for Key Management.

Accessing CCKM for Azure Using Service Principal

Note

This section only applies to Azure and Azure China using CCKM as a service principal.

To access CCKM for Azure using CCKM as a service principal, the first time you log into CCKM as an administrator user, you are required to provide the administrator consent to grant permissions to the CCKM app to access your Azure resources (your organization data). *After* you click on the "Admin Consent" button, you are redirected to the Azure consent page where you can provide your consent (after reviewing the page) by clicking **Accept**.

As an administrator user, you can confirm that CCKM has been granted the permissions as a service principal *after* you have granted your administrator consent by logging into the Azure portal and verifying that the CCKM app is listed in the **Enterprise Applications > All Applications** page.

After you have granted these permissions, you can log into CCKM for Azure using CCKM as a service principal using your tenant credentials.

For more information, see the following sections:

- ["Granting Admin Consent First Time Accessing CCKM for Azure Using Service Principal" below](#)
- ["Accessing CCKM for Azure Using Service Principal \(After Granting Admin Consent\)" on the next page](#)

Granting Admin Consent First Time Accessing CCKM for Azure Using Service Principal

To access the CCKM service for Azure Key Management using CCKM as a service principal for the first time and grant your Admin consent:

1. Log into the CCKM Admin Portal as a CCKM administrator using your administrator credentials. The CCKM Admin Portal displays.
2. From the **Key Management** drop-down list at the top of the CCKM Admin Portal page, select **Azure | Azure China**. You are redirected to the CCKM login dialog box for Azure to use CCKM as a service principal. At the top of this dialog box, the following message displays:
"If this is your first time to use CCKM for managing your Azure keys, please click [here](#) to provide Admin Consent."
3. Select the "admin consent" link (indicated by "here" in blue text within the displayed message). The CCKM **Admin Consent: Azure** dialog box displays.
4. In the **Tenant Name** box, enter the tenant name. To locate your tenant name in the Azure portal (after logging in as an administrator user), go to **Azure Active Directory > properties > Tenant Name**.
5. In the **Tenant ID** box, enter the tenant ID. To locate your tenant ID in the Azure portal (after logging in as an administrator user), go to **Azure Active Directory > properties > Tenant ID**.
6. In the **Tenant Password** box, enter the tenant password. The other users will use this password along with their tenant name to login to the CCKM User Portal. The password must be at least 8 characters long and contain one upper case letter, one lower case letter, one digit, and one special character from a limited set of special characters "!@#%&^*()".

7. In the **Confirm Tenant Password** box, reenter the tenant password.
8. Select **Admin Consent** to provide your consent to Microsoft to grant permissions to the CCKM app. You are redirected to the Microsoft login page to select an account to use to login to your Azure AD. This account must be a user with "Application administrator" role in your Azure AD.
9. Enter your Azure Admin username and password. The Microsoft consent prompt displays.
10. Review the information and then click **Accept** to accept the request to grant permissions to the CCKM app to access your Azure resources as a service principal. You are then redirected to a CCKM page displaying a message indicating the given Azure tenant admin granted permissions to this CCKM application and that you can use your tenant name and password to login to CCKM.
11. Select the "**login to CCKM**" link. You are redirected to the CCKM user login page.
12. Select the Azure key management service you wish to use. You are redirected to the CCKM login dialog box for Azure to use CCKM as a service principal.
13. In the **Tenant Name** box, enter the tenant name.
14. In the **Tenant Password** box, enter the tenant password.
15. Click **Login**. The Azure CCKM dashboard displays.

Accessing CCKM for Azure Using Service Principal (After Granting Admin Consent)

To access the CCKM service for Azure Key Management using CCKM as a service principal *after* you have granted your Admin consent:

1. From the CCKM user login page, select the Azure key management service you wish to use. You are redirected to the CCKM login dialog box for Azure to use CCKM as a service principal.
2. In the **Tenant Name** box, enter the tenant name.
3. In the **Tenant Password** box, enter the tenant password.
4. Click **Login**. The Azure CCKM dashboard displays.

Azure CCKM User Portal

The CCKM User Portal for Azure contains the following menu options in the left-hand navigation bar:

- **Home:** Home page displays key operation and count metrics.
- **Keys:** Keys page displays key management overview and provides the Upload and Synchronize functionality, and the Delete, Restore, and Auto Rotate key operations available in CCKM.
- **Reports:** All Reports overview page links to detailed individual reports.
- **Schedule:** In Schedule, you can schedule automatic key rotation, key rotation based on key expiration, and key synchronization.
- **Logs:** Logs page lists individual logs that can be searched, sorted, and viewed.

- **Key Sources:** In **Key Sources**, you can generate keys in CCKM to upload to Azure. CCKM provides support for the use of CipherTrust Manager and DSM as key sources to generate, store, and retrieve the encryption keys that CCKM uses and manages. CCKM also provides support for the use of nShield Connect HSM as a key source to generate the encryption keys that CCKM uses and manages. These keys are then stored in MongoDB. Also supported in **Key Sources** for all Azure clouds are BYOK and PFX file upload.

Note: CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

- **Settings:** The **Settings** page allows you to add the email addresses of the recipients who are to receive email notifications and configure the settings for email notifications, remote syslog server, and proxy server. You can also view the release number of the CCKM running from this page.

To display the context of which Key Management service you are currently logged into within CCKM, the icon associated with the Key Management service displays at the top of the left-hand navigation bar.

The arrow button at the bottom of the navigation bar allows you to expand the bar to view the names of the menu options and collapse it to view only the icons associated with the menu options. Click the arrow button to either expand or collapse the navigation bar.

On the top-right side of the CCKM portal for Azure, the following options are available:

- **Azure Cloud Service Context Switcher:** This context switcher allows you to login into another Azure cloud service different from the current Azure cloud service into which you are currently logged. If you select the Azure cloud in which you are currently logged, the Multi-account Login/Logout window for the Azure account(s) displays. For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **AWS Login:** If you are not already logged into AWS, clicking on the AWS Login icon brings you to the AWS Password Login page where you can enter your AWS credentials to access the CCKM AWS cloud service (from the current cloud service in which you are currently logged). If you are already logged into AWS, clicking on the AWS Login icon brings you to the Multi-account Login/Logout window for the AWS account(s). For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).

- **Google Cloud Service Context Switcher:** This context switcher allows you to login into another Google Cloud organization different from the current Google Cloud organization into which you are currently logged. If you select the Google Cloud in which you are currently logged, the **Multi-account Login/Logout** window for the Google account(s) displays. For more information about the **Multi-account Login/Logout** window, see ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **Salesforce Cloud Service Context Switcher:** This context switcher allows you to login into another Salesforce cloud service different from the current Salesforce cloud service into which you are currently logged. This is Salesforce, Salesforce Government, or Salesforce Sandbox. If you select the Salesforce cloud in which you are currently logged, the Multi-account Login/Logout window for the Salesforce account(s) displays. For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **Logout:** Logout from CCKM.

Home

The **Home** page provides a dashboard to display key operation and count metrics.

Azure Directory Context Switcher (Support for Guest User for AAD B2B Collaboration)

CCKM supports the ability to allow Azure guest users to take part in B2B collaboration for Azure tenants to share user authentication and applications with partners. Prior to using this feature in CCKM, the guest user account must already be set up in the Azure Active Directory as a guest user with the appropriate access policies applied and the account activated in Azure. Once you are logged into CCKM Azure, from the **CCKM Directory Context Switcher** window, you have the ability to view all of the Azure directories to which you belong, including your default directory and your business partner's directory to which you are set up as a guest user. Using the **CCKM Directory Context Switcher** window, you can switch to any of the other directories to which you belong by logging into the directory from the same window. Once logged into a given directory, you can access and manage the resources and keys that reside in the given directory.

Note

The **Azure Directory Context Switcher** is not applicable to a CCKM that is used as a service principal.

The following **CCKM Directory Context Switcher** window displays the Azure directories in which a given user belongs:

You can perform the following actions using the CCKM Directory Context Switcher window:

- Logon to multiple directories for the Azure cloud
- Logout of a specific directory or all directories
- Perform key management for multiple directories from your current CCKM browser window

Accessing the CCKM Directory Context Switcher Window

To access the **CCKM Directory Context Switcher** window after you are logged into CCKM Azure, click on the **CCKM Directory Context Switcher** icon (🔑) at the top of right of the page. The CCKM Directory Context Switcher window displays. The following sections provide instructions on how to use this window.

Logging Out of User Directory

To logout of a specific directory, select the **Directory Logout** button next to the domain name associated with the directory for which to log out. The **Log out CipherTrust Cloud Key Manager** window displays. Click **Continue with Log Out** to log out. You are logged out of the directory and then the CCKM login page is displayed.

Switching to Another User Directory

To access another directory (you have not already logged into), select the **Switch to** button next to the domain name associated with the directory for which to log on. The Microsoft login page displays. Enter your user credentials for the given directory in the login dialog boxes. Once you successfully log into Microsoft, the Azure CCKM portal is displayed.

After you have logged into a directory, you are not prompted to log in again to switch to that directory.

Logging Out of All User Directories

To logout of all directories for Azure, click **Logout of All Directories**. The **Log out CipherTrust Cloud Key Manager** window displays. Click **Continue with Log Out** to log out. You are logged out of all the directories and then the CCKM login screen is displayed.

Keys

The **Keys** page allows Cloud administrators to view all the keys and manage them within the boundary of granted permissions. Those keys or key vaults that do not have List permission for the respective Cloud administrator will not be listed.

A **Search** box is available at the top left of the **Keys** page allowing for a search of a specific key by entering any one of the following parameters:

- Key ID
- Version Key ID
- Keyvault name
- Keyvault location
- Source key
- Subscription ID

The **Advanced** tab allows you to filter your search on any or a combination of these columns displayed on the **Keys** page with the exception of the **Count** and **Action** columns:

- Key Name
- Key Vault
- Version
- In Azure—Available options from the drop-down menu are In Azure, Soft Deleted, and Deleted.
- Backup—Available options from the drop-down menu are Backed Up and Not Backed Up.
- Enabled—Available options from the drop-down menu are Enabled and Disabled.
- Location
- Key Material Origin
- Auto Rotate—Available options from the drop-down menu are ON and OFF.

Each of these columns are described in more detail below in this section.

To select to filter based on a column or combination of these columns from the **Keys** page, click **Advanced**. The **Filters** section displays. From the column filter drop-down menu, select the name of the column on which to filter your search. For example, select **Key Name**. In the **Search** box, enter the value on which to search (for example, **MK-createkey** as the key name) and then click **Add**. For the **In Azure**, **Backup**, **Enabled** and **Auto Rotate** columns, a drop-down menu is available from which to select a value for the search. Click the down arrow, select a value from the available options, and then click **Add**. The specified search filter is then added to **Active Filters**. In the example, **Key Name: MK-createkey** is added to **Active Filters**. The results of the search displays in the **Keys** table. You can narrow your search by selecting more columns to add to the filter. To clear the filtered results, from **Active Filters**, click on the “X” (or the **Delete** button) for each of the named filters.

At the top right of the Keys page, the following buttons are available:

- **Export Keys:** Allows you to export the contents of the Keys list into a report in a CSV format.
- **New Key:** Allows you to upload an external BYOK key (CipherTrust Manager, DSM, nShield Connect, HSM .byok or PFX key) or create a native key. For information on how to upload an external BYOK key or create a native key, see ["Create a Key" on the next page](#).
- **Synchronize:** Allows you to download all the keys that were created in Azure (to which you have access) into CCKM. For information on how to synchronize your keys, see ["Synchronize Keys" on page 134](#).

The following columns display on the **Keys** page:

- **Key Name:** The name of the key.
- **Key Vault:** The name of the Azure Key Vault. If the key vault is a premium key vault, then (PREMIUM) will be appended to the key vault name.
- **Version:** The version number of the key.
- **Count:** The version count.
- **In Azure:** Indicates the status of the key in Azure, which can be one of the following:
 - A green check icon indicates the key exists in Azure.
 - An orange exclamation icon indicates the key vault or key was deleted from Azure with the Soft Delete feature enabled.
 - A red exclamation icon indicates the key vault or key was deleted from Azure without the Soft Delete feature enabled.
- **Backup:** Indicates whether a backup of the key exists in CCKM. The status can be one of the following:
 - A green check icon indicates the backup exists in CCKM.
 - A red exclamation icon indicates the backup key does not exist in CCKM.
- **Enabled:** Indicates whether the key is enabled for use.
- **Location:** Indicates the Azure region in which the key is stored. For example, West US or Central West US.

- **Key Material Origin:**
 - If the key was uploaded from CCKM, then the value is Internal(<source_key_name>).
 - If the key was not uploaded from CCKM as a BYOK key, then the value is EXTERNAL.
- **Auto-Rotate:** Indicates whether the key is set to be automatically rotated.
- **Actions:** Allows you to select any of the following actions on a given key:
 - Auto rotate
 - Delete
 - Add Version
 - Recover
 - Purge
 - Delete Backup
 - Restore

Create a Key

You have two options to create a new key:

- ["Upload your Own Key \(BYOK\)" below](#)
- ["Create a Native Key" on page 128](#)

Upload your Own Key (BYOK)

Upload the RSA keys created from the **Key Sources** page of CCKM to the Azure Key Vault. These are your "BYOK" keys.

As part of the upload process, Azure generates a corresponding backup key, which CCKM downloads and stores in the key source you are using (CipherTrust Manager or DSM) or in MongoDB (if you are using nShield Connect as your key source). For more information about the backup key, see ["Backup Key" on page 135](#).

Note

You must have the import permissions for the Azure Key Vault to which you wish to upload the key.

To upload your BYOK key to CCKM:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **All Keys** list page, select the **New Key** button and then **Upload**. The **Upload a Key** dialog box displays.

3. From **Source Key Tier**, ensure the key source you wish to use is selected. The key sources that display within **Source Key Tier** depends on the key source you are using. The following are the options:
 - **DSM**—Generated a key from the DSM and imported it into a Standard or Premium Azure Key Vault.
 - **CipherTrust Manager**—Generated a key from the CipherTrust Manager and imported it into a Standard or Premium Azure Key Vault.
 - **HSM.byok**—Generated a .byok key from an external Thales HSM and imported it into a Premium Azure Key Vault from CCKM. Once imported from CCKM, this key is stored in the DSM securely as a blob.
 - **PFX**—Imported an external password-protected PFX key into a Standard or Premium Azure Key Vault. Once imported from CCKM, this PFX key will be stored in the DSM securely as a blob.
 - **nShield**—Generated a key from the nShield Connect and imported it into a Standard or Premium Azure Key Vault.
4. From **Source Key** box, select the source key. Enter the first three characters of the name of the key to bring it up for selection.
5. From **Key Vault Tier** box, select the key vault tier of **Standard** or **Premium** depending on the subscription service type you have purchased.
6. From the **Key Vault Region** box, select the region where your key vault resides and whether you want to use the Azure Standard or Premium subscription service. Based on the Standard or Premium Key Vault Tier selection, the regions are filtered accordingly displaying only the regions, which are either Standard or Premium.
7. From the **Key Vault** box, select the name of the Azure Key Vault to where you intend to upload the key.
8. Add the name of the key in the **Key Name** box. If you wish to use the key name you entered when you generated this key from the **Key Sources** page, select the **Use source key name** check box. The name will display in the **Key Name** box.
9. From the **Key Destination** box, select either **Software** or **HSM** (Premium subscription only) depending on which destination you want to use.
10. Click **Enabled**, if the key is enabled. Note that if the key is disabled, the key cannot be used for cryptographic operations.
11. Enter the activation date of the key in the **Activation Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
12. Enter the expiration date of the key in the **Expiration Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
13. From **Key Operations**, select the cryptographic operations the key will perform. The options are:
 - Encrypt
 - Decrypt
 - Sign
 - Verify
 - Wrap Key
 - UnwrapKey
14. (Optional) From **Tags**, enter the tag name and value of the key.
15. Click **Upload to Azure**.
The uploaded key is displayed on the **All Keys** list page.

Create a Native Key

Create a native key in an Azure key vault and select the key types and sizes natively available in Azure. There is no source key tier as the Azure key vault will be the source of the key material. After CCKM creates a native key, it displays as **EXTERNAL** under the **Key Material Origin** column within the **All Keys** list page.

As part of creating a native key, Azure generates a corresponding backup key, which CCKM downloads and stores in the key source you are using (CipherTrust Manager or DSM), or in MongoDB (if you are using nShield Connect as your key source).

To create a native key:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **All Keys** list page, select the **New Key** button and then **Create**. The **Create Key** dialog box displays.
3. From the **Key Vault Tier** box, select the key vault tier of **Standard** or **Premium** depending on the subscription service type you have purchased.
4. From the **Key Vault Region** box, select the region where your key vault resides. Based on the Standard or Premium Key Vault Tier selection, the regions are filtered accordingly displaying only the regions, which are either Standard or Premium.
5. From the **Key Vault** box, select the name of the Azure key vault to where you intend to create the key.
6. Add the name of the key in the **Key Name** box.
7. From the **Key Destination** box, select either **Software** or **HSM** (Premium subscription only) depending on which destination you want to use.
8. From **Key Type**, select **RSA** or **EC** for your key type.
9. If you selected **RSA** for key type, then select **2048**, **3072**, or **4096** from **Key Size** for the key size to apply to the new key. If you selected **EC** for key type, then select **P-256**, **P-384**, **P-521**, or **SECP256K1** from **Elliptical Curve Name** for the name of the elliptical curve to apply to the new version of the key.
10. Click **Enabled**, if the key will be enabled. Note that if the key is disabled, the key cannot be used for cryptographic operations.
11. Enter the activation date of the key in the **Activation Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
12. Enter the expiration date of the key in the **Expiration Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
13. From **Key Operations**, select the cryptographic operations the key will perform. The options are:
 - Encrypt
 - Decrypt
 - Sign
 - Verify
 - Wrap Key
 - UnwrapKey
14. (Optional) From **Tags**, enter the tag name and value of the key. Up to 15 tags are supported.
15. Click **Create**.

The new key is displayed on the **All Keys** list page.

Delete a Key

From the **Keys** page, deleting a key deletes it from Azure Key Vault (but a backup key remains in the CCKM). After deletion, two new actions are displayed within the **Action** column: *Restore* and *Delete Backup*.

Note

This Delete action deletes ALL versions of the Azure key.

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. In the resulting **All Keys** list, find the name of the key and click **Delete** from the **Action** column. A warning message is displayed.
3. Enter or copy/paste the confirmation phrase.
4. Click **Delete**.

Restore a Key

In the event that someone deletes an IBM key directly in the Azure portal, it is possible to restore it from the CCKM as follows:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. From the **All Keys** list page, select **Restore** from the **Action** column of a deleted key.
The key and all its versions and metadata are restored to Azure Key Vault. The Success message is displayed, and the key is listed at the top of the **All Keys** page.

Note

If anyone deletes the backup key from CCKM, it will **not** be possible to restore the key to IBM.

Delete a “Soft-deleted” Key

From the **Keys** page, soft deleting a key deletes it from Azure Key Vault removing it from displaying in the CCKM UI. However, the key still exists in the Azure Key Vault and CCKM. After a soft delete, two new actions are displayed within the Action column: *Recover* and *Purge*.

To delete a key in a soft-delete state:

1. In the left navigation pane of the CCKM portal, select **Keys**.
2. From the **All Keys** list page, find the name of the key and click **Soft Delete** from the **Action** column.
A warning displays indicating that this action will delete the key from your Azure key vault and that the operation may take some time to complete. The message also indicates to type the confirmation phrase (I wish to delete the key) in the text box if you wish to delete the key.
3. Enter or copy/paste the confirmation phrase in the text box.
4. Click **Delete**.
The key and all its versions and metadata are deleted from the Azure Key Vault. The Success message is displayed, and the key is no longer listed on the **All Keys** page.

Recover a “Soft-delete” Key (to Azure)

From the **Keys** page, recovering a key that is in a “soft-delete” state allows you to restore the key to the Azure Key Vault. After the key is recovered, the key displays in the Azure Key Vault and is listed within the **All Keys** page.

To recover a key in a soft-delete state:

1. In the left navigation pane of the CCKM portal, select **Keys**.
2. From the **All Keys** list page, find the name of the key and select **Recover** from the **Action** column.
A warning displays indicating that this action will recover your key from your Azure key vault and that the operation may take some time to complete.
3. Click **Recover**.
The key and all its versions and metadata are restored to Azure Key Vault. The Success message is displayed, and the key is listed at the top of the **All Keys** page.

Purge a “Soft-delete” Key

From the **Keys** page, purging a key that is in a “soft-delete” state allows you to delete it permanently from the Azure Key Vault. However, you still can restore this same key to the Azure Key Vault using the **Restore** action. For more information, see ["Restore a “Soft-delete” Key \(to Azure\)" on the facing page](#).

Note

Prior to purging a key that is in a “soft-delete” state, you must first grant the Purge access policy permission within the given key vault in the Azure portal to the CCKM user or application using CCKM (as a service principal) to perform the purge. To grant the Purge access policy permission within the Azure portal, go to key vault **Settings > Access Policies**. For **Permission model**, select **vault access policy**. Under **Current Access Policies**, select **Key Permissions**. Then for the user (under **User**) or the application (under **Application**) (or both) you wish to grant this permission, select **Purge** under **Privileged Key Operations**.

To purge a key in a soft-delete state:

1. In the left navigation pane of the CCKM portal, select **Keys**.
2. From the **All Keys** list page, find the name of the key and click **Purge** from the **Action** column.
A warning displays indicating that this action will purge the key from the Azure key vault. The message also indicates to type the confirmation phrase (I wish to purge the Azure key) in the text box if you wish to purge the key.
3. Enter or copy/paste the confirmation phrase in the text box.
4. Click **Purge**.
The key and all its versions and metadata are deleted from the Azure Key Vault. The Success message is displayed, and the key is no longer listed on the **All Keys** page.

Restore a “Soft-delete” Key (to Azure)

From the **Keys** page, restoring a key that was previously set to a “soft-delete” state and then purged allows you to restore the key from the key source you are using (CipherTrust Manager or DSM) or from MongoDB (if you are using nShield Connect as your key source) and upload it to the Azure Key Vault. With a successful restore of a “soft-delete” key, the key and all its versions and metadata are restored to Azure Key Vault.

To restore a key that was previously set to a “soft-delete” state and then purged:

1. In the left navigation pane of the CCKM portal, select **Keys**.
2. From the **All Keys** list page, find the name of the key and select **Restore Key** from the **Action** column.
A warning displays indicating that this action will restore your key to your Azure key vault and that the operation may take some time to complete.
3. Click **Restore**.
If successful, the Success message is displayed, and the key is listed at the top of the **All Keys** page.

Rotate a Key

CCKM allows for a manual or autorotation of a key. You manually rotate a key by adding a new version from the **Add a version** dialog box. Auto rotating a key is adding a new version of the key at a scheduled time. Key autorotation requires that you first schedule the autorotation in the **Schedules** page prior to enabling this feature in the **Auto-rotate Key** dialog box. Note that the key you select to autorotate must be enabled for it to be used for cryptographic operations after the rotation.

Note

Any key that is shared among different users within the same Azure cloud and is scheduled for a key rotation by one user cannot be scheduled for autorotation again by another user. Any key that is scheduled for autorotation displays the status of “AUTO” with an orange check icon next to it within the **Auto Rotate** column of the **Keys** page. If you attempt to schedule autorotation using **Rotate Key** within the **Keys** page with a key already scheduled, a message displays indicating that the key is already scheduled for rotation with the scheduled interval, date, and time at which the rotation is to take place. In addition, the name of the user responsible for scheduling the rotation displays.

Manually Rotate a Key (Add a New Version of a Key)

To rotate a key manually (add a new version of a key):

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. In the **All Keys** list, find the name of the key to which to add a new version.
3. Select **Add Version** from the **Actions** drop-down menu. The **Add a Version** dialog box is displayed.
4. From the **Key Provider** box, select one of the following as the key source to which to add a new version:
 - **DSM**—Key was generated from DSM and imported into a Standard or Premium Azure Key Vault.
 - **CipherTrust Manager**—Key was generated from CipherTrust Manager and imported into a Standard or Premium Azure Key Vault.
 - **HSM.byok**—Your byok key was generated from an external Thales HSM and imported into a Premium Azure Key Vault from CCKM.
 - **PFX**—Key was imported as an external password-protected PFX key into a Standard or Premium Azure Key Vault.
 - **nShield**—Key was generated from nShield Connect and imported into a Standard or Premium Azure Key Vault.
 - **Native**—Key is generated natively in the designated Azure Key Vault using the CCKM UI. Note that this option is equivalent to generating a key in the Azure portal.
5. From the **PFX-File Password** box, enter your password for your PFX file. This box only displays, if you selected PFX as your source key tier.
6. From the **Source Key** box, select the source key to which to add a new version. Based on the selected source key tier and source key, the **Key Vault Tier**, **Key Vault Region**, and **Key Name** boxes are prepopulated with the values associated with your selections.
7. From the **Key Destination** box, select either **Software** or **HSM** (Premium subscription only) depending on which destination you want to use.
8. Click **Enabled**, if the key is enabled. Note that if the key is disabled, the key cannot be used for cryptographic operations. This option may already be selected depending on the selected source key.
9. From **Key Type**, select **RSA** or **EC** for your key type. **Key Type** only displays, if you selected **Native** as your source key tier. If you select **RSA**, then select **2048**, **3072**, or **4096** from **Key Size** for the key size to apply to the new version of the key. If you select **EC**, then select **P-256**, **P-384**, **P-521**, or **SECP256K1** from **Elliptical Curve Name** for the name of the elliptical curve to apply to the new version of the key.
10. Enter the activation date of the new version of the key in the **Activation Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
11. Enter the expiration date of the new version of the key in the **Expiration Date** box in the format MM/DD/YY or select a day from the calendar button at the right of the box.
12. From **Key Operations**, click the cryptographic operations the new version of the key will perform. The options are:
 - Encrypt
 - Decrypt
 - Sign
 - Verify
 - Wrap Key
 - UnwrapKey

13. (Optional) From **Tags**, enter the tag name and value of the new version of the key.
14. Click **Upload to Azure**.
The new version of the key is displayed in the list. As part of the process of adding a new key version of a key, Azure generates a corresponding backup key blob, which CCKM downloads and stores in DSM.

Enable Autorotation of Key

To enable autorotation of a key (add a new version of the key at a scheduled time):

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. In the **All Keys** list, find the name of the key for which to enable autorotation.
3. Select **Auto Rotate** from the **Actions** drop-down menu. The **Auto-rotate Key** dialog box is displayed. The **Key Algorithm** box is populated with the algorithm used in the selected key to autorotate.
4. From **Enable autorotation on this key?**, select **On** to enable the autorotation of this key. By default, this toggle is initially set to **Off**.

Note: If the toggle for **Enable autorotation on key expiration?** is displayed, skip it. This option displays only if the key has an expiration date associated with it. This option is not applicable to enabling autorotation of the key.

5. From the **Schedule** drop-down menu, select a rotation schedule to which to apply to this key. Any key-rotation schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.
6. Select **Change key algorithm**, if you choose to use a different key algorithm than the one displayed in **Key Algorithm** for the new version of the key. If you choose to use a different key algorithm, **Key Provider**, **Key Destination**, and **Key Type** display for configuration.
7. From the **Key Provider** box, select one of the following as the key source to which to add a new version:
 - **DSM**—Key is to be generated from DSM and imported into a Standard or Premium Azure Key Vault.
 - **CipherTrust Manager**—Key is to be generated from CipherTrust Manager and imported into a Standard or Premium Azure Key Vault.
 - **nShield**—Key is to be generated from nShield Connect and imported into a Standard or Premium Azure Key Vault.
 - **Native**—Key is to be generated natively in the designated Azure Key Vault using the CCKM UI. Note that this option is equivalent to generating a new key in the Azure portal.
8. From the **Key Destination** box, select either **Software** or **HSM** depending on whether you want to use the Azure Standard or Premium subscription service. If you are using the Standard subscription service for the selected key to be autorotated, then Software is selected. If you are using the Premium subscription service for the selected key to be autorotated, then HSM is selected. However, you have the option to select Software to use the Standard subscription service for the new version of the key.

9. From **Key Type**, select **RSA** or **EC** for the key type of the new version of the key.
 - If your source key tier is set to **DSM**, then the key type of **RSA** along with the key sizes of **2048**, **3072**, and **4096** for **Key Size** are your options.
 - If your source key tier is set to **CipherTrust Manager**, then the key type of **RSA** along with the key sizes of **2048**, **3072**, and **4096** for **Key Size** are your options.
 - If your source key tier is set to **nShield**, then the key type of **RSA** along with the key sizes of **2048**, **3072**, and **4096** for **Key Size** are your options.
 - If your source key tier is set to **Native**, then the key types of **RSA** and **EC** are your options. For **RSA**, the key sizes **2048**, **3072**, and **4096** for **Key Size** are your options. For **EC**, the name of the elliptical curves **P-256**, **P-384**, **P-521**, and **SECP256K1** for **Elliptical Curve Name** are your options.
10. Click **Submit**.

Synchronize Keys

Synchronizing allows you to download all the keys that were created in Azure (to which you have access) into CCKM. You have the option to schedule key synchronization. Perform this scheduling in the **Schedules** page.

The story below illustrates a use of synchronization and restoration:

Sally is the Azure Cloud administrator with access to many vaults. She has synchronized keys in CCKM. Now, innocent, ignorant rogue Charlie logs into Azure portal and deletes all the keys in his vault, which also belonged to Sally. Now, if Sally synchronizes keys again from CCKM portal, she will see those keys as deleted in CCKM portal. However, she will also see options to restore the deleted keys back into the relevant Azure Key Vault. This is because CCKM also maintains Azure backup keys as part of basic key management.

To synchronize your keys:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. Click **Synchronize**. A warning box is displayed; click **Synchronize** again to proceed with the synchronization. New keys that are created in Azure are retrieved and displayed in the CCKM UI.

Enable Autorotation before Key Expiration

To enable autorotation of a key before it expires, you must first set up a key expiration schedule in the **Schedules** page. Once the key is enabled for autorotation, the key will be rotated before it expires. After the key is autorotated, the key will have a new expiration date based on the key-expiration schedule.

To enable autorotation of a key before it expires:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. In the **All Keys** list, find the name of the key for which schedule a key rotation.
3. Select **Auto Rotate** from the **Actions** drop-down menu. The **Auto-rotate Key** dialog box is displayed. The **Key Algorithm** box is populated with the algorithm used in the selected key to autorotate.
4. From **Enable autorotation on key expiration?**, select **On** to enable the autorotation of this key before it expires. By default, this toggle is initially set to **Off**.

Note: Skip the **Enable autorotation on this key?** as it is not applicable to enabling autorotation of this key before it expires.

5. From the **Schedule** drop-down menu, select a key-expiration schedule to which to apply to this key. Any key-expiration schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.

6. Select **Change key algorithm**, if you choose to use a different key algorithm than the one displayed in **Key Algorithm** for the new version of the key. If you choose to use a different key algorithm, **Source Key Tier**, **Key Destination**, and **Key Type** display for configuration.
7. From **Source Key Tier**, select one of the following as the key source of the new version of the key:
 - **DSM**—Key is to be generated from DSM and imported into a Standard or Premium Azure Key Vault.
 - **CipherTrust Manager**—Key is to be generated from CipherTrust Manager and imported into a Standard or Premium Azure Key Vault.
 - **nShield**—Key is to be generated from nShield Connect and imported into a Standard or Premium Azure Key Vault.
 - **Native**—Key is to be generated natively in the designated Azure Key Vault using the CCKM UI. Note that this option is equivalent to generating a new key in the Azure portal.
8. From the **Key Destination** box, select either **Software** or **HSM** depending on whether you want to use the Azure Standard or Premium subscription service. If you are using the Standard subscription service for the selected key to be autorotated, then Software is selected. If you are using the Premium subscription service for the selected key to be autorotated, then HSM is selected. However, you have the option to select Software to use the Standard subscription service for the new version of the key.
9. From **Key Type**, select **RSA** or **EC** for the key type of the new version of the key.
 - If your source key tier is set to **DSM**, then the key type of **RSA** along with the key sizes of **2048** and **4096** for **Key Size** are your options.
 - If your source key tier is set to **CipherTrust Manager**, then the key type of **RSA** along with the key sizes of **2048**, **3072**, and **4096** for **Key Size** are your options.
 - If your source key tier is set to **nShield**, then the key type of **RSA** along with the key sizes of **2048**, **3072**, and **4096** for **Key Size** are your options.
 - If your source key tier is set to **Native**, then the key types of **RSA** and **EC** are your options. For **RSA**, the key sizes **2048**, **3072**, and **4096** for **Key Size** are your options. For **EC**, the name of the elliptical curves **P-256**, **P-384**, **P-521**, and **SECP256K1** for **Elliptical Curve Name** are your options.
10. Click **Submit**.

Export Keys

Export Keys allows you to export the contents of the Keys list into a report in a CSV format.

1. In the left navigation bar, click **Keys**.
2. Click **Export Keys**.

This will download all of the keys' versions in a report in a CSV format.

Backup Key

When a key is uploaded to Azure from CCKM, Azure creates a backup key (as an encrypted blob), which contains information about the Azure key and all its versions. The backup key can be used to restore a key that has been deleted. After Azure creates a backup key, CCKM automatically downloads and stores the key in the key source you are using (CipherTrust Manager or DSM), or in MongoDB (if you are using nShield Connect as your key source). In addition, when Azure keys are synchronized, the backup key of any key that was created directly in the Azure portal is also downloaded and stored in the key source you are using (CipherTrust Manager or DSM), or in MongoDB (if you are using nShield Connect as your key source).

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Delete a Backup Key

Delete a backup key when you definitely do not want the key and have no corresponding data that will ever need decryption.

For a key that has been deleted:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. From the **All Keys** list page, select **Delete Backup** from the action column of a deleted key.
3. The **Delete Key** warning page is displayed. Type or Copy/paste the confirmation phrase (I wish to delete the Azure backup key).
4. Click **Delete**.

The key is removed from the list.

Reports

CCKM includes the following reports:

- **Combined Key Activity Reconciliation Report**

Provides the history of the key in a selected period. Click Run Report to generate a new list of events connected to a key.

- **Azure Key Activity Report**

Illustrates the activity type performed by a specific user and at the stated time.

- **Azure Key Service Usage Report**

Indicates the relationship between the application and the key, including:

- Key name
- Key Description
- Requesting Service: Name or ID of the service using a key
- Service Platform
- Request Timestamp: Time when the application used the key.

- **Azure Key Aging Report**

Provides information about key expiration using the following columns:

- Key Name
- Key description
- Key destination: Indicates services, such as Azure
- Key owner: Person who created the key. In Azure, there is no owner associated with the key.
- Key expiration: Date and time at which this key expires.

- **Cloud Key Manager User Action Report**

Lists the users and their actions in creating and deleting keys in the CCKM portal.

Schedules

The **Schedules** page allows Cloud administrators to view and schedule the following job types:

- Key Rotation
- Key Synchronization
- Key Expiration

CCKM provides support for multiple schedules for each of the job types.

At the top right of the **Schedules** page, the **Add Schedule** button is available from which to add a scheduled job type.

Note

If you are using CCKM as a service principal, you are not required to enter a username and password to schedule key rotation, key synchronization, or key expiration for Azure Key Management. The username and password boxes do not display in the dialog box for each of these job types.

Schedule Key Rotation

CCKM provides support for multiple schedules of the rotation of an Azure key. CCKM allows for a scheduled rotation (autorotation) of an Azure key. A new version of the key is added to the Azure key during a scheduled rotation. Scheduled rotation requires that this feature be configured in the **Schedules** page prior to enabling the feature in the **Auto Rotate Key** dialog box (from the **Actions** column of the **All Keys** list). Your Azure login password is required as part of the configuration and is saved in the key source you are using (CipherTrust Manager or DSM), or in MongoDB (if you are using nShield Connect as your key source). If you have both DSM and nShield Connect configured as your key sources, then the Azure login password is saved only to DSM where it is stored.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

During a scheduled rotation of a key, CCKM uses the associated username and password to rotate the key. If the password expired or changed, then the new password must be reentered. Otherwise, the scheduled rotation will fail.

You can pause or delete a scheduled key rotation in the **Schedules** page. Note that when a key rotation schedule is deleted from CCKM, then the Azure user password is also deleted from the key source you are using (CipherTrust Manager or DSM) or from MongoDB (if you are using nShield Connect as your key source).

Set up a Key Rotation Schedule

To set up a key rotation schedule:

1. In the CCKM portal, in the left navigation bar, select **Schedules**. The **Schedules** page displays.
2. On the **Schedules** page, select the **Add Schedule** button. The **Add Schedule** dialog box displays including your username in the **Username** box.

Note: If you are using CCKM as a service principal, the **Username** box does not display as you are not required to enter a username when using CCKM as a service principal

3. From the **Job Type** drop-down menu, select **KEY_ROTATION**.
4. In the **Name** box, enter the name of the schedule. Ensure this name is unique for this job type.
5. (Optional) Enter a description of the schedule in the **Description** box.

6. For **Pause**, select **No**.
7. For **Schedule**, set a schedule for the rotation by selecting **Basic** (to enter a date and interval for the schedule) or **Advanced** (to enter a Cron Expression for the schedule).

If you selected **Basic**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. Set the repeat interval of the key rotation by entering a number in **Repeat Interval** and then selecting Day, Week, or Month from the drop-down menu. The supported ranges are 1 through 30 days, 1 through 4 weeks, and 1 through 12 months. You can increase or decrease the number you enter.

If you selected **Advanced**, enter the cron expression in the **Cron Expression** box.
8. Enter your Azure user password in the **User Password** box.

Note: If you are using CCKM as a service principal, the **User Password** box does not display as you are not required to enter a password when using CCKM as a service principal.

9. Click **Save**.

Pause a Key Rotation Schedule

To pause a key rotation schedule, select **Yes** for **Pause** within the **Add Schedule** dialog box and then click **Save**. The setting is saved. To resume the rotation schedule after pausing it, select **No** for **Pause** and then click **Save**. The setting is saved.

Delete a Key Rotation Schedule

To delete a key rotation schedule, select **Delete** from the **Actions** drop-down menu from the **Schedules** page. Note that the Azure user password associated with the given key rotation schedule is also deleted from the key source you are using (CipherTrust Manager or DSM) or from MongoDB (if you are using nShield Connect as your key source).

Schedule Key Synchronization

CCKM allows for multiple schedules of the synchronization of Azure keys. Synchronizing downloads any keys that were created in Azure, outside of the CCKM portal, into your CCKM. Scheduled key synchronization requires that this feature be configured in the **Schedules** page. You can also pause or delete a scheduled key synchronization in the **Schedules** page. Note that when a key synchronization schedule is deleted from CCKM, then the Azure user password is also deleted from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as the key source). If you have both DSM and nShield Connect configured as your key sources, then the Azure user password is deleted from DSM where it is stored.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Set up a Key Synchronization Schedule

1. In the CCKM portal, in the left navigation bar, select **Schedules**. The **Schedules** page displays.
2. On the **Schedules** page, select the **Add Schedule** button. The **Add Schedule** dialog box displays including your username in the **Username** box.

Note: If you are using CCKM as a service principal, the **Username** box does not display as you are not required to enter a username when using CCKM as a service principal.

3. From the **Job Type** drop-down menu, select **KEY_SYNCHRONIZATION**.
4. In the **Name** box, enter the name of the schedule. Ensure this name is unique for this job type.
5. (Optional) Enter a description of the schedule in the **Description** box.
6. For **Pause**, select **No**.
7. For **Schedule**, set a schedule for the key synchronization by selecting **Basic** (to enter a date and interval for the schedule) or **Advanced** (to enter a Cron Expression for the schedule).

If you selected **Basic**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. Set the repeat interval of the key synchronization by entering a number in **Repeat Interval** and then selecting Day, Week, or Month from the drop-down menu. The supported ranges are 1 through 30 days, 1 through 4 weeks, and 1 through 12 months. You can increase or decrease the number you enter.

If you selected **Advanced**, enter the cron expression in the **Cron Expression** box.
8. Enter your Azure user password in the **User Password** box.

If you are using CCKM as a service principal, the **User Password** box does not display as you are not required to enter a password when using CCKM as a service principal.
9. Click **Save**.

Schedule Key Expiration

CCKM provides support for multiple schedules of the expiration of Azure keys in the **Schedules** page. You can also pause or delete a scheduled key expiration in the **Schedules** page. Note that when a key expiration schedule is deleted from CCKM, then the Azure user password is also deleted from the key source you are using (CipherTrust Manager or DSM), or from MongoDB (if you are using nShield Connect as your key source). If you have both DSM and nShield Connect configured as your key sources, then the Azure user password is deleted from DSM where it is stored.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Set up a Key Expiration Schedule

To set up a key expiration schedule:

1. In the CCKM portal, in the left navigation bar, select **Schedules**. The **Schedules** page displays.
2. On the **Schedules** page, select the **Add Schedule** button. The **Add Schedule** dialog box displays including your username in the **Username** box.

Note: If you are using CCKM as a service principal, the **Username** box does not display as you are not required to enter a username when using CCKM as a service principal.

3. From the **Job Type** drop-down menu, select **KEY_EXPIRATION**.
4. In the **Name** box, enter the name of the schedule. Ensure this name is unique for this job type.
5. (Optional) Enter a description of the schedule in the **Description** box.
6. For **Pause**, select **No**.
7. From **Start Date**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers.
8. From **Expire a new key after**, enter a number and select the interval unit of Hour, Day, Week, Month, or Year from the drop-down menu after which the new key expires. The supported ranges are 6 through 24 hours, 1 through 30 days, 1 through 4 weeks, and 1 through 12 months. You can increase or decrease the number you enter.
9. Enter your Azure user password in the **User Password** box.
If you are using CCKM as a service principal, the **User Password** box does not display as you are not required to enter a password when using CCKM as a service principal.
10. Click **Save**.

Logs

CCKM maintains logs for events, such as login, key generation, synchronizing of keys, and deletion of keys, and displays these logs in the **All Logs** list of the **Logs** page. For each logged event listed on the **Logs** page, the following information is displayed:

- Event name
- Severity level
- Date and time of the event
- Event message
- User (name) associated with the event

You can search for a specific logged event from the **Logs** page using the **Search** box. Allowable filters on the search are event name, severity level, event message, and user (name).

Key Sources

The **Key Sources** page displays **all** of the keys that were generated from the key source you are using. If you are logged into multiple clouds within CCKM, this page displays all of the keys from these clouds.

Three tabs are available at the top of the **Key Sources** page:

- **CipherTrust Manager Key:** Use this tab to use CipherTrust Manager as your key source. The keys are generated and stored within CipherTrust Manager.
- **DSM Key:** Use this tab to use DSM as your key source. The keys are generated and stored within DSM.
- **nShield Key:** Use this tab to use nShield Connect HSM as your key source. The keys are generated within nShield Connect and then stored as blobs within MongoDB.

Note

CCKM does not support the concurrent use of CipherTrust Manager, DSM, and nShield Connect as key sources.

Keys listed on the **Key Sources** page are listed by name, cloud ID, key type (the cloud in which this key is used), the algorithm of the key, the creation date of the key, key description and actions you can take regarding that key.

A **Search** box is available at the top left of the **Keys Sources** page allowing for a search of a specific key by entering any one of the following parameters:

- Name (key name)
- Cloud ID
- Key Type
- Algorithm
- Description
- Created By (a key created by a specific user)

Add (Generate) a Key

From the **Key Sources** page, you can add (or generate) keys in CCKM using CipherTrust Manager, DSM, or nShield Connect as a key source for *all* of the clouds into which you are currently logged.

Note

The key algorithm currently supported for an Azure key in CCKM is RSA.

Add (Generate) a CipherTrust Manager Key

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **CipherTrust Manager Key** tab.
3. Select **Add Key > Azure Key**.
4. In the **Add CipherTrust Manager Key** dialog box, select the name of the user of the key from the **User** drop-down menu. Service is fixed to **Azure**.
5. From the **Source Key Tier** box, select **CipherTrust Manager** from the drop-down menu.
6. In the **Name** box, enter the name of the new key.
7. Enter a description of the key in the **Description** box.

8. From the **Algorithm** box, select the algorithm (**RSA2048**, **RSA3072**, or **RSA4096**) to apply to the key.
9. Click **Save** to save the new key to CCKM. The new key is added to the keys list. (Reset clears the screen before it has been saved.)

Add (Generate) a DSM Key

From the **Key Sources** page, the **DSM Key** tab allows you to generate a .byok key from an external HSM (such as nShield Connect HSM) and import it into a Premium Azure Key Vault from CCKM. From the **DSM Key** tab, you can also import an external password-protected PFX key into a Standard or Premium Azure Key Vault. Once imported from CCKM, the .byok and PFX key is stored in DSM securely as blobs.

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **DSM Key** tab.
3. Select **Add Key > Azure Key**.
4. In the **Add DSM Key** dialog box, select the name of the user of the key from the **User** drop-down menu. **Service** is fixed to Azure.
5. In the **Source Key Tier**, select one of the following as a key source of the key:
 - **DSM**—Generate a key from DSM and import it into a Standard or Premium Azure Key Vault.
 - **HSM.byok**—Generate a .byok key from an external Thales HSM and import it into a Premium Azure Key Vault from CCKM. Once imported from CCKM, this .byok key is stored in the DSM securely as a blob. The .byok key is user and region specific. Be sure to select the correct username and region when creating the .byok key.
 - **PFX**—Import an external password-protected PFX key into a Standard or Premium Azure Key Vault. Once imported from CCKM, this PFX key is stored in the DSM securely as a blob.
6. In the **Name** box, enter the name of the new key.
7. Enter a description of the key in the **Description** box.
8. From the **Algorithm** box, select the algorithm (**RSA2048**, **RSA3072**, or **RSA4096**) to apply to the key.
9. Click **Save** to save the new key to CCKM. The new key is added to the keys list. (Reset clears the screen before it has been saved.)

Add (Generate) an nShield Key

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **nShield Key** tab.
3. Select **Add Key > Azure Key**.
4. In the **Add nShield Key** dialog box, select the name of the user of the key from the **User** drop-down menu. **Service** is fixed to Azure.
5. In the **Name** box, enter the name of the new key.
6. Enter a description of the key in the **Description** box.
7. From the **Algorithm** box, select the algorithm (**RSA 2048**, **RSA 3072**, or **RSA 4096**) to apply to the key.
8. Click **Save** to save the new key to CCKM. The new key is added to the keys list. (Reset clears the screen before it has been saved.)

Delete a Key

Deleting a key from the **Key Sources** page deletes the key from CCKM. When deleting a key from CCKM, the key is deleted from the key source you used to generate the key. However, if you generated the key from nShield Connect, the key is deleted from MongoDB where the key is stored.

1. In the CCKM portal, in the left navigation bar, select **Key Sources**.
2. Select the **DSM Key**, **CipherTrust Manager**, or **nShield Key** tab depending on the key source you used to generate this key initially.
3. Click **Delete** next to the target key.
4. The **Delete Key** dialog box with a Warning display asking you to confirm the key deletion by entering the supplied phrase.
5. Enter or copy/paste the confirmation phrase.
6. Click **Delete**.

Manage Keys in Key Sources List Page

In addition to adding and deleting keys, the **Key Sources** page allows you to sort the existing keys by Name, Key Type, Algorithm and Created Date.

Settings

To access the **Settings** page in CCKM, select **Settings** from the left-hand navigation bar. From the **Settings** page, you can:

- Enter the email addresses of the recipients who are to receive the email notifications.
- Enable email notifications to be sent out from CCKM when specific types of key actions are performed. For example, when a key is uploaded to the cloud service. You can also enable CCKM to send reminder notifications for when to rotate a key.
- Configure remote syslog servers to which to send syslog messages.
- (Applicable to CCKM when used as a service principal) Change your tenant password or revoke your administrator consent.
- View information about the software release number of the CCKM you are running including the build and version number.

Note that for Azure, each of the supported clouds (Azure and Azure China) must be set up independently of each other, as these are separate and distinct key management services within Azure.

Adding Recipients' Email Addresses (for Notifications)

Use the **General** tab from the **Settings** page to enter the email addresses of the recipients who are to receive email notifications from CCKM. Enter the recipients' email addresses separated by a comma in the **Notification Recipient** box and then click **Save** to save setting.

Enabling Notifications

Using the **Keys Notification** tab from the **Settings** page, you can configure CCKM to send an email notification when a key is deleted from Azure or restored or uploaded to Azure. You can also use this tab to configure CCKM to send a reminder notification for when to manually rotate a key along with the frequency (in days) at which a

notification is sent. Add the email address(es) of the recipients in the **General** tab from the **Settings** page. By default, no notifications are sent

To enable email notifications:

1. In the **Settings** page, select the **Keys Notification** tab.
2. Under **Notifications**, select **On** for each of the notifications you wish to enable:
 - Rotate Azure Key (reminder notification)
 - Delete Azure Key
 - Restore Azure Key
 - Upload Azure Key
3. If you selected to enable **Rotate Azure Key**, in the **Days** box, enter the number of days for the frequency a reminder notification is sent.
4. Click **Save**.

Configuring Syslog Server

Note

In this document, the terms "syslog server" and "log server" are synonymous.

The **Syslog** tab from the **Settings** page allows you to configure the remote syslog or log server to which to send CCKM log data using TCP, TLS, or UDP protocol as the transport protocol. If you use the TLS protocol, then you are required to upload the syslog server certificate to CCKM for the TLS connection.

The **Syslog** tab also allows you to delete your syslog server configuration so that log data are no longer sent to the server.

Prior to configuring the setting for a remote syslog server, ensure that you have installed and configured the syslog server including configuring the setting for the port number the transport protocol will use to connect to CCKM. This port number configuration must match the port configuration you set in the **Syslog** tab of the **Settings** page.

Note

Support for both Syslog and Splunk as a remote syslog server is provided in CCKM. However, the use of a Splunk cloud server as a remote syslog server is currently not supported in CCKM.

Configure Remote Syslog Server

To configure a remote syslog server to which to send CCKM log data:

Note

The facility name of "LOCAL1" for the syslog server displays in the **Facility** box. This default value is not available for modification.

1. In the **Settings** page, select the **Syslog** tab. The **Syslog** dialog box displays.
2. In the **Hostname** box, enter the hostname or IP address of the syslog server.
3. In the **Port** box, enter the port number the transport protocol uses to connect to the syslog server. Enter a value between 1 and 65535. The default value is 514.
4. In the **Protocol** drop-down menu, select **TCP**, **TLS**, or **UDP** for the transport protocol to use when sending the log data to the syslog server. The default value is **UDP**. If you select **TCP**, proceed to Step 6. If you select **TLS**, proceed to the next step. Otherwise, proceed to Step 7.

5. In the **Certificate** box, select **Choose File** and then select the syslog server certificate to upload to CCKM.
6. Click **Test Connection** to test the connection between CCKM and the remote syslog server. This button is only available for use when either **TCP** or **TLS** is the selected transport protocol.
7. In the **Log Format** drop-down menu, select **CEF** (Common Event Format), **Plain Text**, or **RFC5424** for the format of the log message to use when sending the log data. The default value is **RFC5424**.
8. (Optional) In the **Description** box, enter a description of the remote syslog server.
9. Click **Save**.

Delete Remote Syslog Server Configuration

To delete the configuration of a remote syslog server:

1. In the **Settings** page, select the **Syslog** tab. The **Syslog** dialog box displays.
2. Click **Delete**. The **Delete Syslog** dialog box displays.
A warning message displays indicating that this action will delete the syslog settings from CCKM. The message also indicates to type the confirmation phrase (I wish to delete the syslog settings) in the text box if you still wish to delete the syslog settings.
3. Enter or copy/paste the confirmation phrase in the text box.
4. Click **Delete**.

Configuring Tenant Password and Revoking Admin Consent (for Service Principal)

Note

The **Tenant** tab is available in the **Settings** page only if you have configured to use CCKM as a service principal.

The **Tenant** tab in the **Settings** page allows you to change your tenant password that is associated with the use of CCKM as a service principal.

Note

The **Tenant** tab is available in the **Settings** page only if you have configured to use CCKM as a service principal.

The **Tenant** tab also allows you to revoke the administrator consent, which you (as the administrator user) had provided during the initial login into CCKM for Azure Key Management (using CCKM as a service principal). See ["Access CCKM for Azure" on page 118](#), for more information about providing your administrator consent. If you revoke the administrator consent and then logout of CCKM, you will receive an error message when you attempt to log back into CCKM. The message indicates that the login failed due to having entered an incorrect tenant name or the given tenant not having granted permissions to CCKM (to be used as a service principal). You must provide the administrator consent again to login into CCKM. Click on the "admin consent" link (indicated by "here" in blue text at the top CCKM login dialog box) after which the CCKM Admin Consent dialog box is displayed.

Change Tenant Password

To change a tenant password that is associated with CCKM used as a service principal:

1. In the **Settings** page, select the **Tenant** tab. The **Tenant** dialog box displays.
2. Enter the new tenant password in the **New Tenant Password** box.
3. Reenter the new tenant password in the **Confirm Tenant Password** box.
4. Click **Save**.

Revoke Admin Consent

To revoke your administrator consent that is associated with CCKM used as a service principal:

1. In the **Settings** page, select the **Tenant** tab. The **Tenant** dialog box displays.
2. Deselect the **Granted Permission to this CCKM** box to revoke your administrator consent. By default, this box is checked.
3. Click **Save**.

About

Use the **About** tab to view the release number of the CCKM you are running.

Chapter 15: CCKM for Google Key Management

Overview

CCKM provides support for managing Google Cloud customer-managed encryption keys (CMEK). CMEK are used to encrypt data at rest within a Google Cloud project. In addition, several Google Cloud services offer the ability to protect data using encryption keys managed by customers within the Cloud Key Management System (KMS). CCKM can control the lifecycle of these keys by automatically or manually rotating CMEK. It also controls Google's ability to decrypt data at rest by disabling the key. Data is protected using a key that meets specific locality requirements using either one of the supported key sources (Data Security Manager (DSM) or CipherTrust Manager) with the CCKM solution. Additionally, CCKM can manage CMEK lifecycle in an automated way using Google Service account for REST API authentication.

Note

This documentation assumes that you are familiar with using Google Cloud Platform, Google Cloud KMS, and Google Identity and Access Management (IAM). For details about these Google technologies, refer to the Google Cloud documentation at <https://cloud.google.com/docs>.

Google Cloud IAM

Using Google Cloud's Identity and Access Management (IAM) allows you to manage access to Google Cloud resources by granting access to these resources. By defining the identity, role, and resource(s) in IAM to which to be given access, you are able to manage access to Google Cloud resources. Access permissions are grouped into roles and an authenticated Google member is granted at least one role to access to the resources.

IAM has three parts as described in the following sections.

Member

A member can be:

- Google Account (for end users)
- Service account (for apps, such as CCKM, and virtual machines)

- Google group (can contain multiple user and service accounts)
- G Suite domain
- Cloud Identity domain

An email address associated with a user, service account, or Google group is a member's identity. The G Suite and Cloud Identity domains each use the associated domain name for its identity.

CCKM supports the use of Google user, group, and service accounts. You will need the user account to login to CCKM UI, and you will need service account to authenticate to CCKM REST API.

Roles

A role is a collection of permissions. There are three kinds of roles in Cloud IAM:

- Primitive roles: Owner, Editor, Viewer.
- Predefined roles: Predefined finer-grained access control roles. For your user account or service account to use CCKM, you need to grant Project Browser and Cloud KMS Admin roles to the account. Note that the Cloud KMS admin role grants all the permissions required to use CCKM. If your project belongs to an organization, then it is recommended you grant Organization Viewer role to your accounts. Granting this role allows you to view the organization name to which your user or service account belongs in CCKM. Otherwise, you are only able to view the organization ID associated with your user or service account.
- Custom roles: User defined roles (*recommended*). If you wish to grant specific permissions to users or groups to meet your specific requirements, then create custom roles. For example, one user or group should only be able to view keys but not perform any key operations. Another user or group should only be able to list keys and perform any operation with the exception of deleting key versions. See [Table 15-1: "\[CCKM Action Mapping to IAM KMS Permissions\]" below](#) for the permissions that are required for each of the supported CCKM actions. See ["Create Custom Roles" on page 53](#) for information on how to create custom roles.

Table 15-1: [CCKM Action Mapping to IAM KMS Permissions]

CCKM Action	Cloud IAM KMS Permissions
Add key version import	• cloudkms.importJobs.create • cloudkms.importJobs.setIamPolicy • cloudkms.importJobs.get • cloudkms.importJobs.useToImport • cloudkms.cryptoKeyVersions.create • cloudkms.cryptoKeys.update
Add key version native	• cloudkms.cryptoKeyVersions.create • cloudkms.cryptoKeys.update
Authenticate	• resourceManager.organizations.get • resourceManager.projects.get
Cancel schedule delete key material	cloudkms.cryptoKeyVersions.restore
Create key	cloudkms.cryptoKeys.create
Rotate key import	• cloudkms.importJobs.create • cloudkms.importJobs.setIamPolicy • cloudkms.importJobs.get • cloudkms.importJobs.useToImport • cloudkms.cryptoKeyVersions.create • cloudkms.cryptoKeys.update

Table 15-1: [CCKM Action Mapping to IAM KMS Permissions] (continued)

CCKM Action	Cloud IAM KMS Permissions
Rotate key native	- cloudkms.cryptoKeyVersions.create - cloudkms.cryptoKeys.update
Schedule delete key material	cloudkms.cryptoKeyVersions.destroy
Synchronize	- cloudkms.keyRings.list - cloudkms.keyRings.getIamPolicy - cloudkms.cryptoKeys.getIamPolicy - cloudkms.cryptoKeys.list - cloudkms.cryptoKeyVersions.list
Update key	cloudkms.cryptoKeys.update
Update key version	- cloudkms.cryptoKeys.update - cloudkms.cryptoKeyVersions.update
Upload key	- cloudkms.cryptoKeys.create - cloudkms.importJobs.create - cloudkms.importJobs.setIamPolicy - cloudkms.importJobs.get - cloudkms.importJobs.useToImport - cloudkms.cryptoKeyVersions.create - cloudkms.cryptoKeys.update

For more information about Google Cloud roles, see [Understanding Roles within Google's IAM](#).

Resource

Google Cloud resources are organized hierarchically:

- Organization: root node of the hierarchy
- Folders: children of the organization
- Projects: children of the organization or of a folder
- Resources: descendants of projects

A Cloud IAM policy grants a member permissions to a resource. Google Cloud KMS permissions can be granted on the following types of resources:

- **project** (*not recommended*): a member that is granted a role or one permission on a project will be given that privilege on all resources contained in the project. Resources contained in a project can be KMS resources or other service resources. KMS resources are key rings and all crypto keys contained in those key rings.
- **key ring**: a member that is granted a role or one permission on a key ring will be given that privilege on all crypto keys contained in the key ring.
- **crypto key**: a member that is granted a role or one permission on a crypto key will be given that privilege on all crypto key versions contained in the key.

About Google Cloud Keys

Google Cloud KMS stores cryptographic keys in a hierarchical structure. Here are levels starting from the top:

- Project
- Location
- Key ring
- Key
- Key version

When you create a key in Google Cloud KMS, you define the purpose and the algorithm of that key (see [Table 15-2: "\[KMS Keys\]" below](#) for each of the available algorithms per key purpose). You have the option to change the algorithm when you create a new key version (depending on the scope of its purpose.). However, you cannot change the key purpose after a key is created.

Google Cloud KMS provides the following key purposes:

- ENCRYPT_DECRYPT (used in Symmetric encryption)
- ASYMMETRIC_SIGN (used in Asymmetric signing)
- ASYMMETRIC_DECRYPT (used in Asymmetric encryption)

The protection level, which you cannot change once the key is created, indicates how the cryptographic operations are performed. Google Cloud KMS provides the following protection levels:

- Software: software is used for cryptographic operations
- HSM: an HSM is used for cryptographic operations
- EXTERNAL (*Not currently supported in CCKM*): An external key manager stores the key used in the cryptographic operations. Only applicable to symmetric encryption.

For each key type (and subtype), the following table provides the key purpose and supported algorithm(s) and protection levels.

Table 15-2: [KMS Keys]

Key Type & Subtype	Key Purpose	Supported Algorithms	Protection Level
Symmetric <i>n/a</i>	ENCRYPT_DECRYPT	GOOGLE_SYMMETRIC_ENCRYPTION	SOFTWARE HSM
Asymmetric <i>signing</i>	ASYMMETRIC_SIGN	• EC_SIGN_P256_SHA256 • EC_SIGN_P384_SHA384 • RSA_SIGN_PSS_2048_SHA256 • RSA_SIGN_PSS_3072_SHA256 • RSA_SIGN_PSS_4096_SHA256 • RSA_SIGN_PSS_4096_SHA512 • RSA_SIGN_PKCS1_2048_SHA256 • RSA_SIGN_PKCS1_3072_SHA256 • RSA_SIGN_PKCS1_4096_SHA256 • RSA_SIGN_PKCS1_2048_SHA512	SOFTWARE HSM

Table 15-2: [KMS Keys] (continued)

Key Type & Subtype	Key Purpose	Supported Algorithms	Protection Level
Asymmetric <i>encryption</i>	ASYMMETRIC_ENCRYPT	• RSA_DECRYPT_OAEP_2048_SHA256 • RSA_DECRYPT_OAEP_3072_SHA256 • RSA_DECRYPT_OAEP_4096_SHA256 • RSA_DECRYPT_OAEP_4096_SHA512	SOFTWARE HSM

Prerequisites on Google Cloud

The Google Cloud administrator must ensure the following prerequisites are met prior to configuring and accessing the Google Cloud KMS in CCKM:

- Create at least one project. For information on how to create a project, see [Creating and managing projects](#) within the Google Cloud online documentation.
- Enable Cloud Resource Manager APIs. See ["Enable Cloud Resource Manager API" on page 49](#) for more information.
- Enable IAM APIs. See ["Enable Identity and Access Management API" on page 49](#) for more information.
- Enable Cloud KMS service and create a key ring in the project. See ["Enable Cloud Key Management Service \(KMS\) API" on page 49](#) for information about enabling the Cloud KMS service.
- Create a user account and a service account. You will need the user account to login to CCKM UI, and the service account to authenticate to CCKM REST API. See ["Create Service Account" on page 51](#) for more information.
- If your Google user account belongs to an organization, ensure your security policy for Google Cloud session control is set to **Session never expires**. See ["Set Session Duration for Google Cloud Console" on page 50](#) for more information.
- Assign the roles of Project Browser and Cloud KMS Admin to the user account and service account. See ["Grant IAM Roles to User and Service Accounts" on page 52](#) for more information.
- If you will use the user account to add a service account to CCKM, assign the Service Account Key Admin role to the user account. Refer to the Google Cloud online documentation for more information.
- (Optional) If your project belongs to an organization, assign the Organization Viewer role to your user account and service account. See ["Grant IAM Roles to User and Service Accounts" on page 52](#) for more information.
- (Optional) If you wish to grant specific permissions to users or groups, then create custom roles. See ["Prerequisites on Google Cloud" above](#) table for the permissions that are required for each of the supported CCKM actions. See ["Create Custom Roles" on page 53](#) for information.
- If you need to generate CCKM reports, assign the following roles to your user account and service account:
 - Logging/Logs Viewer or Project/Viewer
 - Logging/Private Logs Viewer or Project/Owner

CCKM accesses the Admin Activity audit logs and Data Access audit logs in Google Cloud to generate reports. These audit logs must be retained at log buckets in Google Cloud. *Ensure* logs are enabled in Google Cloud.

For information about Google Cloud logs, refer to <https://cloud.google.com/logging/docs/storage>. For information about log retention periods, refer to https://cloud.google.com/logging/quotas#logs_retention_periods.

- Create OAuth2 Client ID credentials for CCKM app. Note the Client ID and secret. You will need these credentials when adding Google Cloud service to CCKM using the CCKM Admin Portal. See "[Create OAuth2 Client ID Credentials](#)" on page 50 for more information.

Access CCKM for Google Key Management

If you will use CCKM UI to manage your Google Cloud keys, then you will need to use your username and password for Google Cloud to login to the CCKM user portal. A Google Cloud service account cannot be used to login to the CCKM user portal. If you will use CCKM REST APIs to manage your Google Cloud keys, then you will need a Google Cloud service account. A Google Cloud user account cannot be used with CCKM REST APIs.

Google CCKM User Portal

The CCKM User Portal for Google Cloud contains the following menu options in the left-hand navigation bar:

- **Home:** Home page displays key operation and count metrics.
- **Keys: Google Cloud Keys** page displays key management overview and provides the functionalities to create a native key in Google Cloud KMS, upload your "BYOK" key, synchronize keys and key rings, and export the contents of the keys list into a report. Also available are the key operations you can perform for both Asymmetric and Symmetric keys and the key versions. For Asymmetric keys, the key operations of Update Key and Add Version are available. For the symmetric keys, the key operations of Update Key and Rotate Key are available. For the key versions of both types of keys, the actions of View all versions, Enable, Disable, Schedule Destroy, and Cancel Destroy are provided. Additionally, for the key versions of the Asymmetric keys, the action of Download (Public Key) is also provided.
- **Reports: All Reports** overview page links to detailed individual reports.
- **Schedule:** In **Schedule**, you can schedule automatic key rotation of Symmetric keys and schedule to add a new key version of Asymmetric keys. Additionally, you have the option to schedule key synchronization.
- **Logs: Logs** page lists individual logs that can be searched, sorted, and viewed.
- **Key Sources:** In **Key Sources**, you can create keys in CCKM to upload to Google Cloud. CCKM provides support for the use of CipherTrust Manager and DSM as key sources to generate, store, and retrieve the encryption keys that CCKM uses and manages.

Note: CCKM does not support the concurrent use of CipherTrust Manager and DSM as key sources.

- **Settings:** The **Settings** page allows you to add the email addresses of the recipients who are to receive email notifications and configure the settings for email notifications and syslog servers. You can also view the release number of the CCKM you are running from this page.

To display the context of which Key Management service you are currently logged into within CCKM, the icon associated with the Key Management service displays at the top of the left-hand navigation bar.

The arrow button at the bottom of the navigation bar allows you to expand the bar to view the names of the menu options and collapse it to view only the icons associated with the menu options. Click the arrow button to either expand or collapse the navigation bar.

On the top-right side of the CCKM portal for IBM CloudAWSAzureGoogle Cloud, the following options are available:

- **Azure Cloud Service Context Switcher:** This context switcher allows you to login into another Azure cloud service different from the current Azure cloud service into which you are currently logged. If you select the Azure cloud in which you are currently logged, the Multi-account Login/Logout window for the Azure account(s) displays. For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **AWS Login:** If you are not already logged into AWS, clicking on the AWS Login icon brings you to the AWS Password Login page where you can enter your AWS credentials to access the CCKM AWS cloud service (from the current cloud service in which you are currently logged). If you are already logged into AWS, clicking on the AWS Login icon brings you to the Multi-account Login/Logout window for the AWS account(s). For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **Google Cloud Service Context Switcher:** This context switcher allows you to login into another Google Cloud organization different from the current Google Cloud organization into which you are currently logged. If you select the Google Cloud in which you are currently logged, the **Multi-account Login/Logout** window for the Google account(s) displays. For more information about the **Multi-account Login/Logout** window, see ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).

- **Salesforce Cloud Service Context Switcher:** This context switcher allows you to login into another Salesforce cloud service different from the current Salesforce cloud service into which you are currently logged. This is Salesforce, Salesforce Government, or Salesforce Sandbox. If you select the Salesforce cloud in which you are currently logged, the Multi-account Login/Logout window for the Salesforce account(s) displays. For more information about the Multi-account Login/Logout window, refer to ["Support for Multiple accounts or Multiple Users per Cloud Service in CCKM UI" on page 32](#).
- **Logout:** Logout from CCKM.

Home

The **Home** page provides a dashboard to display key operation and count metrics.

Keys

The **Keys** page allows Cloud administrators to view all the keys and manage them within the boundary of granted permissions. Those keys that do not have List permission for the respective Cloud administrator will not be listed.

A **Search** box is available at the top left of the **Keys** page allowing for a search of a specific key by entering any one of the following parameters:

- Key Name
- Version Name
- Key Purpose
- Project Name
- Protection Level
- Template algorithm
- Label
- Version state
- Version Algorithm
- Key Material Origin

The **Advanced** tab allows you to filter your search on any or a combination of these columns displayed on the **Keys** page with the exception of the **Count** and **Action** columns:

- Key Name
- Key Ring Name
- Location
- Project ID
- Project Name
- Key Purpose
- Protection Level
- Template algorithm
- Key Material Origin
- Version State
- Version Algorithm

- Rotation Status
- Primary Version
- Label

Each of these columns are described in more detail below in this section.

To select to filter based on a column or combination of these columns from the **Keys** page, click **Advanced**. The **Filters** section displays. From the column filter drop-down menu, select the name of the column on which to filter your search. For example, select **Key Name**. In the **Search** box, enter the value on which to search (for example, **MK-createkey** as the key name) and then click **Add**. For the **Key Purpose**, **Template Protection Level**, **Template algorithm**, **Version State**, **Version Protection Level**, **Version Algorithm**, **Auto Rotate**, and **Primary Version** columns, a drop-down menu is available from which to select a value for the search. Click the down arrow, select a value from the available options, and then click **Add**. The specified search filter is then added to **Active Filters**. In the example, **Key Name: MK-createkey** is added to **Active Filters**. The results of the search displays in the **Keys** table. You can narrow your search by selecting more columns to add to the filter. To clear the filtered results, from **Active Filters**, click on the “X” (or the **Delete** button) for each of the named filters.

Available next to the **Advanced** tab is an organization drop-down menu with a list of organizations to which you have access through your granted permissions. From this menu, you can select a different organization context in which to switch. When you select an organization, the key rings that reside within the given organization display within the **Keys** page. If you have key rings that do not belong to any organization, then the option **organizations/no organization** is available from the drop-down menu. Selecting this option displays the key rings that do not belong to any organization within the **Keys** page.

At the top right of the **Keys** page, the following buttons are available:

- **Export Keys:** Allows you to export the contents of the Keys list into a report in a CSV format.
- **New Key:** Allows you to upload an external BYOK (CipherTrust Manager or DSM key) or create a native key. For information on how to upload an external BYOK or create a native key, see ["Create a Key" on page 157](#).
- **Synchronize:** Allows you to download the key rings and key metadata of all the keys that were created in Google Cloud KMS (to which you have access) into CCKM. If you have External Key Manager (EKM) keys saved in Google Cloud KMS, the key rings and key metadata of EKM keys are also downloaded to CCKM during key synchronization. For information on how to synchronize your keys, see ["Synchronize Keys" on page 167](#).

The **Show EKM** check box is also located at the top right of the **Keys** page. Selecting this check box allows you to display information about EKM keys (stored in Google Cloud KMS and downloaded to CCKM during key synchronization) on the CCKM **Keys** page. By default, this box is deselected, and EKM key information is not displayed on the **Keys** page.

Also located at the top right of the **Keys** page next to the **Synchronize** button is the **settings** (or gear) icon. Select this icon to filter which columns (with the exception of the **Actions** column) to display or hide on the **Keys** page. By default, all of the columns display with all of the check boxes for each of the available columns preselected. To hide a column, select the settings icon and then deselect the associated column check box. To display a column, ensure the associated check box is selected.

The following columns display on the **Keys** page:

Key ID: The ID of the key.

Key Ring: The ID of the key ring to which the key belongs.

Location: The name of the geographical region where your Cloud KMS key is stored and can be accessed.

Project ID: The ID of the project to which the key belongs.

Key Purpose: Defines a key's cryptographic capabilities and the algorithms that are supported for the key's version.

Protection Level: Indicates whether the key and key version are stored in Software or HSM.

Version: The version number of the key.

Version State: Indicates the status of the key version in Google Cloud KMS, which can be one of the following:

- **PENDING_GENERATION:** Key version is in the process of being generated. This state is only applicable to asymmetric keys. Once created and ready for use, the state of key version moves to the ENABLED state.
- **ENABLED:** Ready for use.
- **DISABLED:** Cannot be used. However, the key material is still available for use. You can set the state of the key version back to ENABLED to be able to use this key version again.
- **DESTROY_SCHEDULED:** Scheduled for destruction. This key version can be placed back into the DISABLED state.
- **DESTROYED:** Key version is destroyed and no longer available in the Google Cloud KMS. Included in this destruction is the key material. This key version cannot be restored.

Key Material Origin:

- If the key was uploaded from CCKM as a BYOK, then the value is INTERNAL(<source_key_name>).
- If the key was not uploaded from current CCKM as a BYOK, then the value is EXTERNAL.
- If the key material was created by Google Cloud KMS, then the value is KeyRing.

Rotation Status: Indicates whether the key is scheduled for autorotation in CCKM. AUTO is displayed in this column, if the key is scheduled for autorotation. This status *only* applies to scheduled autorotation in CCKM.

Actions: Allows you to select an action to apply to a given key or key version. To view the available actions for a key version, find the name of the key whose key version you wish to view and then expand the row to show the key versions underneath the key name. In the **Actions** column, click **Select**. The available actions are displayed. You may have to scroll through the list if you have more than two actions available for selection.

Actions available for Asymmetric keys:

- **Update Key**
- **Add Version**

Actions available for Asymmetric key versions

- **View all versions**
- **Enable**
- **Disable**
- **Schedule Destruction**
- **Schedule Destruction All Versions**
- **Cancel Destruction**
- **Cancel Destruction All Versions**
- **Download** (Public Key)

Actions available for Symmetric keys:

- **Update Key**
- **Rotate Key**

Actions available for Symmetric key versions

- **View all versions**
- **Enable**
- **Disable**
- **Schedule Destruction**
- **Schedule Destruction All Versions**
- **Cancel Destruction**
- **Cancel Destruction All Versions**

Create a Key

You have two options when you create a new key in Google Cloud KMS:

- ["Create a Native Key" on the next page](#)
- ["Upload your Own Key \(BYOK\)" on page 159](#)

Part of the process of creating a new key with either option is adding it to a key ring in a given Google Cloud location and also selecting the key's purpose. The purpose of a key defines its cryptographic capabilities and the algorithms that are supported for the key's versions. The following are the supported key purposes in Google Cloud KMS:

- **ENCRYPT_DECRYPT:** used for Symmetric encryption. This key purpose is referred to as **Symmetric encrypt/decrypt** in CCKM.
- **ASYMMETRIC_SIGN:** used for Asymmetric signing. This key purpose is referred to as **Asymmetric sign** in CCKM.
- **ASYMMETRIC_DECRYPT:** used for Asymmetric encryption. This key purpose is referred to as **Asymmetric decrypt** in CCKM.

Create a Native Key

Create a native key in a Google Cloud KMS. In the process of creating a native key in Google Cloud KMS, key material is generated by Google Cloud KMS along with key metadata from CCKM are used. After CCKM creates a native key, it displays it as **KeyRing** under the **Key Material Origin** column within the **Google Cloud Keys** page.

For more information, see the following sections:

- ["Create a Native Key \(Asymmetric Key\)" below](#)
- ["Create a Native Key \(Symmetric Key\)" on the facing page](#)

Create a Native Key (Asymmetric Key)

To create a native key that has a key purpose of **Asymmetric sign** (used for asymmetric signing) or **Asymmetric decrypt** (used for asymmetric encryption):

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, select the **New Key** button and then **Create**. The **Create Native Key** dialog box displays.
3. From the **Key Purpose** box, select one of the following options depending on whether you will use the key for asymmetric signing or asymmetric encryption:
 - **Asymmetric sign**
 - **Asymmetric decrypt**
4. From the **Version template algorithm** box, select the algorithm to be used in the key material to create the new version of the key. If you selected **Asymmetric sign** as the key purpose, then the following are your options:
 - **2048 bit RSA - PSS Padding - SHA256 Digest**
 - **3072 bit RSA - PSS Padding - SHA256 Digest**
 - **4096 bit RSA - PSS Padding - SHA256 Digest**
 - **4096 bit RSA - PSS Padding - SHA512 Digest**
 - **2048 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **3072 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **4096 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **4096 bit RSA - PKCS#1 v1.5 padding - SHA512 Digest**
 - **Elliptic Curve P-256 - SHA256 Digest**
 - **Elliptic Curve P-384 - SHA384 Digest**If no selection is made, then the default is **2048 bit RSA - PSS Padding - SHA256 Digest**.
If you selected **Asymmetric decrypt** as the key purpose, then the following are your options:
 - **2048 bit RSA - OAEP Padding - SHA256 Digest**
 - **3072 bit RSA - OAEP Padding - SHA256 Digest**
 - **4096 bit RSA - OAEP Padding - SHA256 Digest**
 - **4096 bit RSA - OAEP Padding - SHA512 Digest**If no selection is made, then the default is **2048 bit RSA - OAEP Padding - SHA256 Digest**.
5. From the **Key Ring** box, select the key ring to which to add the key.
6. In the **Key Name** box, enter the name of the key.

7. From the **Version Template Protection Level** area, select whether the key and key version will be stored in either **Software** or **HSM**. If no selection is made, then the default is **Software**.
8. (Optional) In the **Labels** boxes, enter the label name and value of the key and then click the **+** button. It is recommended you include "CCKM" in the name to reflect CCKM-associated information in the labels within Google Cloud list views and reports.
9. Click **Create**. The new key is displayed on the **Google Cloud Keys** page.

Create a Native Key (Symmetric Key)

To create a native key that has a key purpose of **Symmetric encrypt/decrypt** (used for symmetric encryption/decryption):

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, select the **New Key** button and then **Create**. The **Create Native Key** dialog box displays.
3. From the **Key Purpose** box, select **Symmetric encrypt/decrypt**.

Note: The **Version template algorithm** box is not available for modification as selecting a version template algorithm is not required when creating a native key that has a key purpose of **Symmetric encrypt/decrypt**.

4. From the **Key Ring** box, select the key ring to which to add the key.
5. In the **Key Name** box, enter the name of the key
6. (Optional) From the **Version Template Protection Level** area, select whether the key and key version will be stored in either **Software** or **HSM**. If no selection is made, then the default is **Software**.
7. (Optional) In the **Rotation Period by Google** box, enter the number of days for the key rotation period. Google Cloud performs and manages this key rotation in Google cloud. The minimum is 1, and the maximum is 36,500 days.
8. (Optional) In the **Rotation Start Date by Google**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. This box displays only if you entered a rotation period in the previous step.
9. (Optional) In the **Labels** boxes, enter the label name and value of the key and then click the **+** button. It is recommended you include "CCKM" in the name to reflect CCKM-associated information in the labels within Google Cloud list views and reports.
10. Click **Create**. The new key is displayed on the **Google Cloud Keys** page.

Upload your Own Key (BYOK)

Upload the keys created from the **Key Sources** page of CCKM to the Google Cloud KMS. These "BYOK" keys are the keys you generated from the key source you are using (CipherTrust Manager or DSM). Both of these key sources support the algorithm types of AES 256, RSA 2048, RSA 3072, and RSA 4096. Additionally, CipherTrust Manager also supports the algorithm types of EC 256 and EC 384.

For more information, see the following sections:

- ["Upload your Own Key \(BYOK\) \(Asymmetric Key\)" on the next page](#)
- ["Upload your Own Key \(BYOK\) \(Symmetric Key\)" on page 161](#)

Upload your Own Key (BYOK) (Asymmetric Key)

Note

You must have the import permissions for the Google Cloud KMS to which you wish to upload the key.

To upload your BYOK to Google Cloud KMS that has a key purpose of **Asymmetric sign** (used for asymmetric signing) or **Asymmetric decrypt** (used for asymmetric encryption):

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, select the **New Key** button and then **Upload**. The **Upload a Key** dialog box displays.
3. From the **Key Purpose** box, select one of the following options depending on whether you will use the key for asymmetric signing or asymmetric encryption:
 - **Asymmetric sign**
 - **Asymmetric decrypt**
4. (Optional) From the **Version template algorithm** box, select the algorithm to be used in the key material to create the new version of the key. If you selected Asymmetric sign as the key purpose, then the following are your options:
 - **2048 bit RSA - PSS Padding - SHA256 Digest**
 - **3072 bit RSA - PSS Padding - SHA256 Digest**
 - **4096 bit RSA - PSS Padding - SHA256 Digest**
 - **4096 bit RSA - PSS Padding - SHA512 Digest**
 - **2048 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **3072 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **4096 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **4096 bit RSA - PKCS#1 v1.5 padding - SHA512 Digest**
 - **Elliptic Curve P-256 - SHA256 Digest**
 - **Elliptic Curve P-384 - SHA384 Digest**

If no selection is made, then the default is **2048 bit RSA - PSS Padding - SHA256 Digest**.

If you selected Asymmetric decrypt as the key purpose, then the following are your options:

- **2048 bit RSA - OAEP Padding - SHA256 Digest**
- **3072 bit RSA - OAEP Padding - SHA256 Digest**
- **4096 bit RSA - OAEP Padding - SHA256 Digest**
- **4096 bit RSA - OAEP Padding - SHA512 Digest**

If no selection is made, then the default is **2048 bit RSA - OAEP Padding - SHA256 Digest**.

5. From the **Key Provider** box, select CipherTrust Manager or DSM depending on the key source you are using for the key.
6. From the **Source Key** box, select one of the available source keys. The keys available in the drop-down menu are the keys generated from CipherTrust Manager or DSM depending on the key source you are using. Enter the first three characters of the name of the key to bring it up for selection.
7. From the **Key Ring** box, select the key ring to which the key is to be added.
8. In the **Key Name** box, enter the name of the key. If you wish to use the key name you entered when you generated this key from the **Key Sources** page, select the **Use source key name** check box. The name will display in the **Key Name** box.

9. (Optional) From the **Version Template Protection Level** box, select whether the key and key version will be stored in either **Software** or **HSM**. If no selection is made, the default is **Software**.
10. (Optional) In the **Labels** boxes, enter the label name and value of the key and then click the **+** button. It is recommended you include “CCKM” in the name to reflect CCKM-associated information in the labels within Google Cloud list views and reports.
11. Click **Upload to Google Cloud**. The new key is uploaded to Google Cloud KMS and is displayed on the **Google Cloud Keys** page.

Upload your Own Key (BYOK) (Symmetric Key)

Note

You must have the import permissions for the Google Cloud KMS to which you wish to upload the key.

To upload your BYOK to Google Cloud KMS that has a key purpose of **Symmetric encrypt/decrypt** (used for symmetric encrypt/decrypt):

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, select the **New Key** button and then **Upload**. The **Upload a Key** dialog box displays.
3. From the **Key Purpose** box, select **Symmetric encrypt/decrypt**.
4. From the **Key Provider** box, select CipherTrust Manager or DSM depending on the key source you are using for the key.
5. From the **Source Key** box, select one of the available source keys. The keys available in the drop-down menu are the keys generated from CipherTrust Manager or DSM depending on the key source you are using. Enter the first three characters of the name of the key to bring it up for selection.
6. From the **Key Ring** box, select the key ring to which the key is to be added.
7. In the **Key Name** box, enter the name of the key. If you wish to use the key name you entered when you generated this key from the Key Sources page, select the **Use source key name** check box. The name will display in the **Key Name** box.
8. (Optional) From the **Version Template Protection Level** box, select whether the key and key version will be stored in either **Software** or **HSM**. If no selection is made, the default is **Software**.
9. (Optional) In the **Rotation Period by Google** box, enter the number of days for the key rotation period. Google Cloud performs and manages this key rotation in Google cloud. The minimum is 1, and the maximum is 36,500 days.
10. In the **Rotation Start Date by Google**, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. This box displays only if you entered a rotation period in the previous step.
11. (Optional) In the **Labels** boxes, enter the label name and value of the key and then click the **+** button. It is recommended you include “CCKM” in the name to reflect CCKM-associated information in the labels within Google Cloud list views and reports.
12. Click **Upload to Google Cloud**. The new key is uploaded to Google Cloud KMS and is displayed on the **Google Cloud Keys** page.

Update Key

Use **Update Key** dialog box to update the current key version of an asymmetric or symmetric key to create a *new* version of it to use. The following applies to **Update Key**:

- If the key purpose of the key you wish to update is Symmetric encrypt/decrypt, then you have the option to update the key rotation period and select a new rotation time. You also have the option to change the primary version of the key.
- If the key purpose is either Asymmetric sign or Asymmetric decrypt, then you have the option to update the Version Template Algorithm of the current key version. Changing the version template algorithm does **not** affect all of the other existing key versions of the key. This update applies to the new version of the key.
- For both asymmetric or symmetric keys, you have the option to update the Labels information.

For more information, see the following sections:

- ["Update Key \(Asymmetric Key\)" below](#)
- ["Update Key \(Symmetric Key\)" on the facing page](#)

Update Key (Asymmetric Key)

Note

Keys cannot be updated when they are in a **DESTROYED** state.

To update a key that has a key purpose of **Asymmetric sign** (used for asymmetric signing) or **Asymmetric decrypt** (used for asymmetric encryption):

1. On the **Google Cloud Keys** page, click **Update Key** in the **Action** column for a particular key. The **Update key** dialog box displays. The **Project**, **Location**, **Key Ring**, and **Key Purpose** boxes and **Version Template Protection Level** area are prepopulated with the values associated with the key. These boxes and area cannot be updated.
2. From the **Version Template Algorithm** box, select the algorithm to be used in the key material of the version of the key. If you selected Asymmetric sign as the key purpose, then the following are your options:
 - **2048 bit RSA - PSS Padding - SHA256 Digest**
 - **3072 bit RSA - PSS Padding - SHA256 Digest**
 - **4096 bit RSA - PSS Padding - SHA256 Digest**
 - **4096 bit RSA - PSS Padding - SHA512 Digest**
 - **2048 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **3072 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **4096 bit RSA - PKCS#1 v1.5 padding - SHA256 Digest**
 - **4096 bit RSA - PKCS#1 v1.5 padding - SHA512 Digest**
 - **Elliptic Curve P-256 - SHA256 Digest**
 - **Elliptic Curve P-384 - SHA384 Digest**

If you selected Asymmetric decrypt as the key purpose, then the following are your options:

- **2048 bit RSA - OAEP Padding - SHA256 Digest**
- **3072 bit RSA - OAEP Padding - SHA256 Digest**
- **4096 bit RSA - OAEP Padding - SHA256 Digest**

- **4096 bit RSA - OAEP Padding - SHA512 Digest**

3. (Optional) In the **Labels** boxes, enter the label name and value of the key and then click the **+** button.
4. Click **Update**.

Update Key (Symmetric Key)

Note

Keys cannot be updated when they are in a **DESTROYED** state.

To update a key with a key purpose of **Symmetric encrypt/decrypt** (used for symmetric encrypt/decrypt):

1. On the **Google Cloud Keys** page, click **Update Key** in the **Action** column for a particular key. The **Update key** dialog box displays. The **Project**, **Location**, **Key Ring**, **Key Purpose**, and **Version Template Algorithm** boxes and **Version Template Protection Level** area are prepopulated with the values associated with the key. These boxes and area cannot be updated.
2. (Optional) In the **Rotation Period by Google** box, enter the number of days for the key rotation period. Google Cloud performs and manages this key rotation in Google Cloud. The minimum is 1, and the maximum is 36,500 days.
3. (Optional) In the **Rotation Start Date by Google** box, select a start date and time from a date and time selector by clicking the calendar button to the right of the box. The time is based on a 12-hour clock and the A.M./P.M. modifiers. This box displays only if you entered a rotation period in the previous step.
4. (Optional) To set a version of this key as the primary version, select the **Set as Primary Version** check box and then select the version number from the drop-down menu.
5. (Optional) In the **Labels** boxes, enter the label name and value of the key and then click the **+** button.
6. Click **Update**.

Rotate a Key

CCKM supports both scheduled rotation (or autorotation) and manual rotation of *symmetric* keys within Google cloud. When a key is rotated in CCKM for Google Cloud or in Google Cloud KMS, new key material is added to the key and the new version of the key is set as the primary key version. It is the primary key version of the key that Google Cloud KMS uses to encrypt data.

When you rotate a symmetric key, the following applies:

- Any data that was encrypted with previous versions of the key is not automatically re-encrypted.
- Existing key versions are not automatically disabled or destroyed.

Google Cloud KMS does **not** support autorotation and manual rotation of asymmetric keys. However, CCKM does provide this support partially. With either autorotation or manual rotation of asymmetric keys in CCKM, new key material is added to the key to create a new key version through the use of the **Add Version** action available on the **Google Cloud Keys** page. *However*, to begin using the new key version for either signing or encryption, you are required to take additional steps. Part of these additional steps includes distributing the public key of the new key version. CCKM provides support for downloading the public key of the new key version that you can distribute. For information about these additional steps, refer to [Considerations for Asymmetric Keys](#) within the online documentation for Google cloud. For more information about downloading a public key of a new key version of an asymmetric key, see "[Download Public Key \(Asymmetric Key Only\)](#)" on page 171.

Autorotation of a symmetric or an asymmetric key requires that this feature be configured in the **Schedules** page prior to enabling the feature from the **Google Cloud Keys** page. See ["Schedule Key Rotation" on page 174](#) for more information about scheduling key rotation.

For more information, see the following sections:

- ["Manually Rotate a Key \(Symmetric Key\)" below](#)
- ["Enable Autorotation of Key \(Symmetric Key\)" below](#)
- ["Manually Rotate a Key \(Add New Key Version\) \(Asymmetric Key\)" on the facing page](#)
- ["Enable Autorotation of Key \(Add New Key Version\) \(Asymmetric Key\)" on page 166](#)

Manually Rotate a Key (Symmetric Key)

Manually rotating a symmetric key allows CCKM to add new key material to the selected key and set the new key version as the primary key version to be used for encrypting data.

After a new key version is generated, it will be added to the list of key versions as a primary version on the **Google Cloud Keys** page.

Note

During the rotation of a symmetric key, the template protection level that you initially configured for the key is used to generate the new key version.

To manually rotate a symmetric key:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the key to manually rotate.
3. Select **Rotate Key** from the **Actions** drop-down menu. The **Rotate Google Cloud Key** dialog box is displayed. The **Version Algorithm** box is prepopulated with the algorithm of Symmetric encrypt/decrypt.
4. From **Key Provider**, select the key provider (also known as key source) from which to generate the new key material for the key. Two options of the three displayed are available for selection (the current key source you are currently using and Native):
 - **DSM**—Key is to be generated from DSM.
 - **CipherTrust Manager**—Key is to be generated from CipherTrust Manager.
 - **Native**—Key is to be generated natively in the designated Google Cloud KMS using the CCKM UI. Note that this option is equivalent to generating a key in the Google Cloud portal.
5. From the **Source Key** box, select the source key to use for the new key version. This box displays only if you selected either **DSM** or **CipherTrust Manager** in the previous step.
6. Click **Rotate**.

Enable Autorotation of Key (Symmetric Key)

Enabling autorotation of a symmetric key allows CCKM, at a scheduled time, to add new key material to the selected key and set the new key version as the primary key version to be used for encrypting data.

After a new key version is generated, it will be added to the list of key versions as a primary version on the **Google Cloud Keys** page.

Note

During the rotation of a symmetric key, the template protection level that you initially configured for the key is used to generate the new key version.

To enable autorotation of a symmetric key:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the key to autorotate.
3. Select **Rotate Key** from the **Actions** drop-down menu. The **Rotate Google Cloud Key** dialog box is displayed.
4. Select the **Auto Rotate** tab. The **Auto Rotate** dialog box is displayed. The **Version Algorithm** box is prepopulated with the algorithm of Symmetric encrypt/decrypt.
5. From **Enable autorotation on this key?**, select **On** to enable the autorotation of this key. By default, this toggle is initially set to **Off**.
6. From the **Schedule** drop-down menu, select a rotation schedule to which to apply to this key. Any key-rotation schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.
7. From **Key Provider**, select the key provider (also known as key source) from which to generate the new key material for the key. Two options of the three displayed are available for selection (the current key source you are currently using and Native):
 - **DSM**—Key is to be generated from DSM.
 - **CipherTrust Manager**—Key is to be generated from CipherTrust Manager.
 - **Native**—Key is to be generated natively in the designated Google Cloud KMS using the CCKM UI. Note that this option is equivalent to generating a key in the Google Cloud portal.
8. Click **Submit**.

Manually Rotate a Key (Add New Key Version) (Asymmetric Key)

Manually rotating an asymmetric key allows CCKM to add new key material to the selected key to create a new key version. You are required to take additional steps to begin using the new key version for either signing or encryption.

After a new key version is generated, it will be added to the list of key versions on the **Google Cloud Keys** page.

Note

During the rotation of an asymmetric key, the template protection level that you initially configured for the key is used to generate the new key version.

To add a new version of an asymmetric key to the key:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the asymmetric key to which to add a new version.
3. Select **Add Version** from the **Actions** drop-down menu. The **Add Version for Google Cloud Key** dialog box is displayed.

4. From **Key Provider**, select the key provider (also known as key source) from which to generate the new key material for the new key version. Two options of the three displayed are available for selection (the current key source you are currently using and Native):
 - **DSM**—Key is to be generated from DSM.
 - **CipherTrust Manager**—Key is to be generated from CipherTrust Manager.
 - **Native**—Key is to be generated natively in the designated Google Cloud KMS using the CCKM UI. Note that this option is equivalent to generating a key in the Google Cloud portal.
5. (Optional) From the **Version Algorithm** box, select the algorithm to use for the new key version. This box is prepopulated with the algorithm from the template version algorithm initially configured for the key. If you selected either **DSM** or **CipherTrust Manager** as the key provider, you have the option of changing the version algorithm. If you selected **Native**, you do not have the option to change the version algorithm.
6. From the **Source Key** box, select the source key to use for this new key version. This box displays only if you selected either **DSM** or **CipherTrust Manager** as the key provider.
7. Click **Add Version**.

Enable Autorotation of Key (Add New Key Version) (Asymmetric Key)

Enabling autorotation of an asymmetric key allows CCKM, at a scheduled time, to add new key material to the selected key to create a new key version. You are required to take additional steps to begin using the new key version for either signing or encryption.

After a new key version is generated, it will be added to the list of key versions on the **Google Cloud Keys** page.

Note

During the rotation of an asymmetric key, the template protection level that you initially configured for the key is used to generate the new key version.

To enable autorotation of adding a new version of an asymmetric key to the key:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the antisymmetric key to which to add a new version.
3. Select **Add Version** from the **Actions** drop-down menu. The **Add Version for Google Cloud Key** dialog box is displayed.
4. Select **Auto Rotate** tab. The **Auto Rotate** dialog box displays.
5. From **Enable autorotation on this key?**, select **On** to enable the autorotation of this key. By default, this toggle is initially set to **Off**.
6. From the **Schedule** drop-down menu, select a rotation schedule to which to apply to this key. Any key-rotation schedule you set in the **Schedules** page displays as an option for selection in the drop-down menu.
7. From **Key Provider**, select the key provider (also known as key source) from which to generate the new key material for the new key version. Two options of the three displayed are available for selection (the current key source you are currently using and Native):
 - **DSM**—Key is to be generated from DSM.
 - **CipherTrust Manager**—Key is to be generated from CipherTrust Manager.
 - **Native**—Key is to be generated natively in the designated Google Cloud KMS using the CCKM UI. Note that this option is equivalent to generating a key in the Google Cloud portal.

8. (Optional) From the **Version Algorithm** box, select the algorithm to use for the new key version. This box is prepopulated with the algorithm from the template version algorithm initially configured for the key. If you selected either **DSM** or **CipherTrust Manager** as the key provider, you have the option of changing the version algorithm. If you selected **Native**, you do not have the option to change the version algorithm.
9. Click **Submit**.

View All Key Versions

From the **Keys** page, you can access the **Key Versions** dialog box to view all the versions of a key and its associated information. At the top half of this dialog box, the following information about the selected key version is displayed: **Key**, **Organization**, **Purpose**, **Key Labels**, **Template Protection Level**, **Template Algorithm**, **Primary version**, **Creation Date**, **Rotation Period by Google**, and **Next Rotation Time by Google**. Note that the **Rotation Period by Google** and **Next Rotation Time by Google** refers to the key rotation that Google Cloud KMS manages and performs. At the bottom half of this dialog box, a list of all the key versions with the following columns is displayed: **Version**, **State**, **Algorithm**, **Created On**, **Key Material Origin**, and **Actions**. From the **Actions** column, you can select an action available to key versions to apply to a selected key version. See ["Keys" on page 154](#) for more information about the available options for **Actions**. You can display the next 5, 10, 15, 20, 25, 50, or 100 entries at the bottom of the **Key Versions** page using the **Show entries** drop down menu. You can view each available page by scrolling through the pages by clicking the less than "<" or greater than ">" symbols or by clicking on a given page number.

To view all of the key versions of a key:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the key whose key versions you wish to view.
3. Click the key name to expand the row to show the key versions underneath the key name.
4. Click **View all versions**. The **Key Versions** dialog box displays. You can scroll through list to view all of the key versions.
5. Click the **Close** button to close the **Key Versions** dialog box.

Synchronize Keys

When you initially log into the CCKM User Portal, CCKM retrieves all of the projects and project locations that meet the following criteria and saves this information to MongoDB:

- active projects
- where Google Cloud KMS is enabled
- billing is enabled
- belong to the user's current organization

CCKM *also* performs the *first* synchronization with Google Cloud KMS. During this synchronization, the key metadata of all of your Google Cloud keys from your key rings within the downloaded projects are also downloaded to CCKM and saved to MongoDB. Essentially, it is the key metadata for each of the keys that is downloaded during this first key synchronization. All of the downloaded information is available to you the next time you log back into CCKM as this information is saved to MongoDB.

If you wish to manually synchronize your keys from your projects (all or selected) and key rings from Google Cloud KMS with CCKM, you can do so using the **Synchronize** button in the **Google Cloud Keys** page. Included in the synchronizing of the keys are EKM keys (if these exists within your projects). Synchronizing your key rings is optional. By default, the **Also synchronize Key Rings** check box within the **Synchronize Keys** dialog box is

deselected. When this box is deselected, synchronization does not include downloading your key rings. In this case, only key metadata of the keys from the key rings that were *previously* downloaded to CCKM during the last synchronization will be downloaded. When this box is selected, then all of your key rings are downloaded including new ones that may have been added to your projects within Google Cloud KMS since the last synchronization of key rings took place. In addition, key metadata of all of your keys are also downloaded as part of the synchronization.

Note

If you do not select the **Also synchronize Key Rings** check box, the permissions on the saved key rings are retrieved during key synchronization even though your key rings are not downloaded.

You have the option to schedule key synchronization, which you perform in the **Schedules** page. See ["Schedule Key Synchronization" on page 175](#) for more information.

To synchronize your keys and (optionally) key rings from selected projects:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. From the **Google Cloud Keys** page, click **Synchronize**. The **Synchronize Key** dialog box displays.
3. Under **Select projects to synchronize**, select the **Select All** check box to select all of your projects. To deselect a project, click the **X** next to the project name. You can also click in the **Select projects to synchronize** box and bring up the list of projects from which you can select a project.
4. (Optional) If you wish to also synchronize your key rings, select the **Also synchronize Key Rings** check box.
5. Click **Synchronize**.

Disable or Enable Key Version

You have the option to disable a key version in CCKM. Any key version that is disabled has a version state of **DISABLED** as displayed in the **Version State** column on the **Google Cloud Keys** page. After a key version is disabled, any data that was encrypted using the given key version cannot be accessed. Essentially, the key version can no longer be used for cryptographic operations. However, the key material of the disabled key version is still available for use. You can re-enable a key version and set its version state back to **ENABLED** so that you can use this key version again.

For more information, see the following sections:

- ["Disable Key Version" below](#)
- ["Enable Key Version" on the facing page](#)

Disable Key Version

To disable a key version:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the key whose key version you wish to disable.
3. Click the key name to expand the row to show the key versions underneath the key name.
4. Click **View all versions**. The **Key Versions** dialog box displays. Scroll through the list to view the information for each version.
5. Find the key version you wish to disable.
6. Select **Disable** from the **Actions** drop-down menu.

Enable Key Version

To re-enable a key version that is in a DISABLED version state:

1. In the CCKM portal, in the left navigation bar, select **Keys**.
2. On the **Google Cloud Keys** page, find the name of the key whose key version you wish to enable.
3. Click the key name to expand the row to show the key versions underneath the key name.
4. Click **View all versions**. The **Key Versions** dialog box displays. Scroll through the list to view the information for each version.
5. Find the key version you wish to enable
6. Select **Enable** from the **Actions** drop-down menu.

Schedule (or Cancel) Destruction of Key Version or All Key Versions

CCKM supports the scheduling of a key version for destruction in Google Cloud KMS. A key version that is scheduled for destruction has a version state of **Scheduled for destruction** as displayed in the **Version State** column on the **Google Cloud Keys** page. Destroying a key version equates to destroying the version's key material. After destruction, the key version and the key material cannot be recovered. Google Cloud performs the key version destruction after 24 hours has elapsed. After a key version is destroyed, any data that was encrypted using the given key version cannot be accessed.
